*Among the Contributors to the Tenth Volume of the Revised Edition are the following:*

- Prof. CLEVELAND ABBE, Washington, D. C.  
MAGNET.
- PAUL ARPIN, late Editor of the "Courrier des États-Unis," New York.  
LA HARPE, JEAN FRANÇOIS DE.  
LAVOISIER, ANTOINE LAURENT.  
LEDRU-ROLLIN, ALEXANDRE AUGUSTE.
- WILLARD BARTLETT.  
MADRAS.
- Prof. C. W. BENNETT, D. D., Syracuse University.  
LEE, JESSE.  
LEE, LUTHER.  
MCKENDRIE, WILLIAM.
- JULIUS BING.  
LONDON,  
MACMAHON, Marshal, President of France,  
and other articles in biography, geography, and history.
- FRANCIS C. BOWMAN.  
LUCCA, PAULINE.  
MACFARREN, GEORGE ALEXANDER.  
MADRIGAL.
- EDWARD L. BURLINGAME, Ph. D.  
KRASINSKI, ZYGMUNT NAPOLEON, Count,  
LEWES, GEORGE HENRY,  
LEWES, MARIAN EVANS (GEORGE ELIOT),  
and other articles in biography and history.
- ROBERT CARTER.  
LOUIS XIV., XV., and XVI.,  
MACHIAVELLI, NICCOLÒ,  
MADAGASCAR,  
and other articles in biography and history.
- JOHN D. CHAMPLIN, Jr.  
LAMARTINE, ALPHONSE MARIE LOUIS DE,  
LIBRARY,  
MAGIC,  
and articles in biography and history.
- Prof. E. H. CLARKE, M. D., Harvard University.  
KINO,  
KOOSSO,  
LIME, MEDICAL USES OF,  
and other articles in materia medica.
- JOHN ESTEN COOKE, Richmond, Va.  
LEE, RICHARD HENRY.  
LEE, ARTHUR.  
MADISON, JAMES.
- Hon. T. M. COOLEY, LL. D., Michigan University, Ann Arbor.  
LAWYER,  
LEX LOCI,  
LIMITED LIABILITY,  
and other legal articles.
- Prof. J. C. DALTON, M. D.  
LEE, CHARLES ALFRED,  
LIVER,  
LONGER, FRANÇOIS ACHILLE,  
and other medical and physiological articles.
- EDWARD F. DE LANCEY.  
LOWE, Sir HUDSON.
- EATON S. DRONE.  
LACE,  
LAFAYETTE COLLEGE,  
and articles in American geography.
- Prof. THOMAS M. DROWN, M. D., Lafayette College, Easton, Pa.  
LEAD.
- E. A. DUYCKINCK.  
LIEBER, FRANCIS.
- ROBERT T. EDES, M. D., Harvard University.  
Articles in materia medica.
- LOUIS ELSBERG, M. D.  
KIRCHHOFF, GUSTAV ROBERT.
- W. M. FERRISS.  
LAMAISM.  
LEONARDO DA PISA.
- Gen. W. B. FRANKLIN, Hartford, Conn.  
LIGHTHOUSE.
- ALFRED H. GUERNSEY.  
LEE, ROBERT EDWARD,  
LITHOGRAPHY,  
MCLELLAN, GEORGE BRINTON,  
and other articles in biography and history.
- J. W. HAWES.  
LABRADOR,  
LOUISIANA,  
LOWELL (city),  
and other articles in American geography.
- Hon. CHARLES C. HAZEWELL, Boston, Mass.  
MACAULAY, THOMAS BABINGTON.
- M. HEILPRIN.  
KLAPKA, GYÖRGY.  
KOSSUTH, LAJOS.  
MACEDONIA.
- CHARLES L. HOGEBOOM, M. D.  
LIGHT.
- Prof. F. M. HUBBARD, D. D., University of North Carolina, Chapel Hill.  
MACON, NATHANIEL.
- Prof. T. STERRY HUNT, LL. D., Mass. Inst. of Technology, Boston.  
LESLEY, JOHN PETER.  
LOGAN, Sir WILLIAM EDMOND.
- ROSSITER JOHNSON.  
LAKE DWELLINGS,  
LINCOLN, ABRAHAM,  
and other articles in biography and geography.
- R. M. KELLY, Louisville, Ky.  
LOUISVILLE.
- Prof. S. KNEELAND, M. D., Mass. Inst. of Technology, Boston.  
LEOPARD,  
LOBSTER,  
LOCUST,  
and other articles in zoölogy.

CONTRIBUTORS TO THE TENTH VOLUME.

- Rev. C. PORTERFIELD KRAUTH, D. D., University of Pennsylvania, Philadelphia.  
LUTHERAN CHURCH.
- CHARLES G. LELAND.  
LEPSIUS, KARL RICHARD.
- Rev. SAMUEL LOCKWOOD, Freehold, N. J.

THE

AMERICAN CYCLOPÆDIA.

KINGLET

**KINGLET** (*regulus cristatus*, Ray), a well known European bird, often called golden-crowned warbler and wren. It is  $3\frac{1}{2}$  in. long, yellowish olive-green above and yellowish gray below, with an orange-yellow crest bordered on each side with black. Though a permanent resident in Great Britain, considerable numbers come from the north in winter; they are fond of fir woods, very sociable with the titmice and creepers, hopping actively from

KING'S

the ruby-crowned and golden-crested kinglet or wren, the *R. calendula* and *satrapa* of Lichtenstein, the former with a concealed crimson and the latter with an orange-red crown.

**KINGMAN**, a S. county of Kansas, recently formed, and not included in the census of 1870; area, 540 sq. m. It is intersected by the Ne-ne Squaw river.

**KINGS**, a S. E. county of New York, forming the W. extremity of Long Island; area, 72 sq. m.; pop. in 1870, 419,921. It lies between the East river and New York harbor and the Atlantic ocean, embracing several small islands adjacent to the coast. A range of drift hills, from 50 to 300 ft. above tide water, crosses it from S. W. to N. E. The soil is a light sandy loam, capable of varied cultivation. The South Side railroad of Long Island, the Brooklyn, Bath, and Coney Island railroad, and the Brooklyn Central branch of the Long Island railroad pass through it. The chief productions in 1870 were 44,600 bushels of Indian corn, 547,375 of potatoes, and 2,057 tons of hay. There were on farms 1,241 horses, 16 mules and asses, 1,148 milch cows, 67 other cattle, and 750 swine. There are numerous manufacturing establishments, chiefly in Brooklyn, the county seat. In 1873 a proposition for the incorporation of the county towns with the city of Brooklyn was submitted to a popular vote, which resulted adversely.

**KING'S**. I. A S. central county of New Brunswick, Canada, drained by the St. John river; area, 1,408 sq. m.; pop. in 1871, 24,593, of whom 10,841 were of Irish, 8,279 of English, 2,705 of Scotch, and 1,136 of German descent. It is traversed by the European and North American and the Intercolonial railways. The surface is diversified by a succession of hills, some of which, as the Pisgah, Piccadilla, and Moose hills, rise to a considerable height. The whole county, with its large tracts of intervals and meadow, bays, and rivers, presents a varied

1. Golden-crowned Kinglet (*Regulus cristatus*). 2. Ruby-crowned Kinglet (*Regulus calendula*).

branch to branch and clinging in various positions to the twigs in search of small insects. The nest is neat and cup-shaped, made of moss and lined with feathers, so suspended from three or four twigs that the branch shelters the opening; the eggs are six to ten; the female is very bold when hatching, and both sexes are very attentive to the young; the song is soft and pleasing. There are two nearly allied species of this genus in North America:

and somewhat romantic landscape, and it is one of the best agricultural counties of the province. Iron ore of fine quality is abundant. Coal exists, but has not yet been mined. Limestone and gypsum are plentiful, and there are many mineral springs. Capital, Hampton.

**II.** A S. W. county of Nova Scotia, Canada, situated on the bay of Fundy and Minas basin; area, 812 sq. m.; pop. in 1871, 21,510, of whom 14,392 were of English, 3,755 of Irish, and 1,841 of Scotch descent. It is traversed by the Windsor and Annapolis railway. The coast line is broken and picturesque, but the borders of the rivers Annapolis, Gaspereaux, Cornwallis, Cunard, Habitant, and Pereau are flat, with large tracts of the richest alluvial deposits. The principal settlements are on those streams and on the route from Halifax to Annapolis. The Cornwallis river will admit steamers of light draft for upward of 20 miles. The soil is fertile, and the county contains iron ore, copper, silver, and slate. Capital, Kentville. **III.** The E. county of Prince Edward Island, Canada; area, 644 sq. m.; pop. in 1871, 23,068. It is traversed by the Prince Edward Island railway. Its coasts are deeply indented by bays and inlets, and lined with settlements. There are also many villages in the interior. Capital, Georgetown.

**KING'S**, an inland county of Ireland, in the province of Leinster, bordering on Westmeath, Meath, Kildare, Queen's, Tipperary, Galway, and Roscommon counties; area, 770 sq. m.; pop. in 1871, 75,781. On the south it is somewhat broken by ramifications of the Slievebloom mountains, among the principal summits of which are Arderin, 1,733 ft. high, and Carrol hill, 1,584 ft. The principal lakes are Loughs Fin, Boara, Annaghmore, and Pallas. The Shannon, Boyne, Barrow, and Brosna are the largest rivers. The soil is of average fertility, and agriculture is devoted to the usual corn crops. There are few minerals and no important manufactures. The chief towns are Parsonstown and Tullamore.

**KINGS, Books of**, one of the chief divisions of the historical series of the canonical Scriptures. In their contents, if not entirely in style and arrangement, they are a continuation of the books of Samuel, as the latter are of that of Judges. The Hebrew Bible originally had only one book of Kings, which in the Septuagint, the Vulgate, and modern Hebrew editions is divided into two. Both versions give the title books of Kings also to the books of Samuel, and thus have four books of Kings. Commencing with the conclusion of the history of David, to which the second book of Samuel and much of the first are devoted, the books of Kings proper relate the history of the Hebrew state under Solomon and Rehoboam, of the divided state under the rival dynasties of Israel and Judah, and of the latter alone, after the captivity of the ten tribes, down to the destruction of Jerusalem by the Babylonians. They thus cover altogether a period of about 430

years, beginning with about 1015 B. C. Some chapters dwell with special interest on the acts of the prophets Elijah and Elisha. Excepting these, the work seems to be an extract from annals of the Hebrew kings, to which reference is frequently made. The name of the author is unknown. Some suppose him to be identical with the author of Samuel, which others regard as improbable on critical grounds. He was probably a contemporary of Jeremiah, if not that prophet himself. The division of the work into two books is not founded on any intrinsic reasons. Among the best commentaries upon the book are those by Keil (1848; revised ed., 1865), Thenius (1849), and George Rawlinson (in the collection known as the "Speaker's Commentary," 1873).

**KINGSBOROUGH, Edward King**, viscount, an English archæologist, born Nov. 16, 1795, died in Dublin, Feb. 27, 1837. He is distinguished for his great work entitled "Antiquities of Mexico, comprising Facsimiles of Ancient Mexican Paintings and Hieroglyphics, together with the Monuments of New Spain by M. Dupax, with their respective Scales of Measurement, and accompanying Descriptions; the whole illustrated by many valuable inedited MSS." (9 vols. fol., London, 1831-'48). The eighth and ninth volumes were published after his death, which took place from a fever caught in a debtor's prison, where he had been temporarily confined for a resistance to an attempted imposition. The first seven volumes are estimated to have cost upward of \$300,000. The work is chiefly valuable for its generally faithful reproduction, in facsimile, of such Mexican hieroglyphical or painted records and rituals as were known to exist in the libraries and private collections of Europe. These, however, are often carelessly arranged, and the pages so confused as to be utterly unintelligible except to advanced students in American archæology. Most of the original speculations of Lord Kingsborough are exceedingly loose and crude, and mainly directed to the establishment of the hypothesis of the Jewish origin of the American Indians, or at least of the semi-civilized nations of Mexico and Central America. The ninth volume, containing the relation of Don Alva Ixtlilxochitl, is imperfect, closing abruptly without finishing the relation. Since the publication of the work of Lord Kingsborough a large number of additional Mexican MSS. or paintings have come to light, including a considerable part of those collected by Boturini, and supposed to have been lost. It has also been found, by careful collation, that the facsimiles of the work are not always critically correct.

**KINGSBURY**, a S. E. county of Dakota, recently formed and not included in the census of 1870; area, about 750 sq. m. It is intersected in the W. part by the Dakota or James river.

**KINGSLEY, Calvin**, an American clergyman, born at Annsville, N. Y., Sept. 8, 1812, died in Beyrout, Syria, April 6, 1870. He was licensed

to preach in 1837. In 1841 he graduated at Alleghany college, Meadville, Pa., united with the Erie conference of the Methodist Episcopal church, and was elected professor of mathematics in his college. The withdrawal of public funds from colleges by Pennsylvania in 1843 induced the trustees of the college to employ him to secure its endowment. After a year spent in this labor, and two years in the pastorate at Erie, Pa., he was in 1846 recalled to the college, where he remained until his election as editor of the "Western Christian Advocate" in 1856. He continued in this office till 1864, when he was elected bishop. In 1867 he visited the mission conferences of Germany and Scandinavia, which had been placed under his superintendence. In May, 1869, he started on an episcopal tour around the world. He visited the conferences on the Pacific slope, the China conference at Foochow, and the India conference at Bareilly, and had passed by way of Egypt through Palestine into Syria, when he died. Besides numerous controversial treatises on slavery and other topics, he published "Resurrection of the Human Body," "The Hermits" (12mo, Philadelphia, 1868), "Round the World, a Series of Letters" (2 vols. 16mo, Cincinnati, 1870), and two volumes of sermons.

**KINGSLEY. I. Charles**, an English clergyman, born at Holne, Devonshire, June 12, 1819. He is the son of the Rev. Dr. Kingsley, rector of St. Luke's, Chelsea, and formerly vicar of Holne. In his 14th year he was placed under the care of the Rev. Derwent Coleridge, at Ottery St. John, and at the age of 20 was sent to King's college, London, whence in 1840 he removed to Magdalen college, Cambridge. He took his bachelor's degree in 1842. After a few months' study of the law he entered the church, and in 1844 was presented to the living of Eversley in Hampshire, of which parish he had previously been curate. From the commencement of his labors in the ministry he has taken part in various efforts to ameliorate the condition of the working classes, and his "Twenty-five Village Sermons" (1844), addressed to the rustic people who formed the bulk of his parishioners, won the sympathies of those for whose benefit they were intended. His "Saint's Tragedy" (1848), a dramatic poem founded on the history of Elizabeth of Hungary, attracted attention not less from its literary merits than from its supposed enunciation of the doctrines of what was known as "Christian socialism." The revelations subsequently made by Mr. Henry Mayhew in his series of papers on "London Labor and the London Poor" caused him to join the Rev. Mr. Maurice and others in a series of interviews with artisans and laborers, the result of which was the establishment among them of coöperative associations, for the purpose of undertaking work in common and sharing the proceeds. Under the influence of these investigations he published in 1850 "Alton Locke, Tai-

lor and Poet," a novel dealing with the social and political abuses of the day with a vigor and earnestness which gained for the author the title of the "chartist parson," and fully identified him with the theories of the "Christian socialists." In a pamphlet entitled "Cheap Clothes and Nasty," published just before "Alton Locke" appeared, he had urged that public hygiene and political economy demanded that no individual man should be condemned from his birth to physical disease and moral despair. The story of "Alton Locke" was an elaboration of this plea. In like manner his romance, "Westward Ho! or the Voyages and Adventures of Sir A. Leigh, Knt." (3 vols. 8vo, 1855), is an expression of his belief that a religious soul can be truly developed only in a healthy body. His prose publications, in addition to those mentioned, include "Yeast, a Problem" (1851); "Hypatia, or New Foes with an Old Face" (2 vols., 1853); "Sermons on National Subjects preached in a Village Church" (2 vols., 1852); "Phaëthon, or Loose Thoughts for Loose Thinkers" (1852); "Alexandria and her Schools" (1854); "Sermons for the Times" (1855); "Glaucus, or the Wonders of the Shore," a little treatise on marine zoölogy and botany; "The Heroes, or Greek Fairy Tales" (1856); "Two Years Ago" (1856); "Sir Walter Raleigh and his Times;" "Good News of God" (1859); "The Water Babies," a fairy story (1863); "The Roman and the Teuton," lectures delivered at Cambridge (1864); "Hereward, the Last of the English" (1866); "The Hermits" (1867); "How and Why?" (1869); "At Last: a Christmas in the West Indies" (1871); "Plays and Puritans," and "Prose Idyls" (1873); "Westminster Sermons," and "Health and Education" (1874); and a variety of miscellaneous sermons and magazine articles. As a lyric poet he has attained a high rank by a number of pieces scattered through his prose writings and contributed to various periodicals. A collection of them, including "The Saint's Tragedy," was published in Boston in 1856, and republished in London in 1857, followed in 1858 by a volume containing "Andromeda," a hexameter poem, and other pieces. He was appointed professor of modern history at Cambridge in 1859, and after resigning his chair was made canon of Chester in 1869, and subsequently of Westminster, and chaplain to the queen. In 1872 he became editor of "Good Words." In 1873-'4 he visited and lectured in the United States. **II. Henry**, an English author, brother of the preceding, born at Holne in 1824. He studied at Oriel college, Oxford, and passed many years in Australia. Returning to England in 1858, he published a novel of Australian life entitled "The Recollections of Geoffrey Hamlyn." Since then he has written "Ravenshoe" (1861); "Austin Elliot" (1863); "The Hillyars and the Burtons" (1865); "Leighton Court" (1866); "Mademoiselle Mathilde;" "Stretton, Hetty, and

other Stories;" "Old Margaret" (1871); and "Reginald Hetheridge" (1874). He was for a time editor of the "Daily Review," and its correspondent in the Franco-German war.

**KINGSLEY, James Luce**, an American scholar, born in Windham, Conn., Aug. 28, 1778, died in New Haven, Aug. 31, 1852. He graduated at Yale college in 1799, and engaged in teaching, first in Wethersfield, and afterward in his native town. In 1801 he was appointed a tutor in Yale college, and in 1805 received the newly established professorship of the Hebrew, Greek, and Latin languages in the same institution. He was relieved of a portion of his duties in 1831, when a separate professorship of Greek was instituted, and of another portion in 1835, when a professorship of sacred literature was founded. In Latin he continued to instruct until his resignation in 1851. He published a few Latin text books, a discourse on the 200th anniversary of the founding of New Haven, a history of Yale college in the "American Quarterly Register," and a life of Ezra Stiles in Sparks's "American Biography."

**KING'S MOUNTAIN**, a post village in Gaston co., N. C., in the vicinity of which is an eminence of the same name, situated in York co., S. C., about 80 m. N. by W. of Columbia, which was the scene of a memorable conflict in the revolutionary war, Oct. 7, 1780. Immediately after the battle of Camden (August, 1780), Lord Cornwallis despatched Major Patrick Ferguson to scour the western part of South Carolina, and rejoin him at Charlotte, in Mecklenburg co., N. C. Ferguson's force was gradually increased by enlistments to 1,200 men, and the new recruits, mostly tory desperadoes of the worst stamp, committed frightful excesses upon the inhabitants of the country. In the latter part of September, when within a few days' march of Charlotte, he turned aside toward the mountains to disperse a small American force under Col. Clarke; but upon arriving at Gilbert Town, in what is now Rutherford co., N. C., he learned that a large body of "mountain men," as the frontiersmen of Georgia and the Carolinas were called, had assembled to oppose his progress. Breaking up his quarters, he pushed forward to join Cornwallis, sending expresses to inform the latter of his danger, all of whom, however, were intercepted. The patriot forces started immediately in pursuit. The main body, about 900 mounted men, marching all night, came up with Ferguson at 3 P. M. on the 7th, posted on King's mountain, a narrow stony ridge elevated about 100 ft. from the neighboring ravines, and upward of a mile in length. The Americans were formed into three bodies, the centre commanded by Cols. Campbell and Shelby, the right by Cols. Sevier and McDowell, and the left by Cols. Cleveland and Williams, which moved simultaneously from different points upon the enemy. Ferguson immediately charged Sevier and McDowell, and pushed them down the hill with the bayonet, the tories using rifles

and fowling pieces armed at the end with large knives. A flank fire from Cleveland and Williams caused him to turn against his new assailants; but the latter had scarcely been repulsed when he was confronted by the centre under Campbell and Shelby and the rallied troops of Sevier. In this manner the fight continued for upward of an hour, until the enemy, harassed on all sides by the fire of the riflemen, which was rapidly thinning their ranks, were thrown into confusion, and began to retreat along the ridge. Ferguson prepared for one final charge, and fell at the head of his regulars pierced by seven bullets, dying, according to tradition, by the hand of Col. Williams, who was also slain. His men, disheartened by his fall, surrendered to the number of nearly 800, 240 having fallen. Only 200 escaped. The Americans lost only 20 men killed, although a large number were wounded. This action did much to precipitate the downfall of British power in the south.

**KINGSTON**, a city and the county seat of Ulster co., New York, on the W. bank of the Hudson river, about 90 m. N. of New York and 55 m. S. of Albany, and on the N. bank of Rondout creek, which is navigable for 3 m. and is its harbor; pop. in 1874, about 22,000. It is the terminus of the Delaware and Hudson canal, and of the New York, Kingston, and Syracuse, and the Walkkill Valley railroads, which communicate by ferry with Rhinebeck, a station on the Hudson River railroad on the opposite bank of the river. Steamboats connect it with New York, Albany, and intermediate places. It has a wharfrage front of 4 m. Forty-three steamboats owned in the city are employed in transporting freight and passengers, and in towing. The shipment of coal, blue stone, brick, ice, cement, lime, lumber, &c., exceed 2,500,000 tons per annum. Kingston is the centre of the blue-stone or flagging trade. The quarries are scattered through a region nearly 100 m. in length, reaching from the Delaware river to the Hudson, and the stone is brought to the city by wagon, rail, and canal. Hydraulic cement, for which Ulster co. is celebrated, is mainly shipped from Kingston, amounting to a yearly aggregate of 1,500,000 barrels. The largest cement manufactory in the country, that of the Newark lime and cement manufacturing company, situated in the city, turns out 225,000 barrels yearly. The stone is obtained by tunnelling the hills which face the creek and river, and by running galleries in the layers of rock. These galleries are nearly two miles in length, and are often sunk to a depth of 200 ft. The average thickness of the layers is 30 ft., and they incline at all angles from vertical to horizontal. The city also contains four founderies and machine shops, a planing mill, a manufactory of malt, four of cigars, one of glue, a tanning and currying establishment, nine breweries, 13 carriage factories, several boat and ship-building establishments, five brick yards, five national

banks with an aggregate capital of \$1,125,000, and three savings banks. It is divided into nine wards, and is governed by a mayor and 18 aldermen. The recorder holds a police court, and there is a volunteer fire department. The streets are lighted partly with gas and partly with kerosene. The disbursements for the year ending March 9, 1874, were \$90,518 29. The bonded debt at that date amounted to \$650,660, of which \$600,660 was contracted to pay for stock in railroads. Besides the county buildings, there are the music hall, the almshouse, the city hall (in progress), and several hotels. The educational institutions, besides several large private schools, embrace a number of graded and ungraded public schools, having in 1873 46 teachers; pupils enrolled, 3,291; average attendance, 1,951. The number of children of school age (5 to 21) was 7,235; expenditures for school purposes, \$55,380, of which \$32,248 were for teachers' wages. There are one daily and five weekly newspapers, and 21 churches, viz.: Baptist, 2; Episcopal, 2; German Evangelical Lutheran, 2; Jewish, 2; Methodist, 4; Presbyterian, 2; Reformed, 3; Roman Catholic, 3; children's church, 1.—Kingston was incorporated as a city by act of March 29, 1872. It was formed from a portion of the town of the same name, and includes the greater part of the former villages of Kingston (pop. in 1870, 6,315), incorporated in 1805, and Rondout (pop. in 1870, 10,114), incorporated in 1849, and the unincorporated village of Wilbur. The first permanent settlement was made soon after 1665. The first state convention of New York adjourned from Fishkill to Kingston in February, 1777, and here framed the first constitution of the state. In September following the state legislature met here, but dispersed on the approach of a British force under Sir Henry Clinton, which on Oct. 17 plundered the village and burned every house but one.

**KINGSTON**, a city, port of entry, and the capital of Frontenac co., Ontario, Canada, situated at the head of the St. Lawrence river, where it issues from Lake Ontario, and at the mouth of Catarauqui creek, 175 m. W. S. W. of Montreal, and 150 m. E. by N. of Toronto; pop. in 1844, 6,840; in 1861, 13,743; in 1871, 12,407. The apparent decrease is due to the removal of the garrison. The city is regularly laid out, the streets crossing each other at right angles. Most of the houses are built of

blue limestone, which is quarried in the vicinity. Water is supplied partly from the river and partly from wells, some of which are impregnated with mineral substances, and the city is lighted with gas. There are many fine public buildings, among which are the city hall and market, the custom house, the court house and jail, the post office, and the mechanics' institute. The Grand Trunk railway passes within 2 m. of the city, and a freight branch extends to the harbor. A railway is in course of construction to Pembroke, 120 m. N. The harbor is deep and commodious, and is protected by Wolfe and Garden islands, which lie opposite the city at a distance of 3 m. On the west is the entrance to the bay of Quinté, and on the east the terminus of the Rideau canal, which connects the port with Ottawa. Haldimand cove, E. of the city, between Point Frederick or Navy Point and Point Henry, forms a deep and well sheltered

Kingston, Canada

haven. On both these promontories there are fortifications which command the whole harbor. Fort Henry is the principal work of defence; there are several martello towers near it, and as a military post Kingston is the strongest place in Canada after Quebec and Halifax. Steamers ply to Cape Vincent, N. Y., on the opposite bank of the St. Lawrence. The number of vessels entered from the United States for the year ending June 30, 1873, was 2,009, with an aggregate tonnage of 380,665; cleared for the United States, 1,655 vessels of 269,299 tons. The value of imports was \$3,978,459; of exports, \$1,358,202, making Kingston the second port of the province in the value of foreign commerce. Ship building and boat building are largely carried on, and there is a marine railway for repairing vessels. The other principal manufactures are of iron castings, mill machinery, steam engines, locomotives, leather, soap and candles, boots and

shoes, wooden ware, brooms, pianos, ale and beer, &c. There are three branch banks, and a loan and trust company. Kingston is divided into seven wards, is governed by a mayor, board of aldermen, and common council, and has a fire department and a police force. Among the charitable institutions are the house of industry, orphans' home, general hospital, Hôtel-Dieu hospital and orphan asylum, and house of refuge. The provincial penitentiary is about a mile W. of the city, and beyond the penitentiary is the Rockwood lunatic asylum. It is the seat of Queen's university and college (Presbyterian), with seven professors, and having an observatory connected with it; of Regiopolis college (Roman Catholic); and of a medical college, with 11 professors. There are 10 academies and schools, a diocesan library, two daily and two weekly newspapers, and 17 churches, including the Roman Catholic cathedral.—Kingston is one of the oldest places in Ontario. A settlement was begun here by the French as early as 1672, under the name of Fort Cataraqui, which was subsequently changed to Fort Frontenac. The fort was destroyed by an expedition under Col. Bradstreet in 1758, and in 1762 the place fell into the hands of the British, from whom it received its present name. It became a city in 1838, and from 1841 to 1844 was the capital of Canada.

**KINGSTON**, a maritime city and the capital of the island of Jamaica, in the county of Surrey, on the S. coast, 12 m. E. N. E. of Spanish Town, the former capital; lat.  $18^{\circ}$  N., lon.  $76^{\circ} 50'$  W.; pop. about 35,000. It is situated on the gentle slope of a branch of the Blue mountains, and stands on the N. shore of a magnificent bay defended by two forts. It is built in the form of an amphitheatre, with wide and regular streets; the houses, mostly of two stories, are solidly constructed of brick or wood, and painted green and white. The houses in the centre of the city form blocks or squares, and in the principal streets are furnished with verandas below and covered galleries above; while those in the outskirts are detached, and surrounded by delightful gardens. Besides the English church, the handsomest in the town, there are a Scottish, some Methodist, and several Roman Catholic churches, and two synagogues; but neither these nor the other public edifices, such as the theatre, hospital, courthouse, new penitentiary, workhouse, commercial subscription rooms, barracks, and jail,

possess any architectural beauty. The bay or roadstead has a mean depth of six fathoms, and affords good mooring ground for 1,000 vessels of any size. It is bounded S. by a long and narrow strip of land named the Palisades, on the extreme point of which stands Port Royal, the naval station; but the entrance is considerably narrowed by a sand bank stretching in front of Fort Augusta, and the shelter is imperfect, owing to the lowness of the coast. The environs are covered with fine sugar plantations, interspersed with picturesque villas. The region to the west is extremely marshy, and to the east rises Long mountain. The climate is hot, and generally unhealthy for Europeans; the thermometer ranges from  $70^{\circ}$  to  $95^{\circ}$ ; but alternate sea and land breezes in the morning and evening temper in a measure the almost suffocating atmosphere. The situation of Kingston, between Europe and the centre of the American continent, has rendered it an

Kingston, Jamaica.

important commercial entrepot. The chief exports are coffee, sugar, tobacco, dyewood, and its highly esteemed rum; and the imports mainly consist of manufactured goods, flour, wine, ale, and salted meat. The total value of the exports for the year ending Sept. 30, 1870, was \$6,315,813; of the imports, \$6,600,146. It is connected by rail with Spanish Town.—Kingston was founded in 1693, after the destruction by earthquake of Port Royal; it was made a bishopric in 1856. In February, 1782, the town was almost completely destroyed by fire; and another disastrous fire which commenced on March 29, 1862, and in which a few persons perished, destroyed property to the value of \$1,250,000. Yellow fever has at times committed fearful ravages here; and about one eighth of the population was carried off by cholera in 1850.

**KINGSTON**, a town of England. See KINGSTON-UPON-THAMES.

**KINGSTON, Elizabeth Chudleigh**, duchess of, born in 1720, died near Paris, Aug. 28, 1788. Her father, Col. Chudleigh, governor of Chelsea college, died when she was very young, leaving his family in narrow circumstances. As she grew up, her beauty and vivacity attracted much attention; and in her 18th year, by the influence of Mr. Pulteney, afterward earl of Bath, she was appointed a maid of honor to the princess of Wales, the mother of George III. At the princess's court in Leicester house she became one of the reigning toasts of the day, and among her numerous admirers was the duke of Hamilton, whose proposals of marriage she accepted, with the understanding that the nuptials should be celebrated on his return from a visit to the continent. During his absence Capt. Hervey, grandson of the earl of Bristol, became enamored of her, and with the assistance of her aunt, Mrs. Hanmer, who intercepted the letters addressed by the duke to Miss Chudleigh, succeeded in alienating her affections from his rival and in persuading her to be secretly married to himself. The day after the marriage, which took place Aug. 5, 1744, she conceived so violent a dislike for her husband that she resolved never to see him again. The duke of Hamilton soon after returned to England, and was naturally astonished that his claim to her hand should be rejected. To escape his reproaches, and those of her mother, who was a stranger to her marriage, at her apparently unreasonable rejection of this and other advantageous offers, she visited the continent, where she pursued a career of scandalous dissipation. During a residence at Berlin Frederick the Great paid her marked attentions, and at Dresden the electress loaded her with presents. Returning to England, she resumed her duties at the court, and became one of the leaders in the fashionable profligacy of the age. The marriage with Capt. Hervey, however, perpetually annoyed her, and in order to destroy all evidences of it she contrived to tear the leaf out of the parish register in which it was recorded. The death of her husband's grandfather, the earl of Bristol, having improved his prospects of succeeding to the earldom, she obtained the restoration of the leaf. Meanwhile the duke of Kingston, ignorant of her marriage, solicited her hand; and having prevailed on her husband to allow a divorce by mutual consent to be pronounced at doctors' commons, she was married a second time, March 8, 1769. The duke died four years afterward, leaving her in possession of a princely fortune on the condition that she should not again marry. Forthwith she plunged into a course of licentiousness, the censure excited by which constrained her to leave the country for a time. She sailed for Italy in her own yacht, and while living in Rome in great magnificence learned that the family of the duke of Kingston were about to establish against her a charge of bigamy on the ground that her first marriage had been declared void

by an incompetent tribunal. Her banker, who was in the interest of her adversaries, refused to advance her money to leave the country, whereupon she proceeded to his residence, pistol in hand, and extorted it from him. Upon arriving in England she found public opinion strongly against her. Foote satirized her in his "Trip to Calais," under the name of "Kitty Crocodile," which however she found means to have prohibited; but, with a vindictiveness which nothing could appease, she caused some outrageous charges to be trumped up against him, the mortification attending which so affected him that he died soon after. On April 15, 1776, the trial of the duchess came on in Westminster hall, which had been fitted up with great state for the purpose, and during the five days that it lasted attracted members of the royal family and throngs of distinguished persons. The duchess, attended by numerous counsel, addressed the peers with great energy, but was declared guilty. Thereupon she pleaded the privilege of the peerage, having now virtually become the countess of Bristol, to which title her first husband had succeeded, and thus escaped the punishment of burning on the hand, with which Dunning had threatened her. She retained her fortune, however, and the utmost efforts of her opponents were powerless to affect the validity of the late duke's will. Thenceforth she became a voluntary exile, visiting various European courts, and among others that of Catharine II. of Russia, who received her with great kindness. She ended her days at her château in the neighborhood of Paris.

**KINGSTON-UPON-THAMES**, a municipal borough, town, and parish of Surrey, England, on the E. bank of the Thames, at the mouth of the Ewell, 8 m. W. S. W. of London; pop. of the borough in 1871, 15,257. It extends about  $1\frac{1}{2}$  m. along the river, is irregularly built, and contains several interesting edifices, among which are an ancient cruciform church and a handsome town hall. In 1872 there were 18 places of worship, of which 8 belonged to the church of England. There are several endowed schools. A Roman town or station was built on the site now occupied by Kingston, and various traces of it, such as coins and other antiquities, have been brought to light. A great ecclesiastical council was held here by Egbert in 888, and many Saxon kings were crowned here.

**KINGSTOWN**, a seaport and watering place of Ireland, in the county and 7 m. by railway S. E. of the city of Dublin, on Dublin bay; pop. in 1871, 16,387. It possesses, in the words of the tidal commissioners' official report, "one of the most splendid artificial ports in the United Kingdom." The harbor of refuge, begun in 1816, from designs by Rennie, consists of two piers and a breakwater, the E. pier being 3,500 ft. long, and the W. 4,950 ft., with an entrance 850 ft. wide, and enclosing an area of 250 acres, with a depth of water of from 15 to 27 ft.; it cost £750,000. A revol-

ing light marks the entrance, lat.  $53^{\circ} 18' N.$ , lon.  $6^{\circ} 8' W.$  Kingstown is the mail packet station for communication with Dublin and Holyhead. Over 2,000 ships enter and leave the harbor annually.

**KINGTECHIN**, a town of China, in the province of Kiangsi, 100 m. N. E. of Nantchang; pop. upward of 500,000. It is an open town, containing thousands of furnaces and hundreds of factories of porcelain, the manufacture of which centres here. These works have enjoyed the special patronage of the emperors of China for more than 800 years. Stanislas Julien translated from the Chinese a history of the Kingtechin manufacture of porcelain (Paris, 1856).

**KING WILLIAM**, an E. county of Virginia, bounded N. E. by Mattapony river and S. W. by the Pamunkey; area, 270 sq. m.; pop. in 1870, 7,515, of whom 4,455 were colored. It has a rolling surface and a good soil. The Richmond and York River railroad passes through the S. E. part. The chief productions in 1870 were 68,256 bushels of wheat, 236,530 of Indian corn, 33,030 of oats, 17,045 of Irish and 8,309 of sweet potatoes, 28,850 lbs. of tobacco, and 37,095 of butter. There were 805 horses, 2,679 cattle, 1,083 sheep, and 3,856 swine; 6 flour mills, and 2 saw mills. Capital, King William Court House.

**KINIC ACID**, also called cinchonic and quinic acid, a substance obtained in combination with lime in evaporating the infusion of Peruvian bark to a solid consistence, and treating the extract with alcohol. If an aqueous decoction of cinchona bark be mixed with milk of lime until it assumes a feebly alkaline reaction, the vegetable bases and the tannic acid are precipitated, and calcic quinate remains in the liquid; this salt may be crystallized from the mother liquor by evaporation, and decomposed by the cautious addition of oxalic or of sulphuric acid. The kinic acid may then be obtained in crystals from the solution in the form of transparent, colorless, rhomboidal plates. These have a sour taste, and readily dissolve in water or alcohol. Their composition is expressed by the formula  $H_2C_6H_7O_6$ . By combining the acid with cinchonia or quinine it is restored to the saline condition in which it existed in the bark, and may thus be applied in medicine in concentrated form more nearly representing the peculiar character of the bark than in the ordinary combinations of the alkaloid with sulphuric or other mineral acid, although the therapeutic advantage of such a combination is by no means proved. Kinic acid by its presence serves to distinguish genuine barks. The method of testing is to boil  $\frac{1}{2}$  oz. of bark with a little lime, and, after pouring off and concentrating the liquor, to commence distilling it in a retort with a mixture of half its weight of sulphuric acid and peroxide of manganese. If kinic acid is present, a volatile substance called kinone or chinone, of yellow color and peculiar odor, the vapor of which is very irritating to the eyes, comes over with the first portions,

and is instantly recognized. The spurious barks having no kinic acid do not afford kinone. It has been ascertained that caffeic acid also yields kinone when treated in the manner above described. Kinic acid is said to have been found in the leaves of *vaccinium myrtillus*. It is converted in the system into hippuric acid.

**KINKEL, Johann Gottfried**, a German poet and patriot, born at Oberkassel, Aug. 11, 1815. The son of a clergyman, he studied theology and afterward philosophy, and particularly the history of art, holding professorships in each branch at the university of Bonn (1837-'48). Implicated in the revolutionary movements of 1848 and 1849, he was sentenced to 20 years' imprisonment in the fortress of Spandau. In 1850 he effected his escape with the assistance of Karl Schurz and some other devoted friends, fled to England, spent some time in the United States, and returned to London, where he engaged in teaching, lecturing, and journalism. In 1866 he was appointed professor of the history of art at Zürich. He has written lyrical poems, books on the fine arts, especially on Christian art, and miscellaneous works. New editions of his poems, in two collections, and of a number of his stories, were published at Stuttgart in 1874. He married the divorced wife of the publisher Mathieux of Cologne, who was the daughter of Prof. Mockel, and was an accomplished musician and writer on music and other subjects. She lost her life Nov. 17, 1858, by falling or throwing herself out of a window. Her posthumous works include *Hans Ibeles in London* (2 vols., 1860; 2d ed., 1874).

**KINKAJOU**. See POTRO.

**KINNEY**, a S. W. county of Texas, separated from Mexico by the Rio Grande, and drained by numerous small tributaries of that river; area, 1,400 sq. m.; pop. in 1870, 1,204, of whom 418 were colored. There is little good land, which is confined to the valleys of the Rio Grande and a few small creeks. In 1870 it produced 17,820 bushels of Indian corn. There were 15,935 cattle and 6,518 sheep.

**KINO** (sometimes incorrectly called gum kino), a name applied to various astringent vegetable extracts. These are obtained from several distinct regions, and from trees not only of different genera but of different orders, agreeing, however, in the essential characteristic of containing a large proportion of tannic acid, with more or less resin, gum, and extractive. It occurs in small fragments, or even powder, and is usually of a reddish color, with little or no odor and a bitterish astringent taste. The tannic acid which it contains is of the variety which precipitates the salts of iron a greenish black or olive color. By some chemists this kino-tannic acid is supposed to be not a distinct variety, but a combination of ordinary or gallo-tannic acid with a red coloring matter called kinic acid. Among the principal varieties are the East India kino, from the *pterocarpus marsupium*, a lofty leguminous tree

growing upon the mountains of India. This contains 95 per cent. of tannin and extractive, and 24 of red gum. West India or Jamaica kino is believed to be the product of *coccoloba uvifera*, or seaside grape, a small tree of the order *polygonaceæ*. It is possible that the same plant is the source of the South American kino. The African kino, although it is the variety to which the name was first applied, is no longer in the market. The butea gum from the dhah tree of India has been mistaken for it, and has a similar composition. Botany Bay kino is the concrete juice of *eucalyptus resinifera*, the brown gum tree of Australia, a large and lofty tree of the order *myrtaceæ*. It is said that a single tree is capable of furnishing 500 lbs. of kino in one year.—Kino is used in medicine as a powerful astringent, both internally and externally. It may be employed in the form of powder, infusion, or tincture. The last named preparation is apt to gelatinize and lose its astringency when too long kept and exposed to the air. The dose of the powder is from 10 to 30 grains; of the tincture, a teaspoonful; of the infusion, 2 or 3 oz. It is chiefly used medicinally in the treatment of diarrhœa. Passive hæmorrhages are sometimes controlled by it.

**KINROSS-SHIRE**, a S. E. county of Scotland, bordering on Fifeshire and Perthshire; area, 77 sq. m.; pop. in 1871, 7,208. Loch Leven, covering an area of 3,300 acres, and abounding in fish, occupies the centre of the county. The remainder of the surface is level and well cultivated. Its minerals are coal, limestone, and iron. The chief towns are Kinross and Milnathort, which with some manufacturing villages produce plaids, shawls, &c.

**KINGSALE**, a maritime town and parliamentary borough of Ireland, in the county and 12 m. S. by W. of the city of Cork, on the estuary of the Bandon; pop. in 1871, 5,248. It has an Episcopal and a Roman Catholic church, a convent, a Carmelite friary, two Methodist meeting-houses, a town hall, prison, workhouse, and barracks. It is chiefly supported by the resort of summer visitors and the fisheries. A railway connects it with Cork.

**KINSKY**, the name of a noble family of Bohemia, dating from the 14th century. Count FRANZ ULRICH (1634-1799), his brother WENZEL NORBERT OCTAVIAN (1642-1719), and the son of the latter, FRANZ FERDINAND (1678-1741), were prominent statesmen and diplomatists in the Austrian empire. Count FRANZ JOSEPH (1739-1805) distinguished himself in the seven years' war, in the war against Turkey (1788), and against France (1793-'6), and rose to the highest rank in the Austrian army. A new edition of his writings on military science was published in 1806-'25 (6 vols., Vienna). The present head of the junior and princely branch is FERDINAND BONAVENTURA, Prince Kinsky of Wehinitz and Tettau, born Oct. 22, 1834.

**KIOTO** (often called *Miako*, the native equivalent of the Chinese *Kioto*, capital, the real

name being HEIAN or HEIANJO), a city and long the capital of Japan, in the S. W. part of the main island, on the Kamogawa, 235 m. S. W. of Tokio (Yedo), and 25 m. N. E. of Ozaka; pop. in 1872, 567,334. It is one of the three *fu* or imperial cities of Japan. It is in a broad plain encircled by mountains which are covered with groves, gardens, temples, and pagodas. The Kamo, which flows through the city, is a stream of pure water crossed by numerous wooden bridges and a magnificent one of iron erected in 1873. The river bed is in a large extent dry in summer, and the people use it as a pleasure ground. The houses, mostly of one story, are very neat; the streets, which run at right angles, are exceedingly clean, and through many of them flow streams of pure water. It is especially famous for its temples. There are numerous monasteries and nunneries in the city, which in 1872 contained 2,413 Shinto shrines and 3,514 Buddhist temples. The now deserted palace of the mikado and the dwellings of the kugé or court nobles lie in a space enclosed by a wall of tiles and plaster, painted in longitudinal stripes of buff and white. The castle of Nijo, formerly belonging to the shogun (tycoon), is in the central part of the W. side of the city, and is now used as the town hall. Kioto is famous for its manufactures of lacquered articles, silk stuffs, porcelain, metal vases and ornaments, and decorated weapons. It contains a school of foreign languages and sciences, besides many native schools. It is connected with Tokio and Nagasaki by telegraph. The railway to Ozaka is not yet finished. Its importance as a literary centre has passed away.—From the earliest period, the capital of Japan has been fixed near or in Kioto, though it was not made the permanent capital till A. D. 794. So universally was it looked upon as the political as well as the literary and ecclesiastical centre of the empire, that the five adjacent provinces were named the *Kinai*, or home provinces, and the other portions of the empire were divided and named with reference to their direction from it, and the methods of communication by road and canal were arranged with regard to it. In 1864 a conflict, which lasted for several days, took place in and around the mikado's palace, during which nearly the whole city was burned. In 1868 the mikado took up his permanent residence in Yedo, which was thereupon called Tokio (eastern capital), while Kioto was named Saikio (western capital), a name which it now popularly retains.

**KIOWA**, a S. W. county of Kansas, recently formed, and not included in the census of 1870; area, 900 sq. m. Its N. W. corner is intersected by the Arkansas river, and it is watered by several streams.

**KIOWAS**, or *Kioways*, a tribe of North American Indians belonging to the Shoshonee family. They were first brought to notice by Lewis and Clark. Their skin lodges and hunting grounds were then on the Paducah, and with the Kas-

kaias they occupied the head waters of the Platte and Arkansas. They raised horses and traded with the Ricarees, Mandans, &c. They had obtained horses at an early period from the Spaniards, and committed frequent depredations, being great warriors and fine horsemen, though awkward on foot. They were at war with many northern tribes, especially the Pawnees, Tetans, and Sioux. They were noted for the long hair of the men, often reaching to the knees, but done up in three or four plaits, while the women were cropped short. They long hunted on the Platte, and in summer pursued the buffalo between the North fork of the Canadian and the Arkansas, but in autumn and winter pastured their immense herds on the rich grassy bottoms of the Red river. As late as 1819 they used the bow and arrow, lance and war club, and carried shields. They lived in leathern lodges, transported as they moved. The early estimates of their numbers were low, but about 1840 they were 1,800 strong. In 1839 a delegation visited St. Louis. In 1843 government made several attempts to negotiate with them, especially to liberate the white captives in their hands. There was, however, little intercourse with them till the treaty of Fort Atkinson, July 27, 1853, when for a ten years' annual payment of \$18,000 they agreed to refrain from all hostilities. They, however, resumed their depredations, and in 1858 Tohanson, or Little Mountain, defied the whites to punish them. In 1859 the Texans drove them out, and they retired between the Canadian and Arkansas rivers. The government withheld the annual payments in 1859-'60, but they made raids on Texas in retaliation. In October, 1865, a new treaty was made with the Comanches and Kiowas, Tahanson, Santanta or Sitting Bear, Black Eagle, and Lone Wolf being the principal chiefs. They claimed all the territory from the North fork of the Platte to Texas. The object was to induce them to give up their lands and take a reservation on receiving an annual payment proportioned to their numbers. The treaty of August, 1869, assigned to them and some Comanches and Apaches 3,549,440 acres in the southwest of Indian territory, on lands leased from the Chickasaws. They numbered at this time 1,928, but were restive, complained of being fed on Indian corn, and took no interest in agriculture, trampling down their own corn fields. In 1870 they killed several whites near the agency, and invaded Texas. The next year, in May, Santanta led a war party to Texas, which captured a train, killing many. Government then acted decisively. Santanta and Big Tree were arrested, and sent to Jacksborough, Texas, where they were convicted of murder and sentenced to death. This was commuted to imprisonment for life. The tribe, humbled at first, gave up horses and mules; but recovering somewhat, they threatened new raids if Santanta was not restored. At the request of the federal government Texas par-

doned the chiefs, but their hostility continued unabated. Under the treaty of 1867 they have 25 instalments of \$30,000 and \$7,500 for clothing, seeds, blacksmith, &c.; but they are very turbulent and unsettled. Their number was reported in 1873 as 2,000, and their property was estimated at \$200,000.

**KIP, William Ingraham**, an American bishop, born in New York city, Oct. 3, 1811. He studied at Rutgers college, N. J., and graduated at Yale in 1831. He first studied law, and then theology at the general theological seminary of the Episcopal church in New York, and was ordained a deacon in 1835. After some ministerial work in Morristown, N. J., and New York city, he became in 1838 rector of St. Peter's church in Albany, N. Y. In October, 1853, he was consecrated missionary bishop of the Pacific coast, and soon after bishop of the diocese of California, which post he still retains (1874). Besides numerous contributions to church periodicals, he has published "The Lenten Fast" (1843); "The Double Witness of the Church" (1844); "Christmas Holidays in Rome" (1845); "Early Jesuit Missions in North America" (1846); "Early Conflicts of Christianity" (1850); "The Catacombs of Rome" (1854); and "Unnoticed Things of Scripture" (1868). Most of these works have passed through several editions and been republished in England.

**KIPPIS, Andrew**, an English clergyman, born in Nottingham in 1725, died in London in 1795. He was educated at Northampton, in the theological seminary of Dr. Doddridge, and, after being a Unitarian pastor for some years at Boston in Lincolnshire and Dorking in Surrey, he removed in 1753 to London, where he became minister of the Unitarian chapel of Prince street, Westminster. In 1763 he became classical and philological master of Coward's theological academy, and he held a similar chair in the Unitarian institution at Hackney. His most important works are his edition of the "Biographia Britannica," which he commenced in 1777, and of which he published 5 vols.; and a "Life of Captain James Cook" (2 vols. 8vo, 1788). He also edited the works of Dr. Nathaniel Lardner and Dr. Doddridge.

**KIPTCHAK, or Kaptchak**, the name of one of the oldest Mongolian or Tartar races, and also that of the lands of S. E. Russia and W. Asia which they inhabited. Oriental authors, as Rashid ed-Din and Abulghazi Bahadur Khan, relate that while Oghuz Khan, a descendant of Turk, a son of Japhet, was fighting a bloody battle with the Kara Khatia, the wife of a general of the latter hid in a hollow tree (*kiptchak*) and gave birth to a child, who became the forefather of the horde, and the founder of the empire called Kiptchak. The Deshti Kiptchak, or desert of Kiptchak of the eastern writers, the home of many roaming tribes in the middle ages, comprised the vast steppes on the lower courses of the Dnieper, Don, Volga, and Yaik or Ural, and between the Black and Caspian

seas. In the first half of the 13th century the Mongolians founded the khanate of Kiptchak, which was synonymous with the empire of the Golden Horde, and reached from the interior of European Russia to the sources of the Sir Darya or Jaxartes. About the middle of the 15th century, after Tamerlane's invasion, Kazan, Astrakhan, and Krim or Crimea fell off from Kiptchak, and formed independent khanates. Of these the first two were soon after absorbed by Russia, but the Crimea first became subject to the Ottomans, and was not annexed by Russia till the end of the 18th century. (See MONGOLIANS.)

**KIRBY, William**, an English naturalist, born at Withnesham, Suffolk, Sept. 19, 1759, died at Barham, July 4, 1850. He graduated at Caius college, Cambridge, in 1781, took orders, and was appointed to the curacy of Barham. At the end of 14 years he became the rector of the parish. In 1802 appeared his *Monographia Apium Angliæ* (2 vols., Ipswich), the first scientific English work of its class. Several years later he joined Mr. Spence of Hull in a project for preparing a popular treatise on entomology, the result of which was the publication in 1815 of the first volume of "Kirby and Spence's Introduction to Entomology;" the second volume appeared in 1817, and the third and fourth in 1826. In 1830 he produced a Bridge-water treatise on the "Habits and Instincts of Animals with reference to Natural Theology," and he subsequently wrote the description of insects in Sir John Richardson's *Fauna Boreali-Americana*, besides several minor works. His biography was written by the Rev. John Freeman (London, 1852).

**KIRCHER, Athanasius**, a German scholar, born near Fulda, Hesse-Cassel, May 2, 1602, died in Rome, Nov. 28, 1680. He was educated at the university of Würzburg, where he afterward taught philosophy and the oriental languages. After the invasion of Franconia by the Swedes in the thirty years' war he retired to France, and passed two years in the Jesuits' college at Avignon. He then went to Rome, where he was for eight years professor of mathematics. His most important works are: *Prodromus Coptus sive Ægyptiacus* (Rome, 1636); *Lingua Ægyptiaca Restituta* (1644); and *Latium* (Amsterdam, 1671), with valuable maps and plans. He was a voluminous writer on mathematical and physical science, and his *Mundus Subterraneus* (2 vols., 1664-'8) comprises all the geological knowledge of the day. He made many philosophical inventions, and collected a celebrated museum of instruments, models, natural objects, and antiquities, for the Jesuit college at Rome. This was described by Sepi (Amsterdam, 1679), and by Buonanni under the title *Museum Kircherianum* (fol., Rome, 1709; new ed. by Battara, 1773).

**KIRCHHEIM**, or **Kirchheim-unter-Teck**, a town of Württemberg, on the Lauter, and not far from the Teck, 18 m. S. W. of Ulm; pop. in 1871, 5,863. It has a royal castle, a large hos-

pital, a house of refuge, iron works, and a sulphur spring. Linen, cotton goods, musical instruments, and other articles are manufactured; and there are important wool, sheep, and cattle markets.

**KIRCHHOFF, Gustav Robert**, a German physicist, born in Königsberg, March 12, 1824. In 1845 he published an essay on the passage of the electric current through planes. He graduated at Königsberg in 1846, and in 1848 began lecturing in Berlin on mathematical physics, and published several elaborate articles on electrology. In 1850 he was appointed lecturer on experimental physics at Breslau, and in 1854 professor of natural philosophy at Heidelberg, which chair he still occupies (1874). Between 1850 and 1858 he published numerous articles on magnetism, electricity, heat, and the tension of vapors; and in 1859 he made the discovery which has rendered him famous, the cause of Fraunhofer's lines in the solar spectrum. Euler a century ago, and in later years Talbot, Miller, Wheatstone, Foucault, Angström, Balfour Stewart, and Tyndall, had all been very close upon the discovery; but Kirchhoff (in Poggendorff's *Annalen*, vol. cix., p. 275), was the first to propound and demonstrate the law: "The relation between the power of emission and the power of absorption of one and the same class of rays is the same for all bodies at the same temperature." This was the basis of his invention in 1860, in conjunction with R. W. Bunsen, of the new method of qualitative chemical analysis called spectrum analysis. (See SPECTRUM ANALYSIS.) He published *Untersuchungen über das Sonnenspectrum und die Spectren der chemischen Elemente*, which contains his views of the physical constitution of the sun (Berlin, 1861; 3d ed., 1866); and with Bunsen, *Chemische Analyse durch Spectralbeobachtung* (Vienna, 1861). He and Bunsen together, by means of spectrum analysis, discovered two new metals, cesium and rubidium. In 1870 Kirchhoff became a foreign member of the Berlin academy of sciences; and subsequently the Prussian order *pour le mérite*, the highest honor of its kind in Germany, was conferred upon him. Recently he has begun the publication of what is designed to be an elaborate work on mathematical physics. The first part bears the title, *Vorlesungen über analytische Mechanik, mit Einschluss der Hydrodynamik und der Theorie der Elastizität fester Körper* (Leipsic, 1874).

**KIRCHHOFF, Johann Wilhelm Adolf**, a German philologist, born in Berlin, Jan. 6, 1826. He is a son of the historical painter Johann Jakob Kirchhoff. After teaching in a gymnasium, he became in 1865 a professor in the university of Berlin, and in 1867 succeeded Böckh as a director of the philological seminary. His works include editions of Plotinus (2 vols., Leipsic, 1854) and Euripides (2 vols., 1855, and 3 vols., 1867-'8), *Die homerische Odyssee und ihre Entstehung* (1859), and *Die Composition der Odyssee* (1869). He is a high

authority on the old Italic languages and on palæography. For the academy of sciences he edited part of the *Corpus Inscriptionum Græcarum* (1859), containing the Christian inscriptions, and *Corpus Inscriptionum Atticarum* (1872 *et seq.*).

**KIRGHIZ**, Kirghises, or Kirghiz-Kazaks, a nomadic people of Asiatic Russia, occupying a region called the Kirghiz steppes, which extends from the Caspian sea to the Russian-Chinese frontier at the Altai mountains, and from the sea of Aral to the Tobol and the Ir-tish. Their former abodes were further east. Since the recent political reconstruction of Siberia and central Asia there are three divisions of Kirghiz steppes: those of Orenburg, of West Siberia, and of Turkistan. The Russian government estimates all the Kirghiz at 1,286,000, occupying an area of 856,000 sq. m. The Kirghiz are divided into the Little, Great, and Middle hordes, which are politically independent of each other. They are subject to Russia, and the dignity of khan has been disallowed among them as a title of authority. They belong to the Turco-Tartaric race, but their physiognomy betrays a large admixture of more eastern blood. They resemble the Uzbecks, speak the same language, and profess to be related to them. Their stature is under the middle size, their countenance disagreeable, their eyes deep set and elongated, and their cheeks large and bloated; the women are, however, rather pretty and delicately formed. The men, though not muscular, are hardy and vigorous. Their chief occupation is tending sheep, goats, horses, and camels. They have a few domestic manufactures, but on the whole are one of the most barbarous races of Asia, and the efforts of the Russian government to gather them into towns and teach them the arts of civilization have met with no success. A large share of the outdoor as well as domestic labor is left to the women. The dress of the men consists of one or more loose frocks, wide trousers, colored boots, a girdle, and a conical felt hat in summer or a furred cap in winter. That of the women is nearly the same. The more wealthy wear silks, sometimes finely embroidered. Their dwellings, called *yurts*, consist of huts made of willow trellis work covered with a kind of sheeting of wool and camels' hair. Mutton, horse flesh, tea, and sour mares' milk are the principal articles of diet. The Kirghiz were formerly the chief slave catchers of the steppes, and a brother sometimes sold his sisters into servitude in order to avoid the expense of their support. The slaves were sent to Khiva, Bokhara, and other Turkoman states; but recently the influence of Russia has caused the abolition of slavery in these states. The religion of the hordes is a corrupt form of Mohammedanism. There are kindred tribes in East Turkistan, sometimes designated as the eastern Kirghiz. — See Atkinson's "Oriental and Western Siberia." Nicholas Ilminski, professor at the university of Kazan, published in 1861, in

Kirghiz, a manual of the Russian language, and in 1862 the Kirghiz text of the legend of the popular hero Targun, and a grammar and dictionary in one volume, under the title of "Materials for the Study of Kirghiz."

**KIRK**, Edward Norris, an American clergyman, born in New York, Aug. 14, 1802, died in Boston, March 27, 1874. He graduated at the college of New Jersey in 1820, and studied law for 18 months, but afterward entered and graduated at the theological school in Princeton. He was for a time agent in the southern states for the American board of foreign missions, and in 1828 became pastor of a Presbyterian church organized for him in Albany, N. Y. In 1837 he resigned on account of ill health, and visited Europe, preaching in London, and for several months in Paris. Being appointed secretary of the foreign evangelical society, he returned to the United States in 1839, to present the claims of Roman Catholic countries as a field for missionary effort. In 1842 he became pastor of the Mount Vernon church in Boston, which was organized for him, and where he preached till 1871, when his failing health compelled the transfer of active labor to a colleague. In 1856 he visited Paris, at the request of the American and foreign Christian union, for the purpose of establishing American Protestant worship in that city. While assiduous in the duties of his own parish, he was a frequent and most acceptable preacher in other parishes, particularly in times of special religious interest. During his last years he became almost entirely blind; he was active, however, in ministerial meetings, and led an interesting discussion on revivals only four days before his death. He received the degree of D. D. from Amherst college. At the time of his death he was president of the American missionary association. Besides about 30 occasional sermons and addresses, he published two volumes of sermons and a volume of "Lectures on the Parables." He also wrote some short works which were published by the American tract society in Boston, and translated Gausson's *Théopneustie*, a treatise on the inspiration of the Scriptures.

**KIRK**, John Foster, an American author, born in Fredericton, New Brunswick, in 1824. He was educated in Nova Scotia, and took up his residence in the United States about 1842. In 1847 he became secretary to William H. Prescott, whom he continued to assist until the historian's death in 1859. In 1863 he published in London and Philadelphia the first two volumes of his "History of Charles the Bold," the third and concluding volume appearing in 1868. He has contributed several historical and other articles to leading periodicals, and since 1871 has been editor of "Lippincott's Magazine" in Philadelphia. He has prepared a new edition of Prescott's works, embodying emendations left by the author, with original notes.

**KIRKBRIDE**, Thomas S., an American physician, born near Morrisville, Bucks co., Pa.,

July 31, 1809. His ancestors were members of the society of Friends (to which he also belongs), and came to America with William Penn. He received the degree of M. D. from the university of Pennsylvania in March, 1832, and was appointed resident physician of the Friends' lunatic asylum at Frankford, Pa. A year later he was elected resident physician of the Pennsylvania hospital, in which post he continued two years. In October, 1840, he was elected superintendent of the Pennsylvania hospital for the insane, which was opened in January, 1841. He has published "Rules and Regulations of the Pennsylvania Hospital for the Insane" (1850), which has been a text book and guide in the regulations of new hospitals; "On the Construction, Organization, and General Management of Hospitals for the Insane," and "Appeal for the Insane" (1854). He has also been a frequent contributor to the "American Journal of Medical Sciences," and the "American Journal of Insanity." In 1853 he proposed the erection of a new hospital, and the separation of the sexes in two distinct buildings. To carry out his plan he raised \$355,000 in Philadelphia and vicinity; the new hospital was finished in 1859, and Dr. Kirkbride has since given his personal supervision to the female department.

**KIRKCALDY**, a parliamentary burgh and seaport of Fifeshire, Scotland, 13 m. N. of Edinburgh, on the N. shore of the frith of Forth; pop. in 1871, 12,422. It extends E. and W. along the shore for nearly 2 m. There are bleach fields, jute and linen factories, flour mills, breweries, distilleries, and machine shops. The trade of the port is quite large. The imports are principally from Germany and Egypt, and consist of flax, timber, and corn; the exports are linen, jute, yarn, herrings, and coal. Several free schools have been founded in the towns of this part of Fifeshire through the munificence of Mr. Robert Philp, a merchant of Kirkcaldy, who died in 1829, and left over £70,000 for this purpose.

**KIRKCUDBRIGHT**, a S. W. county of Scotland, bordering on Solway frith, which separates it from the English county of Cumberland; area, 954 sq. m.; pop. in 1871, 41,852. With the county of Wigtown, which adjoins it on the west, and part of Ayr and Lanark, it forms the district of Galloway. Most of the district is hilly, and the N. W. part is mountainous; there are also several high peaks in the south. The principal summits are Blacklarg in the north (2,890 ft. high), Cairnsmoor in the southwest (2,329), and Criffel in the southeast (1,831). The principal rivers are the Dee, Fleet, Ken, and Urr. Small lakes are numerous. About one third of the soil is capable of cultivation, and when properly manured is very fertile. Cattle of the famous Galloway breed are largely exported. The small Galloway horses were formerly reared here, but have been almost wholly replaced by a larger breed. The county is noted for

excellent honey. Kirkcudbright is commonly called a stewartry instead of a shire, and has an officer termed a steward, whose duties correspond to those of a sheriff in other counties.

—**KIRKCUDBRIGHT**, the capital, is a seaport on the Dee, 6 m. from its confluence with the Solway frith, and 25 m. S. W. of Dumfries; pop. in 1871, 2,470. It has few manufactures, but considerable trade in agricultural produce.

**KIRKE**, Sir David, an English colonial adventurer, born in Dieppe, France, in 1596, died at Ferryland, Newfoundland, in the winter of 1655-'6. He was the oldest son of Gervase Kirke, an English merchant who carried on business for many years at Dieppe, and married there. David went into business as a wine merchant at Bordeaux and Cognac, but during the Huguenot troubles retired to England. His father became interested in Sir William Alexander's American projects, and sent out three vessels under royal letters of marque in 1627 to break up the French settlements in Canada and Nova Scotia. David Kirke, accompanied by his two brothers, commanded the expedition; he ran up to Tadoussac, and sent parties to burn the houses and kill the cattle at Cape Tourmente, and also summoned Champlain to surrender Quebec. Hearing of the approach of a French squadron under De Roquemont, he prepared to meet it. De Roquemont engaged him near Gaspé, July 18, 1628, but was soon compelled to strike. Kirke thus captured all the stores, ammunition, and arms intended for Quebec. He sailed again with his brothers from England in March, 1629, and in July Champlain was compelled to surrender. Nova Scotia, too, was reduced. These conquests were given up by England in 1632; but Kirke was knighted by Charles I. in 1633, and with others obtained a grant of Newfoundland. He devoted himself to its colonization, and held it till dispossessed by Cromwell, having been governor for nearly 20 years. He recovered part of his property by bribing Cromwell's son-in-law Claypole, and returned to Ferryland in 1653.

**KIRKES**, William Senhouse, an English physician, born about 1820, died in December, 1864. He was physician to St. Bartholomew's hospital in London, and lecturer to the medical college attached to that institution. He is best known as the author of a "Handbook of Physiology," first published in 1848, which passed through several editions in England and was republished in the United States. Among his other most important contributions to medical literature were a series of papers on the "Detachment of Fibrinous Deposits from the Interior of the Heart." His name is in this way closely connected with the subject of embolism, one of the most remarkable and important features of recent pathological science. (See BRAIN, DISEASES OF THE, vol. iii., p. 198.)

**KIRKLAND**, Caroline Matilda (STANSBURY), an American authoress, born in New York in January, 1801, died there, April 6, 1864. She

was married to Prof. William Kirkland of Hamilton college, who established a seminary in Goshen, on Seneca lake, and afterward emigrated with his family to Michigan, whence after a residence of 2½ years they removed in 1843 to New York. Her works include "A New Home: Who'll follow?" (Boston, 1839); "Forest Life" (1842); "Western Clearings" (1846); "Holidays Abroad, or Europe from the West" (2 vols., 1849); "The Evening Book, or Fireside Talk on Morals and Manners, with Sketches of Western Life" (1852); "A Book for the Home Circle" (1853); the letterpress to "The Book of Home Beauty;" and "Personal Memoirs of George Washington" (1858).

**KIRKLAND, John Thornton**, an American clergyman, born at Little Falls, N. Y., in 1770, died in Boston, April 26, 1840. He was the son of Samuel Kirkland, a famous missionary among the Indians, graduated at Harvard college in 1789, and was ordained pastor of the Congregational church in Summer street, Boston, in 1794. He was elected president of Harvard college in 1810, and held this office till 1823, when he was enfeebled by a severe attack of paralysis. Although a writer of great and acknowledged excellence, he could never be induced to undertake an extensive work, but published a number of occasional pamphlets and some biographies. Of these, his life of Fisher Ames (1809) was perhaps the most valuable. He exerted a very great influence during his life, by the force of his intellect and character. He impressed himself strongly upon all with whom he came in contact; and during his presidency the college flourished, both in its internal condition and in its external relations.

**KIRKWOOD, Daniel**, an American mathematician, born in Harford co., Md., Sept. 27, 1814. He was mathematical tutor in the academy of York co., Pa., from 1838 to 1843, when he became principal of the Lancaster high school, and resigned in 1848 to accept a position in the Pottsville academy. In 1849 he communicated to the American philosophical society, at Philadelphia, and to the American association for the advancement of science, at Cambridge, Mass., his then recently discovered analogy between the periods of rotation of the primary planets. In 1851 he became professor of mathematics, and in 1854 president, of Delaware college, resigning in 1856 to take the chair of mathematics in Indiana university at Bloomington. He has been an earnest advocate of the nebular hypothesis. His paper in the monthly notices of the royal astronomical society, vol. xxix., "On the Nebular Hypothesis, and the Approximate Commensurability of the Planetary Periods," applies the theory of Laplace to explain the existence of gaps and chasms in the zone of minor planets between Mars and Jupiter, and assigns a physical cause for the hiatus in Saturn's ring. Noticing this paper, Mr. R. A. Proctor says of Prof. Kirkwood's researches: "I believe they will inaugurate new and im-

portant processes of thought, by means of which the noble and hitherto intractable problems connected with the formation of the solar system may be found capable of solution." Prof. Kirkwood has also published "Comets and Meteors: their Phenomena in all Ages, and their Mutual Relations, and the Theory of their Origin" (Philadelphia, 1873). He received the degree of LL.D. from the university of Pennsylvania in 1852.

**KIRSCHWASSER** (Ger. *Kirsche*, cherry, and *Wasser*, water), an alcoholic liquor distilled from the fermented mash of small and sweet black cherries. In the ordinary rude way of preparing it, it is a rank liquor containing hydrocyanic acid derived from the cherry stones. A superior kind is made in the Black Forest from fruit more carefully selected and treated.

**KIRWAN, Richard**, an Irish chemist, born in county Galway about the middle of the 18th century, died in Dublin in 1812. He was educated at Trinity college, and at the Jesuits' college of St. Omer in France. In 1779 he went to England, and settled near London, where he devoted himself to the study of chemistry and geology. Having been admitted a member of the royal society, he read several valuable papers before that body, for which the Copley medal was awarded to him in 1782. Returning to Ireland in 1789, he was chosen president of the royal Irish academy, and of the Dublin society, and afterward became a member of the principal learned societies of Europe. He was a frequent contributor to the "Transactions" of the various scientific societies of Dublin and London. His most important works are "An Essay on Phlogiston and the Composition of Acids," in which he labors to reconcile the chemistry of the alchemists with that of modern times; "Elements of Mineralogy;" and "Essay on the Analysis of Mineral Waters." Lavoisier translated the first, and appended a refutation of the theory.

**KISFALUDY. I. Károly**, a Hungarian dramatist, born at Tété, in the county of Raab, Feb. 6, 1788, died in Pesth, Nov. 21, 1830. At an early age he entered the Austrian army, served in Italy and in the campaign of 1809 in Germany, and acquired great popularity by a series of national dramas and comedies, such as: *A tatárok Magyarországon* ("The Tartars in Hungary"), *Zách Klára* ("Clara Zách"), *A kérok* ("The Suitors"), *A pártütök* ("The Rebels"), and an excellent comedy, *Mátyás deák* ("The Student Matthias"). **II. Sándor**, elder brother of the preceding, born at Sümeg, Sept. 22, 1772, died there, Oct. 28, 1844. He studied at Raab and Presburg, entered the Austrian army in 1793, served in the wars of Italy and in the campaign of Switzerland, and fought in the battle of Zürich (1799). In 1800 he returned to Hungary, and for about 25 years continued to write poetry, including *Himfy szerelmei* ("The Love of Himfy"), and *Regék* ("Ballads"). Some of his poems have been translated into English by John Bowring.

—The complete works of both brothers have been edited by Schedel (Toldy).

**KISHENEV**, a town of European Russia, capital of the government of Bessarabia, on the Byk, a tributary of the Dniester, 86 m. N. W. of Odessa; pop. in 1867, 103,998. The inhabitants are a motley mixture of Jews, Russians, Roumans, Poles, Greeks, Bulgarians, Armenians, and others. The town occupies a wide extent, and is pleasantly situated. It is the seat of a Greek archbishop, and contains a number of churches, an ecclesiastical college, gymnasium, and library, and manufactories of wool, leather, and soap.

**KISS**, August, a German sculptor, born near Pless, Prussian Silesia, Oct. 11, 1802, died March 24, 1865. He received his early education in Gleiwitz, and at the age of 20 became a pupil of Rauch at the academy of Berlin. His earliest productions were bass-reliefs for churches and other public buildings, groups of nymphs and tritons for fountains or gardens, and the ordinary classical subjects, executed partly from Rauch's designs and partly from his own. The "Amazon and the Tiger," finished in 1839, first brought him into notice. His colossal group of "St. George and the Dragon," exhibited in the French exposition of 1855, was severely criticised. Among his other works are a statue of Frederick the Great at Breslau, two of Frederick William III., "St. Michael overthrowing the Dragon," and a colossal tiger's head in bronze killing a serpent.

**KISSINGEN**, a watering place of Bavaria, in the district of Lower Franconia, on the Saale, 32 m. N. by E. of Würzburg; pop. in 1871, 2,591. It is walled, and has very extensive baths with five mineral springs. Of these the Pandur spring, discovered in the 16th century, has a temperature of 50°, and is chiefly used for bathing; the Ragoeczy, discovered in 1737, has 52°, and is a drinking water; the Max has 50°; the Theresa the same; and the Soelensprudel, 68°, is chiefly used for bathing. The first two springs contain iron, and the others salt. There were 11,000 visitors in 1871. The waters are exported to a considerable extent. A little N. of the town are rich saline springs, from which 1,500 tons of salt are annually made. There is an artesian well, 2,000 ft. deep, which throws up, by the action of a subjacent stratum of carbonic acid gas, a column of water 5 inches in diameter, 76 ft. above the surface, and discharges 96 to 100 cubic ft. per minute. This water is forced down a tube sunk into a stratum of rock salt, and is again thrown 80 ft. above the surface into a reservoir, whence it feeds the salt pans in the boiling house, and yields pure white crystalline salt. The Prussians here gained a victory over the Bavarians, July 10, 1866. An attempt on the life of Prince Bismarck was made here, July 13, 1874, by Kullmann, a cooper.

**KISTNAH**, or Krishna, a large river of S. India, which rises in the Western Ghats, at Mahabulishwar, about 40 m. from the Malabar coast,

and after a S. E. course of about 800 m. discharges its waters by many mouths into the bay of Bengal, near Masulipatam. Its principal tributaries are the Wurna, Malpurba, Gutpurba, Beemah, Toongabudra, and Mussy. It is subject to two periodical risings annually. The first and greatest is caused by the heavy rains of the S. W. monsoon, the other by those of the N. E. monsoon. The Kistnah is connected with the Godavery by a canal 90 m. long, and irrigates the adjacent country by numerous artificial channels. At Boburlanka, in lat. 16° 5' N., lon. 80° 56' E., it divides into two main branches, which diverge from each other in their progress to the sea, and form an extensive delta, intersected by less considerable branches. On account of the rapid declivity and rocky nature of its waterway, the Kistnah can hardly be anywhere navigated even by small craft; but in the lower part it has been made navigable by the government. In its upper course it is usually crossed in large circular bamboo baskets covered with hides. It is richer in gems than any other Indian river.

**KIT CAT CLUB**, a convivial association established in London about the time of the revolution. As its leading members were mostly whigs, it quickly assumed a political character, and came to be regarded as the headquarters of the friends of the Hanoverian succession. It was held in Shire lane, at the house of Christopher (alias Kit) Cat, who supplied its votaries with mutton pies. Addison, Steele, Walpole, Sir Godfrey Kneller, and Marlborough belonged to it. The club was dissolved about 1720. The memoirs of the celebrated members of the Kit Cat club, illustrated with 48 portraits three quarters in length (whence the term Kit Cat portraits) from the original paintings by Sir G. Kneller, were published in London in 1821.

**KITCHNER**, William, an English physician and author, born in London about 1775, died there in 1827. He was educated at Eton. His literary works are of a very miscellaneous character. They embrace treatises on gastronomy, health, the eye, telescopes, and music, together with a collection of the "Loyal and National Songs of England." The "Cook's Oracle" is perhaps the most important of his productions.

**KITE**, the common name of many birds of prey belonging to the subfamily *milvinae*, characterized by moderate size, slender figure, short and weak bill with hooked and acute tip and sinuated margins, nostrils basal and lateral, wings long and pointed, tail long, tarsi slender and rather short, toes moderate, broad, and padded. Many of the genera need only be mentioned here; among them, according to Gray, are *baza* (Hodgs.), from India, its archipelago, and Australia; *aviceida* (Swains.), from W. Africa; *pernis* (Cuv.), including the old world honey buzzards (see BZZARD), of which *P. apivorus* (Selb.) is a well known European representative; *cyindis* (Cuv.) and *gamponyz* (Vigors), from tropical America.—Among the

American kites belongs the genus *nauclerus* (Vig.), with long pointed wings and deeply forked tail. The swallow-tailed kite (*N. furcatus*, Linn.) is about 2 ft. long, with an extent of wings of 4½ ft.; the back, wings, and tail are black, with a metallic lustre, purple on the wing coverts; head, neck, under wing coverts, base of secondaries, and lower parts white; tarsi and toes greenish blue; bill horn color. This species is found in the southern Atlantic states, and in the interior from Texas to Wisconsin; it is accidental in Europe. The flight of this bird is exceedingly graceful and rapid. Flocks of 15 or 20 are often seen; they arrive in the gulf states early in April, probably from Mexico and Central America, and disappear in September; they are shy, on the wing during most of the day, and at night resting on the highest trees; they feed during flight, and in calm weather soar to an immense height in pursuit of large insects; the gait on the ground is very awkward. The nest resembles that of the crow, and is usually placed in the top of a tall tree; the eggs, four to six, are greenish white, with irregular brown blotches at the larger end.—In the genus *elanus* (Sav.), found in the warmer parts of the globe, belongs the white-tailed or black-shouldered kite (*E. leucurus*, Vieill.); the length is about 16 in. and the extent of wings about 3½ ft., in the female; the wings are long and pointed, but the tail is moderate and emarginated; the head, tail, and under parts are white; above light ashy, with an oblong black patch on the shoulder formed by the lesser wing coverts; inferior wing coverts white, with a smaller black patch; the middle tail feathers are light ashy; bill dark; tarsi and toes yellow. It is found in

Mississippi Kite (*Ictinia mississippiensis*).

the southern and western states, and in South America; rarely seen north of South Carolina on the Atlantic coast, it occurs considerably further north on the Pacific. It flies very high, and is not easily approached in its favorite marshy retreats; it feeds on small birds and

large insects, especially orthoptera, and is very bold in their pursuit. The Mississippi kite (*Ictinia mississippiensis*, Wilson), of the southern states, Texas, and New Mexico, a smaller species, approaches nearest to the true falcon. A species of the genus *rostrhamus* (Lesson), generally South American, has been found breeding in Florida; this is the black kite (*R. sociabilis*, Vieill.), remarkable for its slender and much hooked bill; it is about 16 in. long, of a black color, with base of tail and its under coverts white; the young birds are more brownish and yellow; it preys principally on reptiles, and perches on the loftiest trees.—Of the kites of the old world, the best known is the common *milvus regalis* (Briss.) of Europe, of a reddish brown color above, with blackish longitudinal streaks, and the lower parts light brownish red with narrower streaks; the female is about 26 in. long, with an extent of wings of 5½ ft. The flight is remarkably powerful and elegant; the food consists of small quadrupeds, birds, reptiles, insects, carrion, and even fish. It is found in Europe, N. Africa, and W. Asia, in almost all regions, both wild and inhabited; it sometimes steals a young chicken when the hen is off her guard, but dares not make a direct attack in her presence.

**KITSAP**, a N. W. county of Washington territory; area, 400 sq. m.; pop. in 1870, 866. It is a peninsula, having Hood's canal on the west and Admiralty inlet on the east and north. It includes Bainbridge and Blaine islands. The production of lumber is the principal industry. In 1870 there were three planing mills, with an annual production valued at \$588,000, and three saw mills, producing \$520,000 worth of lumber. Capital, Port Madison.

**KITTANNING**, a borough and the capital of Armstrong co., Pennsylvania, situated on a broad alluvial plain on the E. bank of the Alleghany river, and on the Alleghany Valley railroad, 38 m. N. E. of Pittsburgh; pop. in 1870, 1,889. In the hills skirting and opposite the borough are found, nearly horizontal, one stratum of cannel and five of bituminous coal, and two each of iron ore and limestone; also pure fire clay and good building stone. It has gas and water works, and contains three iron foundries, a rolling mill, two flouring mills, a planing mill, a brewery, a tannery, two banks, two schools, three weekly newspapers, and eight churches.

**KITTATINNY**, or *Blue Mountains*, a chain which commences in Ulster co., N. Y., and crossing the N. W. part of New Jersey passes into Pennsylvania, where it forms one of the principal mountain ridges of the state. It is broken by the Delaware river at the Water Gap, by the Lehigh at Wind Gap, by the Schuylkill above Hamburg, and by the Susquehanna about 5 m. above Harrisburg. Between it and the N. branch of the Susquehanna, a distance of about 35 m., is the great anthracite region. Passing out of Pennsylvania, its course is less marked as it approaches the South mountains and the

Potomac, but it may be traced into Alabama, a total length of more than 800 m. Its elevation varies from 800 to 2,500 ft. above the sea.

**KITTERY**, a town of York co., Maine, on the Portland, Saco, and Portsmouth railroad, 42 m. S. W. of Portland, and at the mouth of the Piscataqua river, opposite Portsmouth, N. H., with which it is connected by a bridge and by ferry; pop. in 1870, 3,333. It forms the S. W. extremity of the state, and is chiefly noted as the seat of a United States navy yard. This establishment is situated on an island in the river within the limits of the town, and contains extensive ship houses, machine shops, rigging lofts, wharves, barracks, and a dry dock which cost \$800,000. The town is the birthplace of Sir William Pepperell. It was settled in 1623, and incorporated in 1647.

**KITTIWAKE**. See GULL.

**KITTO, John**, an English Biblical scholar, born in Plymouth, Dec. 4, 1804, died in Cannstatt, Germany, Nov. 25, 1854. He was the son of a mason, and when about 12 years old was rendered incurably deaf by a fall from the roof of a house. Poverty compelled him to enter the workhouse of Plymouth. He was apprenticed to a shoemaker, who treated him so cruelly that his indentures were cancelled and he returned to the workhouse. His love of study procured him admission to a college in Islington, and he soon after published by subscription a small volume of miscellaneous writings. Next he went to Exeter to learn the profession of a dentist; and thence to London, where he was employed in the printing office of the church missionary society. Two years later he went to the society's establishment at Malta, and subsequently he visited Bagdad as a private tutor. There he resided three years, and acquired an intimate acquaintance with oriental life. Soon after returning to London Charles Knight engaged him first as assistant in preparing serials for the "Library of Useful Knowledge," and afterward in the compilation of other works. Having been seized with paralysis, he retired in 1854 to Cannstatt. In 1844 he received the degree of D. D. from the university of Giessen; and the British government granted him in 1850 an annuity of £100. His principal works are: the "Pictorial Bible" (1835-'8; 2d ed. enlarged, 4 vols. royal 8vo, 1847-'9); "Uncle Oliver's Travels" (2 vols. 12mo, 1838); "Pictorial History of Palestine" (2 vols. royal 8vo, 1839-'40); "Cyclopædia of Biblical Literature" (2 vols. 8vo, 1845-'50); "The Lost Senses: Deafness and Blindness" (1845); "Physical Geography of the Holy Land" (2 vols. 18mo, 1848); "Daily Bible Illustrations" (8 vols., 1849-'53). In 1848 he established the "Journal of Sacred Literature," which he edited till 1853. His memoirs have been written by J. E. Ryland (Edinburgh, 1856).

**KITTLITZ, F. H. von**, baron, a German naturalist, born in 1798, died in Mentz, April 10, 1874. He was an officer in the Prussian army,

and a nephew of the Russian field marshal Diebitsch, and made with the Russian captain Lütke a circumnavigation of the globe (1826-'9). He was also a painter and engraver, and published ornithological and other essays, illustrated by himself. In 1870, though then in his 72d year, he took charge of a military hospital. His works include *Vierundzwanzig Vegetationsansichten von den Küsten und Inseln des Stillen Oceans* (Wiesbaden, 1850-'52; new ed., Berlin, 1862 *et seq.*); *Denkwürdigkeiten einer Reise nach dem russischen Amerika, nach Mikronesien und durch Kamtschatka* (2 vols., Gotha, 1858); and *Psychologische Grundlage für eine neue Philosophie der Kunst* (Berlin, 1863).

**KIUKIANG**. See KEWKIANG.

**KIUSHIU, Kiusiu, or Kimo**, a large island of Japan, separated on the north from the main island by a strait  $1\frac{1}{2}$  m. wide, and N. E. from Shikoku or Sikok by a channel 9 m. wide; length 210 m., greatest width about 150 m.; area, about 15,000 sq. m. It is surrounded by inaccessible rocks and shallows, dangerous to navigation, and is traversed by many mountains, chiefly active volcanoes liable to formidable eruptions; one in 1826 caused great loss of life and property. The E. coast is sterile, but most other parts are fertile and well cultivated, owing to the abundance of rivers, the principal of which is the Kusnayara. Cotton cloth, silk goods, and paper are manufactured. Capital, Nagasaki.

**KIWI-KIWI**. See APTERYX.

**KLADNO**, a town of Bohemia, 13 m. N. N. W. of Prague, with which it is connected by railway; pop. in 1870, 11,199. It has a castle and several iron works. In the neighborhood are important coal and iron mines.

**KLAGENFURTH**, a town of Austria, capital of the duchy of Carinthia, 40 m. N. N. W. of Laybach; pop. in 1870, 15,200. It is the seat of the bishop of Gurk, and has a theological faculty, an episcopal seminary, a gymnasium, a *Realschule*, a deaf and dumb institution, a society of natural history, which has founded a national museum, and a historical society. It has manufactories of woollens, silks, and muslins. It is supposed to occupy nearly the site of the Roman Tiburnia, but it first became a place of interest and importance early in the 16th century, when it was fortified by the emperor Maximilian I. Görgey, after his surrender, was for many years confined at Klagenfurth.

**KLAMATH**, a N. W. county of California, bordering on the Pacific, bounded N. by Klamath river, which also intersects it, and traversed by Trinity river; area, about 2,000 sq. m.; pop. in 1870, 1,686, of whom 542 were Chinese. The surface is mostly mountainous, and in some places is covered with dense forests of redwood, cedar, spruce, and fir. The valleys are fertile, and the hilly districts afford good pasturage. Gold mining is prosecuted to a large extent near Klamath, Trinity, and Salmon rivers, at Gold Bluff, and in the vicinity of the beach. The Klamath Indian reserve,

25,000 acres in extent, is situated partly in this and partly in Del Norte co. The chief productions in 1870 were 2,360 bushels of wheat, 2,375 of oats, 9,548 of potatoes, and 693 tons of hay. There were 284 horses, 368 mules and asses, 372 milch cows, 1,587 other cattle, and 1,057 sheep; 2 saw mills, and 2 quartz mills. Capital, Orleans Bar.

**KLAMATH**, a river of California. It rises in Lower Klamath lake in the S. part of Oregon, and flows W. and S. across the California frontier. Its course thence is W. S. W., and afterward S. W., until it is joined by Trinity river on its left bank, when it makes a sharp bend and flows N. N. W. to the Pacific, about lat. 41° 30' N. There is a bar at its mouth which can be crossed at high water by ships of the line, and at low water by small boats only. The river itself is navigable by small steamers for about 40 m. Its waters abound in salmon and other fish, and there are valuable gold diggings on its banks. Its length is about 250 m. The town of Klamath is situated on its right bank, a few miles above its mouth.

**KLAMATHS**, the comprehensive name given to two or three distinct tribes on the Klamath river, living partly in Oregon and partly in California. They seem to have had no recognized tribal name. Those toward the mouth of the river and on the coast were called Euroc or Pohlik, meaning down; those on the upper river were termed Cahroc or Pehtsik. The Quoratem, considered by some as Eurocs, lay in the middle, from Bluff to Clear creek. Above the Cahrocs were the Moadocs or Modocs ("head of the river"), not usually included under the term Klamath. These tribes differed in language and type. The Cahrocs are said to be the finest California Indians, lively, enterprising, and energetic, cleanly in their persons, and great bathers. The Eurocs were darker and inferior. These tribes lived mainly by salmon and other fisheries, and on roots, acorns, &c. The men wear a buckskin girdle, the women a petticoat of the same material. Their houses, 20 ft. square, consisted of a kind of flagged cellar, with a rim around it, beyond which rose the redwood boards forming the sides. A pitched redwood roof covered it. There were no chiefs of the tribes, but only of each village or hamlet. The women tattooed the chin. For money they used the scalp of the red woodpecker or allcochick shells. The influx of whites led to acts of violence, and some of their villages were burned in 1851; but a treaty was made in October of that year. They then had about 18 villages, and numbered about 3,000. An attempt was early made to put them on a reservation, but they declined in numbers. Failure of the crops which they attempted to raise disheartened them. By a treaty of Oct. 15, 1864, the Klamaths and Modocs ceded all the lands from the Cascade mountains, reserving a small tract on Klamath lake, to which they were to remove after the ratification of the treaty, the United States to

pay \$80,000 in 15 years, as well as a large sum for advances, subsistence, &c. This reservation embraces 1,200 sq. m., much of it mountainous, and only a small part fit for cultivation. The Klamaths did not like the introduction of the Modocs into what had been their territory, and this eventually led to the Modoc war. The Klamaths have adapted themselves to their new position, cultivate some ground, have many horses and some cattle, but have become lumberers, turning out in 1873 200,000 ft. of sawed logs. Their district was assigned to the Methodist Episcopal church, but down to 1874 there was no school, church, or missionary. The tribe is fast vanishing, the population being returned in 1873 as only 572, a loss of more than three fourths in 25 years.

**KLAPKA, György**, a Hungarian soldier, born in Temesvár, April 7, 1820. He was educated in the school of artillery in Vienna, entered the noble life guards of the emperor, and in 1847 was appointed officer in a border regiment. In 1848 he offered his services to the new government of his country, and at the beginning of 1849 he was placed at the head of the army of the north. He gained decisive advantages over the Austrians under Schlick in the engagements of Tarczal (Jan. 22), Keresztur-on-the-Bodrog (23), and Tokaj (31), and commanded the right wing of the Hungarian army at Kápolna (Feb. 26, 27). He was promoted to the rank of general, and subsequently took part, under Görgey, in the five principal battles of the April campaign (at Bieske, Izsaszeg, Waitzen, Nagy-Sarló, and Acs), all of which ended in the defeat of the Austrians. His sortie out of the fortress of Comorn, Aug. 3, was one of the most signal deeds of the revolutionary war, and almost annihilated the Austrian army of observation. When the news from the Theiss suddenly destroyed all hope of further advantages, he retired to Comorn and surrendered on Oct. 4. Leaving Hungary, he lived for some time in Hamburg, London, Paris, and Switzerland. On the outbreak of the war against Russia he went to Constantinople, but failed to obtain an appointment. He became a citizen of Geneva in 1855. During the wars of 1859 and 1866 he entered into communication with the enemies of Austria, organizing Hungarian legions against her, and after the battle of Sadowa even entered Hungary; but the attempts failed. After the reconstruction in 1867, he returned to Hungary, and took part in the reorganization of the military forces of the country. In 1873 he was employed by the Porte in reorganizing the Turkish army, and in January, 1874, he accompanied Duke William of Württemberg in a journey to Egypt. He is the author of "Memoirs of the War of Independence in Hungary" (Leipsic, 1850; English translation, 2 vols., London, 1850); a history of "The National War in Hungary and Transylvania" (2 vols., Leipsic, 1851); and of "The War in the East" (Geneva, 1855; English ed., London, 1855).

**KLAPROTH.** I. **Martin Heinrich**, a German chemist, born at Wernigerode, Dec. 1, 1743, died in Berlin, Jan. 1, 1817. After being engaged for some years in Berlin as a practical chemist, he became an apothecary in 1780, and in 1787 was appointed professor of chemistry in the school of artillery. He was among the first who labored industriously in the classification of minerals by means of scientific analysis. He is the discoverer of zirconium, titanium, uranium, and tellurium. He first proved that potassium was found in volcanic products and in white garnets, and made known molybdate of lead and sulphate of strontium. II. **Heinrich Julius von**, a German traveller and orientalist, son of the preceding, born in Berlin, Oct. 11, 1783, died in Paris in August, 1835. Until the age of 15 he applied himself to chemistry and natural science, and from that time to oriental languages. After two years spent at the university of Halle, he went in 1802 to Dresden, where he devoted eight months to the oriental MSS. of its library. Here he began the publication of the *Asiatisches Magazin*. The Russian government sent him in 1805 with an embassy to Peking; but being recalled before crossing the frontier, he remained six months at Irkutsk and studied several Asiatic tongues. From this place he explored alone, in 1806, a wide range of the northern Chinese frontier. He returned to St. Petersburg in 1807, and was sent on a mission to the then almost unknown mountain regions of the Caucasus. The results of his researches were so little favorable to the hope that Russia could readily acquire dominion over the country, that it was with the greatest difficulty that Klaproth obtained in 1810 permission to publish an account of his expedition. The annoyances which he experienced on this occasion determined him to quit Russia, and two years later (1812) he obtained leave to depart. In 1814 he visited Italy, and finally went with the allied army to Paris, where he passed the remainder of his life. He remained for a long time the chief authority on various branches of Asiatic geography and philology; but of late the itineraries of his travels in central Asia have been subjected to most serious accusations, and Sir H. C. Rawlinson, in a "Monograph on the Oxus" read before the royal geographical society of London in 1872, declares the exposure of imposture in regard to three incriminated memoirs to have been fully established by Lord Strangford. His publications are: *Reise in den Kaukasus*, &c. (2 vols., Berlin, 1812-'14); *Supplément au Dictionnaire chinois-latin du Père Basile de Glemona* (Paris, 1819); *Asia Polyglotta ou classification des peuples de l'Asie*, &c. (1823-'9); *Tableaux historiques de l'Asie*, &c. (1824-'6); *Mémoires relatifs à l'Asie* (3 vols., 1824-'8); *Tableau historique, &c., du Caucase* (1827); *Vocabulaire latin, persan et coréen* (1828); *Examen critique des travaux de M. Champollion jeune* (1832). He left in MS. an extensive work, *Nouveau*

*Mithridate, ou Classification systématique de toutes les langues connues*, which contains a grammatical sketch of most known languages, with a polyglot vocabulary of the five grand divisions of the world. An English translation by F. Shoberl of his "Travels in the Caucasus and Georgia, performed in 1807-'8," appeared in London in 1814.

**KLAUSENBURG** (Hun. *Kolosvár*), a town of Transylvania, capital of the county of the same name, and before 1848 of the whole country, on the Szamos, near its source, 225 m. E. by S. of Pesth, with which it is connected by railway; pop. in 1870, 26,382, chiefly Magyars. It has a fortified but partly decayed castle, and consists of two towns, the old and new, and six suburbs. It has Roman Catholic, Greek Catholic, and Protestant churches, a Roman Catholic gymnasium and seminary, a Protestant gymnasium, a Unitarian college, a Greek Catholic school, a Franciscan convent, two museums, a Hungarian theatre, and several benevolent institutions. Among the prominent buildings are several palaces belonging to the Transylvanian nobility. Klausenburg contains the only Unitarian college on the continent of Europe. In October, 1872, a university was opened here, the second in the lands of the Hungarian crown. It is an important centre of the trade between Transylvania and the neighboring counties of Hungary. It has also manufactories of porcelain. It was a colony of the Romans, belonging to the province of Dacia, and ancient coins and relics are frequently found in the vicinity. Matthias Corvinus was born here, and it has often figured in Hungarian history. During the Hungarian revolution it was taken by Gen. Bem, Dec. 25, 1848.

**KLAUSTHAL.** See CLAUSTHAL.

**KLÉBER, Jean Baptiste**, a French soldier, born in Strasburg in 1753 or 1754, assassinated in Cairo, Egypt, June 14, 1800. His father, a mason, died when he was a child, and he was educated by a country clergyman, his relative, who sent him to Paris to study architecture; but at the end of two years he returned to his native city. Two Bavarian gentlemen, whom he had protected from insult at a café, took him to Germany and placed him in the military school at Munich. After serving a few years as sub-lieutenant in the Austrian army, he resigned in 1783, returned to Alsace, and obtained the office of inspector of public buildings in the town of Belfort. In 1792 he enlisted as a private, soon became adjutant, distinguished himself during the siege of Metz, and was raised to the rank of adjutant general. He was put under arrest on the surrender of that city, and taken to Paris, where he fully vindicated his conduct and that of the whole garrison. He was then made a brigadier general, sent to La Vendée with the first division of the "army of Metz," fought heroically against the royalists, defeated them at Chollet, Oct. 17, 1793, and in concert with Marceau gained a victory at Savenay, Dec. 22. The in-

dignation he then manifested at the cruelties ordered by the commissioners of the convention caused him to be cashiered; but he was recalled in 1794, raised to the rank of general of division, and sent to the army of the north under Jourdan. He shared in the victory at Fleurus, June 26, 1794, and in the conquest of the Austrian Netherlands. In 1795 he blockaded Mentz, and directed several bold operations on the banks of the Rhine. In the following campaign he defeated the Austrian division under the prince of Würtemberg at the crossing of the Sieg, June 1, 1796, and nearly destroyed the same, three days later, at the battle of Altenkirchen. Nevertheless, he was dismissed, and retired to Chaillot, in the vicinity of Paris, where he devoted his leisure to preparing his *Mémoires*. In 1798 he joined Bonaparte in his expedition to Egypt, and received a wound on the head at the storming of Alexandria, where he remained in the capacity of governor. He accompanied the expedition to Syria, led the advance division, crossed the desert, took Gaza and Jaffa, won the victory of Mount Tabor, and on the raising of the siege of Acre covered the retreat of the exhausted army. When Bonaparte returned to France, he confided to Kléber the command of the army. The latter, who had never believed that Egypt could be held, listened to proposals of peace, and signed the treaty of El-Arish with Sir Sidney Smith, by which the French were allowed to leave Egypt with their arms and baggage. Kléber hastened to deliver some of the fortresses he held to the Turks, but was informed by Lord Keith that the treaty had not been ratified by the English government, and that the French army must lay down their arms and give themselves up as prisoners of war. On the reception of this news, Kléber attacked the Turkish army, won the brilliant victory of Heliopolis (March 20, 1800), retook Cairo and several other cities, and found himself again the undisputed master of Egypt. He now succeeded in conciliating Murad Bey, and was about to conclude peace with the Turks when he was murdered while walking in his garden at Cairo, by a young fanatic named Solyman. Kléber's remains were brought to Marseilles on the evacuation of Egypt by the French army, and placed in the château d'If. In 1818 they were removed to his native city, and a bronze statue was inaugurated over them, June 14, 1840.

**KLEIST, Ewald Christian von**, a German poet, born at Zehlin, Pomerania, March 3, 1715, died in Frankfurt-on-the-Oder, Aug. 24, 1759. After studying at Königsberg, he entered successively the Danish and the Prussian military service, was appointed lieutenant under Prince Henry by Frederick the Great, and after distinguishing himself for valor was fatally wounded in the battle of Kunersdorf. His greatest production is *Der Frühling* (1749). An edition of his complete works was published at Berlin in 1803 (2 vols.; 2d ed., 1825). A new edition, revised by Julian Schmidt, appeared in 1859.

**KLEIST, Heinrich von**, a German poet, born in Frankfurt-on-the-Oder, Oct. 10, 1776, died near Potsdam, Nov. 21, 1811. He made the campaign of the Rhine against France, and afterward studied law. After the battle of Jena he lamented in his poems the misfortunes of his country and his own imprisonment during the French occupation of Berlin. During the Austrian war against France in 1809, he hastened full of hope toward Vienna, but heard of the conclusion of peace on his way. Two years later he committed suicide in company with a friend, the wife of a Berlin merchant. He was one of the most able of the German romantic school of poets, and Gervinus calls him "the political Werther of his age."

**KLEMM, Friedrich Gustav**, a German historian, born in Chemnitz, Saxony, Nov. 12, 1802, died in Dresden, Aug. 26, 1869. He graduated at Jena in 1825, became in 1834 assistant, and in 1852 chief librarian at Dresden, and resigned in 1863. He pursued his historical studies with particular regard to the progress of civilization and humanity. His ethnographical, historical, and antiquarian collection was taken to Leipsic in 1871, for the central anthropological museum of that city. His principal works are: *Die Geschichte von Baiern* (3 vols., Dresden, 1828); *Allgemeine Culturgeschichte der Menschheit* (10 vols., Leipsic, 1843-'52); *Allgemeine Culturwissenschaft* (2 vols., 1854-'5); *Die Frauen* (6 vols., Dresden, 1854-'8); and *Vor fünfzig Jahren* (2 vols., Stuttgart, 1865).

**KLENGEL, Johann Christian**, a German painter, born near Dresden, May 5, 1751, died Dec. 19, 1824. The son of a peasant, he was learning bookbinding when he was provided with means to study at the academy of Dresden, and afterward in Italy. In 1802 he became professor in the Dresden academy, and was at the head of a school of landscape painters. He excelled in pictures of harvests, and many of his landscapes are remarkable for fine coloring, though mostly ultra-realistic imitations of nature. Many of his works found purchasers in Russia, and he made engravings from a great number of his paintings.

**KLENKE**. See KARSCH.

**KLENZE, Leo von**, a German architect, born in Hildesheim, Feb. 29, 1784, died in Munich, Jan. 27, 1864. He studied in Paris and Italy, became the friend and adviser of the crown prince of Bavaria, and after the elevation of the latter to the throne as Louis I. in 1825, was the architect of the Walhalla, as well as of the Glyptothek, Pinakothek, and other public buildings in Munich. He published a number of essays on art, including a treatise in which he endeavored to prove that the Grecian style of architecture is alone adapted to churches.

**KLIEFOTH, Theodor Friedrich Dethlef**, a German theologian, born at Körchow, Mecklenburg, Jan. 18, 1810. He has been for the last 25 years the principal ecclesiastical dignitary at Schwerin, and is a leader of the Old Lutherans. His principal works are: *Die ursprüngliche*

*Gottesdienstordnung in der deutschen Kirche lutherischen Bekenntnisses* (Rostock, 1847); *Liturgische Abhandlungen* (4 vols., 1854-'8); *Das Buch Ezechiel* (2 vols., Wismar, 1864-'5); and *Das Buch Daniel* (Schwerin, 1868).

**KLIKITAT**, a S. county of Washington territory, separated from Oregon by the Columbia river; area, 3,000 sq. m.; pop. in 1870, 329. The W. part is occupied by the Cascade range, and in the extreme N. W. is Mount Adams, 9,570 ft. high. In the S. E. is Kliki-tat prairie, watered by the Pattaha, a branch of the Yakima. In the W. part are the Kliki-tat, Womumchee, and White Salmon rivers. The best portion of the county is occupied by the reservation of the Yakima Indians, and it also contains the Simcoe agency. The chief productions in 1870 were 1,818 bushels of wheat, 2,635 of oats, 3,263 of barley, 1,373 of potatoes, and 455 tons of hay. There were 390 horses, 879 milch cows, 2,480 other cattle, and 753 swine. Capital, Rockland.

**KLIKITATS**, a roving tribe of Indians, north of the Columbia river and east of the Cascade mountains, composed of five bands, and numbering between 2,000 and 3,000. They are great gamblers for *hyaqua*, or shell money, and are restless and troublesome. They joined the Yakimas, with whom they are closely united, in the war of 1855, killed the agent Bolen, and took part in the surprise of Step-toe, but were defeated by Wright. They were soon after placed on White Salmon reservation, and are now on the Yakima reservation near Fort Simcoe, Washington territory, and are regarded as part of the Yakima nation.

**KLIN**, a town of European Russia, on the Sestra, in the government and 46 m. N. W. of Moscow; pop. in 1867, 6,580. It has an imperial palace, and was formerly the hereditary seat of the Romanoff family.

**KLINGER**, Friedrich Maximilian von, a German poet, born in Frankfort, Feb. 19, 1753, died in St. Petersburg, Feb. 25, 1831. He was educated at Giessen, began to write for the stage at Weimar and Leipsic, was sub-lieutenant in the volunteer corps of Walter in the war of the Bavarian succession, and went from Weimar to St. Petersburg in 1780, where under Catharine II. he became colonel, under Paul major general and director of the corps of cadets, and under Alexander in 1811 lieutenant general. He was in active service nearly 40 years. He was the most conspicuous representative of that excited period of German literature called the "storm and pressure period," which in fact took its name from his drama *Sturm und Drang* (1775). An edition of his select works was published at Stuttgart (12 vols., 1842).

**KLIJSPRINGER** (Dutch, cliff springer), a South African field antelope, *oreotragus saltatrix* (Bodd.). The male is about 3½ ft. long and 22 in. high at the shoulder; the head is short and broad, with a tapering nose and large bald muffle; the horns, which exist only in the males, are about 5 in. long, slender, vertical,

nearly parallel, acute, with a few rings at the base; the tear bag is arched and transverse; the ears are pointed, nearly as high as the horns; the eyes are full, lively, and dark hazel; the hoofs are small, square, and compressed, with large and blunt false hoofs; the tail very short. The body and limbs are robust; the hair is thick, wavy, erect, and quill-like, forming a natural pad to protect the body from bruises and falls in their dangerous retreats; the mammae are two. The color of the hair is grayish, brown at the end, with a short yellow tip, giving the general hue as a brown grizzled with yellow; the lower parts are whitish, and the edge of the ears and feet above the hoofs black; the color varies in intensity according to season. The females resemble the males, except in the absence of horns. These animals live in pairs. They possess the climbing propensities and sure-footedness of the goats, living among rocks inaccessible to

Klipspringer (*Oreotragus saltatrix*).

man and dogs, and springing like the chamois from one precipice to another with great agility and rarely failing accuracy. They used to be abundant in the colony of the Cape of Good Hope, but have been so hunted that they are now driven to the mountainous regions of the interior; their venison is considered the best in the country, and their elastic hair is in great demand for stuffing saddles.

**KLOPP**, Onno, a German historian, born in Leer, East Friesland, Oct. 9, 1822. He studied at Bonn, Berlin, and Göttingen, and from 1845 to 1858 was a teacher at the gymnasium of Osnabrück. He was employed in 1866 by King George of Hanover in various missions, and followed him into exile. His works include *Geschichte Ostfrieslands* (3 vols., Hanover, 1854-'8), *König Friedrich II. von Preussen und die deutsche Nation* (Schaffhausen, 1860), and *Tilly im Dreissigjährigen Kriege* (2 vols., Stuttgart, 1861). He edited, under

the auspices of the king, the works of Leibnitz relating to history and politics (5 vols., Hanover, 1864-'6), which is to be continued, though interrupted by the overthrow of the king of Hanover.

**KLOPSTOCK, Friedrich Gottlieb**, a German poet, born in Quedlinburg, July 2, 1724, died in Hamburg, March 14, 1803. He was born in a small house at the foot of the castle hill in the Schlossplatz, recognizable by the two pillars which support its porch. His father was a public functionary in comfortable circumstances and his mother a woman of great piety. In 1740 he entered the seminary of Schulpforte. At that early age he was already possessed by the ambition of producing a great epic. The stirring incidents of the life of Henry the Fowler captivated for a time his imagination, as shown by some odes written by him in honor of that prince; but after his attendance at the university of Jena (1745), religious enthusiasm led to the conception of his *Messias* ("Messiah"). In 1746 he went to Leipsic, then the resort of many literary men, who, after their secession from the pedantic school of Gottsched, had formed in 1740 a poetical union and established an independent literary journal published in Bremen. Klopstock, in his ode entitled *Wingolf*, distinguishes Gellert, Rabener, Hagedorn, Gleim, and many others of his literary associates of Leipsic, who as early as 1747 had recognized him as able to inaugurate a new era in German poetry. The first three cantos of his "Messiah" were published in 1748, in the Bremen *Literarische Zeitung*, and the poem was eventually regarded as equal to the epics of Dante and Milton, especially by the religious and female portion of the community. Gottsched, however, ridiculed what he called Klopstock's "seraphic spirit of fanaticism;" and his strictures on his dogmatism, his effeminate and morbid tenderness, and his religious sentimentality were afterward confirmed by Lessing, although in a milder and more dignified spirit. Foremost among his admirers was Bodmer of Zürich, the opponent of Gottsched, the translator of Milton, and the head of a school of poets and religionists. From 1748 to 1750 Klopstock was employed as a teacher in the family of his relative Weiss in Langensalza, where he met the sister of his friend Schmidt, whom he celebrates in his odes as his beloved Fanny, but who did not reciprocate his affection. In the summer of 1750 he went with his friend Sulzer to Zürich, which he left in the following year, in compliance with an invitation from the Danish prime minister Bernstorff, who offered him a pension of \$300, in order to enable him to devote himself exclusively to the completion of his epic. On his way to Copenhagen he fell in love with Margaretha (Meta) Moller, the daughter of a Hamburg merchant, whom he celebrates under the name of Cidli. In the Danish capital he was received with marked distinction, and introduced to the king, whom he accompanied on

a journey to Holstein, on which occasion he spent some time with Meta, who became his wife in 1754. She died in 1758, in her 31st year. The loveliness of her character is apparent in her correspondence with Richardson, the English novelist, with Cramer, an intimate friend of Klopstock, and with her husband. (See "Memoirs of Frederick and Margaret Klopstock," English translation, by Elizabeth Smith, London, 1808; and her correspondence with Richardson, 1818.) Klopstock resided now alternately in Brunswick, Quedlinburg, and Blankenburg, till 1763, when he returned to Copenhagen. In 1771, on Bernstorff's withdrawal from the ministry, he went to Hamburg with the rank of a councillor of the Danish legation. In 1792 he contracted a second marriage with Johanna Elisabeth von Dimpfel, whose first husband had been a nobleman named Windhem. He lived in Hamburg until his death, occasionally visiting literary friends in various parts of Germany. A pension was conferred upon him by the prince of Baden, and honorary citizenship by the French revolutionists. His death was looked upon in Germany as a national calamity, and his funeral was celebrated with the pomp and solemnity generally accorded only to royal personages.—The last two volumes of his "Messiah" and the greater portion of his odes appeared from 1769 to 1773. He wrote various grammatical and philological works and sacred dramas, or rather dramatic poems, chiefly turning upon characters of the Old Testament, as "The Death of Adam," "Solomon," and "David;" also several patriotic dramas (*Bardiete*), in commemoration of the national hero Hermann. Novalis (Hardenberg) says Klopstock's works resemble translations from some unknown poet, prepared by a skilful but unpoetical philologist. Goethe remarked in his conversations with Eckermann that German literature was greatly indebted to Klopstock, who was in advance of his times, but that the times had since advanced beyond Klopstock. Goethe in his autobiography also records his personal impression of Klopstock: "He was of small stature, but well built. His manners were grave and decorous, but free from pedantry. His address was intelligent and pleasing. On the whole, one might have taken him for a diplomatist. He carried himself with the self-conscious dignity of a person who has a great moral mission to fulfil. He conversed with facility on various subjects, but rather avoided speaking of poetry and literary matters." His works have gone through many editions. Among the English translations of the "Messiah" is one into prose by Mrs. and Mr. Collyer, and a metrical translation appeared in London in 1825-'6. The "Death of Adam" and "Solomon" have also been translated into English, as well as his "Odes," the latter by W. Nind (London, 1848).—See also Miss Benger, "Klopstock and his Friends" (London, 1814); Mörikofer, *Klopstock in Zürich* (Zürich, 1851); and a French essay on

him by Dietz (Paris, 1859). D. F. Strauss has an essay on Klopstock in his *Kleine Schriften* (Berlin, 1866).

**KNABL, Joseph**, a Tyrolese sculptor, born at Fliess in 1821. He is the son of a farmer, and studied first under a local artist, and subsequently in Munich, where he became in 1863 professor in the academy. He excels in mediæval statuary. His principal works represent religious subjects, as his "St. Anne and Mary," for the Eichstädt cathedral, which obtained a prize in 1858 and his admission to the academy, and his masterpiece, the "Coronation of Mary," for the high altar of the church of Our Lady in Munich.

**KNAPP, Albert**, a German poet, born in Tübingen, July 25, 1798, died in Stuttgart, June 18, 1864. After becoming pastor at Stuttgart, he applied himself to poetry, especially to the composition of hymns, and published a small volume of them annually between 1833 and 1853, under the title of *Christoterpe*. Among his other publications are three collections of poems (Stuttgart, 1829, 1834, and 1843), and *Evangelischer Liederschatz für Kirche und Haus* (1837; 3d ed., 1865), taken from the liturgies and hymns of every Christian century.

**KNAPP, Georg Christian**, a German theologian, born in Halle, Sept. 17, 1753, died there, Oct. 14, 1825. He was educated in the orphan school at Halle, founded by Francke, of which his father was director, and in the universities of Halle and Göttingen. In 1777 he became extraordinary, and in 1782 ordinary professor of theology at Halle, maintaining a system of rational supernaturalism, seeking to harmonize revelation with the theoretical and the practical reason. His *Vorlesungen über die Christliche Glaubenslehre* has been translated into English, with additions, by Leonard Woods, jr., D. D.

**KNAPP, Jacob**, an American clergyman, born in Otsego co., N. Y., Dec. 7, 1799, died in Rockford, Ill., March 2, 1874. He entered the theological institution at Hamilton, N. Y., in 1821, and began active work as pastor of the Baptist church in Springfield, N. Y., where he also managed a farm. From thence he moved to Watertown, N. Y., where also he was at the same time pastor of a church and manager of a large farm, displaying a full degree of energy and capacity in each occupation. In 1832 he experienced deeper religious impressions, which he himself was accustomed to call his second conversion; and from that time he gave up his secular employment, and undertook a wider work as an evangelist. He applied to the New York state Baptist convention for appointment as their missionary; but as they hesitated to appoint him, he began preaching as an evangelist on his own responsibility. He preached at first in school houses and obscure churches, but was soon sought by the largest churches and most distinguished pastors. In Baltimore, Boston, and New York vast num-

bers attended his preaching, and such excitement prevailed that mobs threatened him and his hearers, and the protection of the civil authorities was necessary. His preaching was stern and terrible, yet cultivated and able men were moved by it, as well as the populace. Thousands believed themselves converted under his ministry. A few years before his death he visited California. In his old age he had acquired, by several judicious business investments, a comfortable competency, which he proposed shortly before his death to distribute among the benevolent societies of his church.

**KNAPP, Ludwig Friedrich**, a German chemist, born at Michelstadt, Hesse-Darmstadt, Feb. 22, 1814. He studied under Liebig, graduated at Giessen as a chemist, and at the mint in Paris as an assayer. He was professor at Giessen from 1841 till the close of 1853, and subsequently in the economical institution of Munich. In 1856 he became inspector of the royal porcelain works, and in 1863 he went to Brunswick to teach chemistry at the polytechnic school. He has published *Lehrbuch der chemischen Technologie* (2 vols., Brunswick, 1847; translated into English by Ronalds and Richardson, 3 vols., London, 1848-'51, and by W. R. Johnson, 2 vols., Philadelphia, 1848-'9), and translated Percy's "Metallurgy" (1862). He has made some remarkable investigations relative to tanning.

**KNAPP, Samuel Lorenzo**, an American author, born in Newburyport, Mass., in 1784, died in Hopkinton, Mass., July 8, 1838. He graduated at Dartmouth college in 1804, studied law, and was admitted to the bar of Massachusetts. He made his first appearance as an author in "Travels of Ali Bey" (18mo, Boston, 1818), a work purporting to give an eastern traveller's experiences of society in Boston and Cambridge. It was followed in 1821 by "Biographical Sketches of Eminent Lawyers and Statesmen and Men of Letters." In 1828, having previously been connected as editor or contributor with several literary journals, he established himself in New York in the practice of his profession. Among his remaining works are: "Lectures on American Literature" (New York, 1829); "Sketches of Public Characters" (1830); "American Biography" (1833); "Life of Aaron Burr" (1835); "The Bachelor and other Tales" (1836); and "Female Biography of different Ages and Nations." He was the author of a variety of occasional public addresses.

**KNAUS, Ludwig**, a German painter, born at Wiesbaden, Oct. 5, 1829. He studied in Düsseldorf, and became famous in 1850 by his admirable genre pictures of humble life. He resided in Paris from 1853 to 1861, in Berlin from 1861 to 1866, and in Düsseldorf from 1866 to 1874, when he was appointed minister of art at Berlin. Besides many portraits, his works include "The Gamblers," "Peasants' Dance," "The Funeral," "A Fair, with a Chief hunted by the Police," "The Gypsies," "The

Golden Wedding," "After Baptism," "The Juggler in the Barn," and more recently "The Coffee Hour" and "Mud Pies." Engravings of his works are especially popular among the German peasantry.

**KNEBEL, Karl Ludwig von**, a German author, born at Wallerstein, Bavaria, Nov. 30, 1744, died in Jena, Feb. 23, 1834. His family were Protestant refugees from the Netherlands. He became an officer in the regiment of the Prussian crown prince, and was subsequently connected with the court at Weimar, and with Goethe, whose confidence he enjoyed. He made excellent translations, especially of Alfieri's "Saul," and wrote poetry. Varnhagen von Ense and Mundt edited his literary remains and correspondence (3 vols., Leipsic, 1835), the latter furnishing a biographical notice, and Guhrauer published Knebel's *Briefwechsel mit Goethe* (2 vols., 1851).

**KNEELAND, Samuel**, an American naturalist, born in Boston, Aug. 1, 1821. He graduated at Harvard college in 1840, and at the medical school of the same institution in 1843, and studied in Paris till 1845. Subsequently he practised medicine in Boston, taught anatomy in the Harvard school, was connected for two years with the Boston dispensary, was for five years secretary of the Boston natural history society, and for two years of the American academy of arts and sciences. He also explored Brazil, the copper region of Lake Superior, and the Hawaiian islands. From 1862 to 1866 he was surgeon in the army, first under Gen. Burnside, but for most of the time serving in New Orleans and Mobile. In August, 1866, he was appointed secretary of the Massachusetts institute of technology, and professor of zoology and physiology in that institution, which posts he still holds (1875). In the summer of 1874 he visited Iceland, at the time of its millennial celebration, for the purpose of studying the volcanic phenomena of that island. He edited the "Annual of Scientific Discovery" from 1866 to 1869, wrote most of the zoological and many medical articles in the "New American Cyclopædia" and the "American Cyclopædia," and has contributed largely to scientific periodicals. Besides a translation of Andry's "Diseases of the Heart" and an edition of Smith's "History of the Human Species," he has published "The Wonders of the Yosemite Valley and of California" (Boston, 1871).

**KNELLER, Sir Godfrey**, an English portrait painter, born in Lübeck, Germany, in 1648, died in London in October, 1723. He was instructed in painting by Rembrandt and Ferdinand Bol in Amsterdam, and afterward in Rome by Carlo Maratti and Bernini, and gained some reputation in Italy, particularly in Venice, for historical compositions. He arrived in London in 1674, and, having obtained an introduction to the king through the duke of Monmouth, was permitted to paint the royal likeness. The manner in which this was executed procured him abundant employment. Upon the death

of Sir Peter Lely he was appointed court painter to Charles II., an honor confirmed by each successive sovereign during the life of the artist. He was knighted by William III., and painted the beauties of his court (which are considered much inferior to Sir Peter Lely's beauties of the court of Charles II.), and was made a baronet by George I. He painted no fewer than ten sovereigns, and an immense number of lesser celebrities. So numerous were his commissions that he was frequently only able to finish the faces of his portraits, leaving the draperies and accessories to be painted by others. He was a covetous man, and acquired considerable wealth. His portraits possess greater value as likenesses of historical personages than as works of art. He is said to have left at his death 500 unfinished portraits on which he had received half the price in advance.

**KNIAZNIN, Franciszek Dyonizy**, a Polish poet, born in Vitebsk, Oct. 4, 1750, died at Kon-skawola, near Pulawy, Aug. 25, 1807. He studied at the Jesuits' college in Vitebsk, entered that order, and after its suppression repaired to Warsaw, where he eventually became secretary to Prince Adam Czartoryski. An unfortunate passion for the eldest daughter of his patron, and the tragic events which brought about the fall of his country, plunged him into melancholy, passing into derangement. His works, of which there are various collections, comprise songs, idyls, fables, several larger poems, and translations.

**KNIEBIS MOUNTAINS**, a principal range of the N. or Lower Black Forest, traversing the borders of Württemberg and Baden, opposite Alsace. They are regarded as a bulwark against France, have been the scene of engagements during the thirty years' and other wars, and contain the watering places of Freiersbach, Petersthal, Griesbach, Antogast, and Rippoldsau, all belonging to the grand duchy of Baden. These have annually about 4,000 visitors. A railway was projected in 1874 across these mountains.

**KNIGHT, Charles**, an English publisher and author, born at Windsor, March 15, 1791, died at Addlestone, Surrey, March 9, 1873. His father was a bookseller at Windsor, and he succeeded to the business. His first publication, which he edited in conjunction with Mr. E. H. Locker, was "The Plain Englishman," a periodical (3 vols., 1820-'22). At Windsor, in 1823, he commenced "Knight's Quarterly Magazine," and continued it in 1824 in London, whither he then removed. This work, in 8 vols. 8vo. contains the earliest literary productions of Macaulay, Praed, Moultrie, and others. In 1827-'8 he published a continuation of the "London Magazine," in which a few years earlier had appeared Carlyle's "Life of Schiller" and De Quincey's "Confessions of an English Opium-Eater." Soon afterward he became connected with the society for the diffusion of useful knowledge, as their publisher and agent, and immediately undertook a series of valuable works, under the sanction of the

society, but generally at his own risk and expense. Foremost were the "Penny Magazine," in three series (1832-'45), which at one time had a circulation of nearly 200,000 copies weekly; the "British Almanac" and "Companion to the Almanac," begun in 1828 and still continued; the "Penny Cyclopædia" (30 vols. small fol., 1833-'56), since condensed as the "National Cyclopædia;" the "Library of Entertaining Knowledge," to which he contributed a volume on "The Elephant" (1831); the "Pictorial History of England," by Craik and Macfarlane, with its continuation entitled "History of the Thirty Years' Peace," by Mr. Knight and Miss Martineau (1840-'50); and the "Gallery of Portraits of Distinguished Men." Several of the above works were edited by Mr. Knight, and all enjoyed much of his supervision. He also edited the "Pictorial Bible" (4 vols. 4to, 1838); the "Pictorial Book of Common Prayer" (1838); the "Store of Knowledge" (1841); "London Pictorially Illustrated" (6 vols., 1841-'4; abridged into the "Cyclopædia of London," 1851); "Old England, a Pictorial Museum of National Antiquities" (2 vols. fol., 1845); the "Weekly Volume," a series extending to 126 vols. (18mo, 1843-'5); "Half Hours with the Best Authors" (4 vols., 1847-'8); "The Land we Live in" (4 vols., 1848); "Cyclopædia of the Industry of All Nations" (1851); "Half Hours of English History" (2 vols., 1853); "Geography of the British Empire" (2 vols., 1853), &c. He won a position as a Shakespearian scholar by his "Pictorial Shakspeare," including a biography and a "History of Opinion, with Doubtful Plays and Index" (8 vols. 8vo, 1839-'41; library edition, 12 vols. 18mo, 1842-'4; national edition, with biography and "Studies," 8 vols. 8vo, 1851-'3); "Plays and Poems, with Glossarial Notes" (7th ed., 1 vol. 8vo, 1857); "Companion Shakspeare" (8 vols. 12mo, 1855-'7), &c. In 1854, having purchased the plates of the "Penny Cyclopædia," Mr. Knight began the "English Cyclopædia," based upon that work, but greatly enlarged and modified (22 vols. 4to, usually bound in 11, with a separate volume of indexes). His own writings more especially are: "Results of Machinery" (1830), and "Rights of Industry, Capital, and Labor" (1831), amalgamated and enlarged under the title of "Knowledge is Power" (1855); "Life of Caxton" (1844), enlarged under the title of "The Old Printer and the Modern Press" (1854); "Varieties" (1844); "New Lamps for Old: Remarks on Mr. Collier's Discovery of the Annotations on Shakspeare" (1851); "Once upon a Time" (1854), a collection of his miscellaneous works; and "The Struggles of a Book against Excessive Taxation," and "The Case of the Authors as regards the Paper Duty," pamphlets which largely contributed to the repeal of the English duty upon paper, as proposed in Mr. Gladstone's budget of 1860. In 1856 appeared the first volume of "The Popular History of England,

an Illustrated History of Society and Government from the Earliest Period to our own Times." This work, the most important of Mr. Knight's writings, was completed in 1862 in 8 vols. 8vo, bringing the British annals down to the final extinction of the corn laws in 1849. The new editions of this work contain an appendix, giving a chronological account of public events, legislation, and statistics until the time of publication. He also wrote an autobiography, "Passages of a Working Life during Half a Century" (3 vols., 1863-'5; abridged American ed., 1 vol., New York, 1874); "School History of England" (1865); "Begg'd at Court" (1867); "Questions on School History" (1868); and "Half Hours with the best Letter Writers" (2 vols., 1866-'8). Mr. Knight's whole life was one of useful and intellectual labor, and it is not too much to say that he was the founder of that description of literature, cheap yet good, which has exercised a very beneficial influence on the minds of his countrymen during the last 50 years. His success as a man of business was not equal to his enterprise. About the year 1860 he received the appointment, through the influence of Lord Brougham, of publisher of the "London Gazette," almost a sinecure, at £1,200 a year. His statue was erected at Windsor in 1874.

**KNIGHT. I. Richard Payne**, an English author, born at Wormsley Grange, Herefordshire, in 1750, died in London, April 24, 1824. Being a sickly child, he was not put to school, nor allowed to study either Latin or Greek at home. In 1764, however, upon the death of his father, he was sent to a grammar school, and in the course of a few years obtained a thorough knowledge of Latin and Greek. In 1771 he came into possession of a large property, and from 1780 to 1806 held a seat in parliament, during the last 22 years as member for the borough of Ludlow, in which he owned a large estate. In 1814 he was appointed a trustee of the British museum, to which institution his unique collection of antiquities, consisting chiefly of ancient bronzes and Greek coins, and valued at £50,000, was bequeathed. His admiration of Greek art having directed his attention to those subjects which illustrate it, he published in 1786 "An Account of the Remains of the Worship of Priapus lately existing at Isernia, in the Kingdom of Naples, to which is added a Discourse on the Worship of Priapus, and its connection with the Mystic Theology of the Ancients" (4to). This work was privately printed, and was attacked on the score of its indelicacy, notwithstanding the author's object was simply to elucidate an obscure point in Greek mythology. In 1791 appeared his "Analytical Essay on the Greek Alphabet" (4to), in which he broached some opinions of questionable value on the use of the digamma, and also exposed the forgery of certain inscriptions claimed to have been found by Fourmont in Laconia, and which had deceived Winckelmann, Heyne, and some of the

best scholars of the age. He next attempted poetry, and published in 1794 a didactic poem entitled "Landscape," followed by "The Progress of Civil Society" (4to, 1796), "A Monody on the Death of the Right Honorable C. J. Fox" (1806-'7), and "Alfred, a Romance in Rhyme" (1823). In 1805 appeared his "Analytical Inquiry into the Principles of Taste," a work characterized by refinement and acuteness of thought, and which proved the most popular of all his publications. His edition of the Iliad and Odyssey, with prolegomena, in which he attempted to restore the digamma, and to relieve the text of the interpolations of later rhapsodists and poets, is now considered of little authority. The prefaces and descriptions of "Specimens of Ancient Sculpture selected from different Collections of Great Britain by the Society of Dilettanti" (fol., 1809-'35) were also written by him. **II. Thomas Andrew**, brother of the preceding, a vegetable physiologist, born Oct. 10, 1758, died in London, May 11, 1838. He graduated at Balliol college, Oxford, and subsequently devoted much time to experiments in vegetable and animal physiology. Some suggestions as to the means of propagating fruit trees, communicated to the royal society in 1795, brought him into great repute. In 1797 he published "A Treatise on the Culture of the Apple and Pear, and on the Manufacture of Cider and Perry," in which the same subject is further developed; and in 1811, "Pomona Herefordensis, or Natural History of the Old Cider and Perry Fruits of the County of Hereford." After his death appeared a collection of his physiological and horticultural papers (8vo, London, 1841).

#### KNIGHTHOOD. See CHIVALRY.

**KNIPPERDOLLING, Bernhard**, a German Anabaptist, born in Münster near the end of the 15th century, executed Jan. 23, 1536. Exiled for several years from his native town, he adopted in Sweden the doctrines of the Anabaptists. On his return to Münster, he united with Rothmann, John Matthias or Matthiesen, John Boccold of Leyden, and others, and being wealthy was able by the favors which he granted to unite the poorer inhabitants against the rich. He was imprisoned, but released by his partisans, and succeeded in banishing the nobility, clergy, and many of the most influential citizens from the city. A council was chosen in 1534, in which the Anabaptists were predominant, and they immediately filled all public offices with their adherents, made Knipperdolling first burgomaster, and proclaimed an equality of estates, polygamy, and community of goods. All who refused to cooperate with them were driven from the city or slain. Knipperdolling was subsequently proclaimed stadtholder, and John of Leyden king, it being prophesied that the latter should be victorious over all the princes and principedoms of the earth. On the capture of the city by a Catholic army in 1535, Knipperdolling was taken

prisoner, and put to death with fearful torture, which he endured with extreme inflexibility. (See ANABAPTISTS, and JOHN OF LEYDEN.)

**KNOBELSDORFF, Hans Georg Wenzeslaus von**, baron, a German architect, born near Krossen, Brandenburg, Feb. 17, 1697, died in Berlin, Sept. 16, 1753. He gave up a colonelcy in 1730 to study painting and architecture, became chief director of royal buildings in Berlin, and designed the Thiergarten, the opera house, and the new wings of the palaces at Charlottenburg and Dessau. His masterpiece is the palace of Sans Souci at Potsdam.

**KNOBLECHER, Ignaz**, a German traveller, born in Carniola, July 6, 1819, died at Gondokoro, Africa, April 13, 1858. He was educated at the Propaganda in Rome with a view to devoting himself to the African mission, and after having been ordained went to Syria, where he passed a year in the study of Arabic. Thence he removed to Khartoom on the Nile, and in 1849 was ordered to ascend that river and establish a mission among some negro tribes near the equator. Accompanied by another priest, Angelo Vinco, he set out, Nov. 13, with the trading party which annually goes up the Nile, and on Jan. 14, 1850, reached the rapids in lat. 4° 49' N., the furthest point till then reached by any expedition. Knoblercher, however, succeeded in stemming the rapids, and on the 16th reached the village of Logwek, in lat. 4° 10'. He examined the Bahr el-Ghazal or Gazelle river, and returning to Germany published an account of his explorations. He afterward fixed his residence at Khartoom, having received the appointment of vicar general apostolic of central Africa.

**KNOT**, the European name of a sandpiper of the genus *tringa* (Linn.), one of the few birds

Knot.

common to the old and new worlds; other names are the ash-colored, red-breasted, gray-backed, and robin snipe; it is the *T. canutus* (Linn.). The length is about 10 in., the extent of wings 20, the bill  $1\frac{1}{2}$ , and the weight 6 oz.; it is the largest of the genus in the United

States. The color of the summer plumage is light gray above, with black and pale reddish spots; rump and upper tail coverts white, with narrow bands and crescents of black; below light brownish red, with under tail coverts, thighs, sides, and under wing coverts white, spotted and barred with brownish black; quills brownish black, with white shafts; tail brownish cinereous, each feather white-edged. In winter the upper parts are darker, with brownish black edgings; below dull ashy white, lightest on abdomen, with numerous longitudinal dark brown lines and spots on the breast and neck. The knot is found throughout eastern North America and Europe. It is a very active bird, nimbly running and wading along the edge of the waves on sandy beaches, searching for minute shell fish and marine worms; the flight is swift, and large flocks perform very beautiful and rapid aerial evolutions. The flesh of the young and fat birds is considered a delicacy.

**KNOUT** (properly **KNUT**), the Russian word for whip, and the name of an instrument of punishment formerly in use in Russia. The culprit was bound to two stakes, and received on his bare back the specified number of lashes from a whip of plaited thongs interwoven with wire; 100 to 120 lashes were considered equivalent to a sentence of death. The whipping was inflicted by the hands of a convict respited from Siberia and kept in prison for that purpose. If a culprit survived this punishment, he was banished for life to Siberia. In earlier times the nose was slit, the ears were cut off, and the letter V, for *vor* (rogue), was branded on the forehead; but this aggravation was abolished by Alexander I. The nobility were legally exempt from the knout, but the privilege was not always respected. The punishment was inflicted on the worst class of criminals, but now and then also on political offenders. The knout was abolished by the emperor Nicholas, who substituted the *pleti*, a kind of lash.

**KNOWLES, James Davis**, an American clergyman, born in Providence, R. I., in July, 1798, died in Newton, Mass., May 9, 1838. His father, a respectable mechanic of Providence, apprenticed him at the age of 12 to a printer. He studied French and Latin without a teacher, and on becoming co-editor in 1819 with Prof. Goddard of the "Rhode Island American," he studied Greek, and at a later period made respectable progress in Hebrew. At the age of 22 he joined the Baptist church, and entered the sophomore class of Columbian college, Washington, D. C. He graduated in 1824, and was immediately appointed tutor, but in December, 1825, was ordained pastor of a church in Boston. In 1832 he was called to the chair of pastoral duties and sacred rhetoric in the Newton theological institution. In 1836 he founded the "Christian Review," a quarterly journal of the Baptist denomination. Visiting New York in the latter part of April, 1838, to

attend the anniversaries of his denomination, he took the smallpox, of which he died. His principal works are a "Memoir of Mrs. Ann H. Judson" (1827), which went through numerous editions, and a "Memoir of Roger Williams, Founder of Rhode Island" (1834).

**KNOWLES, James Sheridan**, a British dramatist, born in Cork, Ireland, in 1784, died at Torquay, England, Nov. 30, 1862. He was the son of James Knowles, a teacher of elocution, and author of a "Pronouncing English Dictionary." In 1792 the family removed to London, and four years later young Knowles produced his first play, a juvenile performance in which he and a number of young amateurs took part. At the age of 22 he made his debut as an actor in the Crow street theatre, Dublin. For about ten years he led an unsettled life, sometimes as an actor, sometimes as a teacher of elocution, and with but moderate success in either occupation. He wrote nothing for the stage worthy of mention till 1815, when his "Caius Gracchus" was produced in Belfast with great success. His next play, "Virginius," in which Macready sustained the leading part at Drury Lane, first made him generally known to the dramatic public; and thenceforth for many years he was one of the leading playwrights in England. His "Beggars of Bethnal Green," "Hunchback," and "Wife" followed; and in the two latter, which are still popular on the stage, the author appeared in leading characters. After engagements in various parts of the United Kingdom he made a successful tour in the United States. On his return to England he produced "The Love Chase," "Woman's Wit," "The Maid of Mariendortp," "Love," "Old Maids," "John of Procida," "The Rose of Aragon," and "The Secretary," all of which enjoyed a fair degree of success, while some are still standard acting plays. His health began to fail after this, and in 1849 a pension of £200 was procured for him, it being represented that the profits of his dramatic writings had never equalled this sum per annum. In 1845 he abandoned the stage, and subsequently became known as an eloquent preacher of the Baptist denomination. Two polemical works, "The Rock of Rome" and "The Idol Demolished by its own Priest," testify to the energy with which he employed his pen in this new calling. He also wrote two novels, "George Lovel" and "Henry Fortescue." A collective edition of his plays was published in 1841-'3 (3 vols., London). He published a collection of his minor writings under the title of "The Elocutionist" (19th ed., 1853). His last years were spent in total retirement on account of sickness.

**KNOX**, the name of nine counties in the United States. **I.** A S. county of Maine, bordering on the Atlantic, bounded E. by Penobscot bay, and intersected by the Medomac and St. George's rivers; area, 330 sq. m.; pop. in 1870, 30,823. It has a productive soil, and

contains a number of small lakes. A portion of the inhabitants are engaged in navigation and fishing. The Knox and Lincoln railroad terminates at the county seat. The chief productions in 1870 were 3,721 bushels of wheat, 15,445 of Indian corn, 12,276 of oats, 25,259 of barley, 190,676 of potatoes, 45,859 lbs. of wool, 395,960 of butter, and 28,014 tons of hay. There were 1,785 horses, 4,608 milch cows, 1,653 working oxen, 3,790 other cattle, 10,600 sheep, and 1,291 swine; 9 manufactories of carriages, 18 of cooperage, 9 of cured and packed fish, 1 of gunpowder, 5 of iron, 39 of lime, 9 of marble and stone work, 9 of saddlery and harness, 6 of sails, 2 of woollen goods, 13 ship-building and repairing establishments, 4 tanneries, 3 currying establishments, 2 flour mills, and 9 saw mills. Capital, Rockland. **II.** A N. W. county of Texas, near the head of the Brazos river, by which and the Big Wichita it is drained; area, 1,275 sq. m. There were no inhabitants enumerated in 1870. Most of the surface is hilly and broken, but in the S. part there is an undulating mezquite prairie. Gypsum is so abundant as to render the water of most of the streams unfit for drinking, and the Wichita and Brazos are contaminated by deposits of salt near their sources. Timber is not abundant; the principal varieties are mezquite and cedar. The soil is a red loam suitable for pasturage and grain. **III.** An E. county of Tennessee, watered by Clinch, Holston, and French Broad rivers; area, 575 sq. m.; pop. in 1870, 28,990, of whom 4,840 were colored. The surface is mountainous, being crossed by Copper ridge, Chestnut ridge, and Bay's mountain. Iron ore, limestone, and marble are abundant, and the soil of the lowlands is fertile. It is traversed by the East Tennessee, Virginia, and Georgia, the Knoxville and Charleston, and the Knoxville and Kentucky railroads. The chief productions in 1870 were 151,232 bushels of wheat, 548,546 of Indian corn, 259,047 of oats, 25,702 of Irish and 24,243 of sweet potatoes, 26,532 lbs. of tobacco, 26,328 of wool, 222,078 of butter, and 5,766 tons of hay. There were 4,907 horses, 4,543 milch cows, 6,795 other cattle, 13,441 sheep, and 22,519 swine; 2 manufactories of saddlery and harness, 1 of sash, doors, and blinds, 1 of machinery, 1 of printing paper, 6 of iron, 2 tanneries, 1 flour mill, and 4 saw mills. Capital, Knoxville. **IV.** A S. E. county of Kentucky, traversed by Cumberland river; area, 600 sq. m.; pop. in 1870, 8,294, of whom 557 were colored. It has a mountainous surface, and abounds in iron ore, coal, and limestone. The chief productions in 1870 were 13,670 bushels of wheat, 214,369 of Indian corn, 36,670 of oats, 11,290 of potatoes, 14,348 lbs. of wool, 78,427 of butter, and 992 tons of hay. There were 1,212 horses, 1,534 milch cows, 3,399 other cattle, 8,372 sheep, and 12,761 swine. Capital, Barbourville. **V.** A central county of Ohio, drained by Vernon and Wadhonding rivers and the N. fork of Licking

river; area, 525 sq. m.; pop. in 1870, 26,338. The surface is undulating, and the soil, particularly in the W. part, is remarkably fertile. The Lake Erie division of the Baltimore and Ohio, and the Cleveland, Mount Vernon, and Delaware railroads pass through it. The chief productions in 1870 were 836,176 bushels of wheat, 20,389 of rye, 1,223,270 of Indian corn, 440,130 of oats, 97,301 of potatoes, 24,887 lbs. of tobacco, 676,603 of wool, 57,988 of maple sugar, 799,366 of butter, and 40,770 tons of hay. There were 9,429 horses, 8,542 milch cows, 12,141 other cattle, 145,613 sheep, and 27,872 swine; 24 manufactories of carriages, 4 of iron castings, 2 of engines and boilers, 1 of linseed oil, 4 of sash, doors, and blinds, 7 of tin, copper, and sheet-iron ware, 3 of woollen goods, 6 tanneries, 2 currying establishments, 13 saw mills, and 8 flour mills. Capital, Mount Vernon. **VI.** A S. W. county of Indiana, bordering on Illinois, bounded W. by the Wabash river, S. by White river, and E. by the W. fork of the White; area, 513 sq. m.; pop. in 1870, 21,562. It has a level surface, occupied in the W. part by prairies, and contains beds of coal. The soil is very fertile. The Evansville and Crawfordsville, the Ohio and Mississippi, and the Indianapolis and Vincennes railroads pass through it. The chief productions in 1870 were 376,950 bushels of wheat, 959,209 of Indian corn, 55,767 of oats, 46,235 of potatoes, 56,237 lbs. of wool, 137,185 of butter, and 7,331 tons of hay. There were 6,415 horses, 4,632 milch cows, 7,571 other cattle, 18,907 sheep, and 33,110 swine; 4 manufactories of carriages, 5 of cooperage, 1 of machinery, 4 of saddlery and harness, 4 of tin, copper, and sheet-iron ware, 3 breweries, 8 saw mills, and 6 flour mills. Capital, Vincennes. **VII.** A N. W. county of Illinois, drained by Spoon river; area, 729 sq. m.; pop. in 1870, 39,522. It has an undulating surface, diversified with prairies and woodlands, a fertile soil, well watered by creeks, and extensive beds of coal. The Chicago, Burlington, and Quincy railroad and the Peoria branch pass through it. The chief productions in 1870 were 275,418 bushels of wheat, 113,547 of rye, 2,708,319 of Indian corn, 787,952 of oats, 12,723 of barley, 147,909 of potatoes, 53,885 lbs. of wool, 668,074 of butter, and 53,014 tons of hay. There were 18,247 horses, 10,997 milch cows, 23,738 other cattle, 16,137 sheep, and 61,768 swine; 8 manufactories of agricultural implements, 9 of brick, 3 of brooms and wisp brushes, 35 of carriages, 1 of cars, 1 of dressed furs, 2 of iron castings, 4 of machinery, 1 of marble and stone work, 10 of masonry, 2 of pumps, 16 of saddlery and harness, 14 of tin, copper, and sheet-iron ware, 1 of woollen goods, 2 wool-carding and cloth-dressing establishments, 5 planing mills, 6 saw mills, and 16 flour mills. Capital, Galesburg. **VIII.** A N. E. county of Missouri, drained by the North, South, and Middle Fabius, and the N. fork of Salt river; area, 512 sq. m.; pop. in 1870, 10,-

974, of whom 200 were colored. It has a nearly level surface, diversified with woods and prairies, and a fertile soil. The Quincy, Missouri, and Pacific railroad passes through it. The chief productions in 1870 were 63,745 bushels of wheat, 573,003 of Indian corn, 257,812 of oats, 10,600 lbs. of tobacco, 62,890 of wool, and 19,065 tons of hay. There were 7,215 horses, 5,417 milch cows, 14,968 other cattle, 24,758 sheep, and 30,765 swine; 10 manufactories of carriages, 10 of brick, 8 of saddlery and harness, 5 of tin, copper, and sheet-iron ware, 1 of woollen goods, 4 saw mills, and 3 flour mills. Capital, Edina. **IX.** A. N. E. county of Nebraska (formerly called L'Eau Qui Court), separated from Dakota by the Missouri and Niobrara rivers; area, about 1,000 sq. m.; pop. in 1870, 261. The chief productions were 1,309 bushels of wheat, 3,610 of Indian corn, 3,210 of potatoes, and 1,012 tons of hay; value of live stock, \$20,610. Capital, Niobrara.

**KNOX, Henry**, an American general, born in Boston, July 25, 1750, died in Thomaston, Me., Oct. 25, 1806. He was of Scotch and Irish Presbyterian stock, and his father came from St. Eustatius, one of the Dutch West India islands. He received the common school education of his time in Boston, where he became a thriving bookseller, his shop being a favorite resort of cultivated persons. He was an officer in Major Dawes's corps of grenadiers, and by practice and study became an adept in military science. He married Miss Lucy Fluker, a daughter of the provincial secretary. Shortly before the battle of Bunker Hill he managed to escape the guards of Gen. Gage with his wife, and to make his way to Cambridge with his sword carefully concealed in the folds of her dress. He was actively engaged in that battle as a volunteer aid to Gen. Ward, reconnoitring the movements between the heights and the headquarters; and upon his reports Ward issued his orders. He soon attracted Washington's attention by his skill as an engineer in planning and constructing fortifications, and as an artilleryman. Attached to the regiment of artillery which had been formed under the veteran Gridley, he was soon raised to its command. He was sent in quest of cannon and ordnance stores, and succeeded in bringing to camp early in 1776 a long train of sledges bearing more than 50 cannon, mortars, and howitzers, which proved of great service in the siege and bombardment of Boston. He subsequently took the management of all the artillery in New York. He was almost the last officer to leave the city, remaining so late that he escaped capture only by seizing a boat and making his way by water. He distinguished himself in the New Jersey campaign, and on Jan. 2, 1777, his well directed cannonade repulsed Cornwallis in repeated attempts to pass the Assumpink. He shared in the brilliant action at Princeton on the following day. Having been made by congress brigadier general of the artillery, he

was sent to Massachusetts to expedite the raising of a battalion of artillery, and became the organ of communication with the executive council of the state concerning the military events of that year. At the battle of Brandywine the fire of the artillery against Knyphausen at Chad's ford was maintained by Knox with vigor from morning till evening. The failure at Germantown was partly attributed to his tenacious adherence to the military maxim never to leave an enemy's fort in the rear, causing the pursuit to be abandoned at Chew's garrisoned house. After the fall of Fort Mifflin, Nov. 15, 1777, he was sent with De Kalb and St. Clair to provide for the security of Red Bank. He passed the winter at Valley Forge, laboring to improve the discipline and efficiency of the army, and was prominently engaged in the hot battle of Monmouth, June 28, 1778. In the general order after the battle Washington had "the satisfaction to inform Gen. Knox and his officers that the enemy had done them the justice to acknowledge that no artillery could be better served than theirs." Knox accompanied Washington and Lafayette to Hartford to mark out their future plans of cooperation, and returned by way of West Point, where he sat on the court martial for the trial of André. In the ensuing winter he was again sent to New England to gather men and means for the next campaign. During the heaviest part of the cannonade at Yorktown, Knox was in the grand battery by the side of Washington. He was now advanced by congress to the rank of major general, and was commissioned with Gouverneur Morris to arrange the exchange of prisoners and settlement of expenses. He was placed in command at West Point after the announcement of the cessation of hostilities, and on him devolved the delicate task of disbandment. He was appointed to arrange the surrender of New York with Sir Guy Carleton. After the peace he was a candidate with Greene and Lincoln for the secretaryship of war, in which office he succeeded the latter in March, 1785. There was no separate department for the navy, and its duties therefore devolved chiefly on him. He retained his department after the organization of the new government. In December, 1795, following the example of Hamilton, he retired from the cabinet, and removed to St. Georges in Maine for the improvement of an estate, acquired partly in the right of his wife and partly by purchase, upon which he expended large amounts. When in 1798 the army was reorganized at the prospect of war with France, his feelings were deeply wounded by the cabinet's reversal of President Adams's order of appointments, and the precedence assigned to Hamilton in the new military arrangements. His proposal was to serve as aide-de-camp to Washington.—See "Life and Correspondence of Henry Knox," by Francis S. Drake (Boston, 1874).

**KNOX, John**, a Scottish religious reformer, born at Gifford, Haddingtonshire, or at Gifford-

gate, a suburb of Haddington, in 1505, died in Edinburgh, Nov. 24, 1572. After receiving his preliminary education at the grammar school of Haddington, he was sent about 1524 to the university of St. Andrews, was ordained, and prior to 1530 became a teacher of philosophy there. The study of the fathers, especially of Jerome and Augustine, had shaken his religious opinions as early as 1535, but it was not till 1542 that he became an avowed and marked reformer. His reprehension of certain practices of the church caused him to retire from St. Andrews to the south of Scotland, where he was declared a heretic, degraded from his office, and threatened by assassins. In default of more definite occupation, he became tutor to the sons of two noble families, listened to the reformed teachers, and occasionally preached to the inhabitants of the surrounding country. After the death of his friend George Wishart he remained in retirement till, nearly a year after the murder of Cardinal Beaton, he took refuge with many other Protestants (1547) in the castle of St. Andrews, which the regent was vainly attempting to reduce. There for the first time he administered publicly both elements of the eucharist, and became known as a powerful preacher against the papacy. The regent, reinforced by a French squadron, obliged the garrison to surrender. The terms of the capitulation were violated, and Knox with his comrades was transported to France, where he was imprisoned in the galleys for 19 months. He experienced extreme hardships, and on his release (1549) directed his course to England, where he was appointed to preach at Berwick and at Newcastle, and became one of the chaplains of Edward VI. For the boldness of his discourses he was several times called to account, but he was able to vindicate himself. A bishopric was offered to him, but he declined it from scruples as to the divine authority of the episcopal order. On the accession of Queen Mary he fled to Dieppe, and passed thence to Geneva. In November, 1554, he took charge of the chapel of the English emigrants in Frankfurt, but resigned soon after because his congregation was in favor of retaining the liturgy. He returned to Geneva and thence to Scotland, where he labored for the spread of the reformation. Dissatisfied with the slow progress of the movement in his native land, he returned to Geneva in 1556, where he became pastor of a small English congregation. The 30 months of his residence in Geneva, in the society of Calvin, Beza, and other learned men, were among the happiest of his life. While in Scotland he had been cited to appear before an assembly of the clergy to be held at Edinburgh, but his opponents avoided the discussion when they found him ready to meet it, supported by persons of influence. But after his return to Geneva the citation was renewed, and he was condemned to be burned as a heretic, and the sentence was executed on his effigy. Against

this condemnation he published the "Appellation of John Knoxe." He also wrote "A Letter to Queen Mary, Regent of Scotland," and a tract entitled "The First Blast of the Trumpet against the Monstrous Regiment of Women" (1558), a vehement attack on political government by women, at a time when Mary of Guise was regent of Scotland and Mary Tudor queen of England, and the nearest in succession to both thrones were females. Invited by the Scottish Protestants to resume his labors in his native country, he landed at Leith in 1559, and rejoiced that he had come "even in the brunt of the battle." The queen regent, throwing off all disguise, had laid her plans for the forcible overthrow of the reformation. At a convention of the nobility and clergy in Edinburgh all the demands of the Protestants were refused. Several of the reforming preachers were summoned to appear at Stirling for trial, but by the dissimulation of the regent were prevented from attending and then outlawed for their failure. Knox hastened to meet them at Perth, where the Protestant preachers had assembled at the summons of the queen. Soon after his arrival he preached against the idolatry of the mass and the veneration of images. At the conclusion of the service a priest ventured to make preparations for celebrating mass, which roused the people to immediate action. The images in the churches were demolished, the pictures torn from the walls and trampled under foot, the holy recesses invaded, and the "rascal multitude," as Knox calls them, did not stop till they had sacked and laid in ruins the houses of the Dominican and Franciscan friars and the Carthusian monastery. The queen regent advanced upon Perth with a considerable army, but, finding the Protestants well prepared for resistance, proposed terms of accommodation which were accepted. The Protestants, in order to consolidate their strength, formed a religious bond or covenant, and began to be distinguished as the congregation, and their leaders as the lords of the congregation. Iconoclasm was a prominent feature in the Scottish reformation. Events similar to those at Perth followed at Stirling, Lindores, Cupar, St. Andrews, and other places. Knox had preached in the cathedral of St. Andrews against the advice of his friends and the threats of the archbishop, and with such success that the magistrates united with the inhabitants in desolating the churches and monasteries, and in establishing the reformed worship. Meantime civil war raged throughout the kingdom between the regent, assisted by French troops, and the lords of the congregation, who implored the succor of Elizabeth. In political as well as ecclesiastical affairs Knox was a conspicuous adviser, and took up his residence in Edinburgh after an extensive circuit through the southern and eastern counties. After a contest of 12 months, marked by many atrocities, the vigorous assistance rendered by Elizabeth, and the death of

the queen regent while the English troops were investing Edinburgh, led to a truce and to the summons of the parliament to settle differences. Parliament assembled in August, 1560, and the reformed religion was established, and Roman Catholicism interdicted by law in Scotland. Knox retained the office of minister in the metropolis, and soon after the arrival of the young Queen Mary (Aug. 21, 1561) he was summoned to her presence. Six interviews are recorded between him and the queen, and the questions which she raised were discussed by him with a freedom and rigor which once drove her to tears. She caused his arrest on a charge of treason in 1563, but all the councillors except the immediate dependants of the court voted for his acquittal. The vehemence of his public discourses led him into frequent difficulties. In 1562 he disputed publicly for three days with Abbot Quentin Kennedy at Maybole; in 1565 he quoted certain texts which gave offence to the queen's consort (Darnley), and was for a short time prohibited from preaching; he fled from Edinburgh when Mary returned from Dunbar after the death of Rizzio; and he preached a sermon at the coronation of the infant James VI. at Stirling, July 29, 1567. Under the brief regency of Moray the work of Knox seemed to be completed, and he thought of retiring to Geneva to end his days in peace. After the assassination of Moray, civil and religious confusion returned under the regency successively of Lennox and Mar. Weakened by a stroke of apoplexy in 1570, Knox yet reappeared in the pulpit, while Kirkaldy of Grange and others of his friends were forsaking the cause of the reformation, and while he differed from his brethren in the assembly about praying for the queen. So violent was the enmity excited by his animadversions, that, following the advice of his friends, he left Edinburgh for St. Andrews, May 5, 1571. He returned in the following year, and his last energies were put forth in denunciations of the perpetrators of the massacre of St. Bartholomew's.—The doctrines of Knox embraced a Calvinistic creed and a Presbyterian polity. The "Order of Geneva," a liturgy which he shared in preparing for the use of the church at Frankfort, and subsequently employed in his congregation at Geneva, was introduced into Scottish Protestant churches in 1565. He introduced the Puritan element into those churches. The office of bishop he declined, disapproving what he regarded as unscriptural ceremonials. Chiefly through his influence the adoration of the sacrament was abolished in the Book of Common Prayer, which, by desire of the government, he aided in preparing under Edward VI. His character was marked by a stern realism, which could be beguiled by no social pretensions, no conventional dignities, no pompous traditions. From this sprang his scornful bitterness and his insensibility to the social graces and refinements which Mary exhibited person-

ally, and sought to transplant from Paris to her native land. His preaching was distinguished for a headlong and vehement energy, which, as the English ambassador said, "put more life into him than 600 trumpets." Earnest and intense in every practical direction, his mind was not at all of a reflective or speculative cast, and as a thinker, save perhaps on political subjects, he takes no rank; his political views rather sprang from an instinctive sense than from the development of fundamental principles. The best known of his writings is the "Historie of the Reformation of Religion within the Realm of Scotland" (1584; mutilated ed. by David Buchanan, London and Edinburgh, 1644; complete ed., Edinburgh, 1732; after the most trustworthy manuscript, with other writings of Knox, by MacGavin, Glasgow, 1831). The collected edition of his works edited by David Laing is probably the most correct (6 vols., Edinburgh, 1846-56). The principal biography of Knox is that by Thomas McCrie (1812; 6th ed., 1839). His biography in the 10th volume of Brandes's *Leben und ausgewählte Schriften der Väter und Begründer der reformirten Kirche* (Elberfeld, 1862) is a valuable study.

**KNOX, Vicesimus**, an English clergyman, born at Newington Green, Middlesex, Dec. 8, 1752, died in Tunbridge, Kent, Sept. 6, 1821. He was educated at St. John's college, Oxford. In 1778 he was elected master of Tunbridge school, and continued there for 33 years, and then settled in London. He is best known as the editor of the compilation entitled "Elegant Extracts." His "Christian Philosophy" has passed through numerous editions. His works, with a biographical preface, were published in London in 1824 (7 vols. 8vo), including "Essays, Moral and Literary."

**KNOXVILLE**, a city and the county seat of Knox co., Tennessee, situated at the head of steamboat navigation on the right or N. bank of the Holston river, 4 m. below the mouth of the French Broad, and 165 m. E. of Nashville; pop. in 1870, 8,682, of whom 2,609 were colored; in 1874, including suburbs, about 12,000. It is built on a healthy and elevated site, commanding a beautiful view of the river and surrounding country, and is the point of intersection of the East Tennessee, Virginia, and Georgia railroad with the Knoxville and Ohio and Knoxville and Charleston lines. It is the principal commercial place of East Tennessee, and has a large wholesale trade in dry goods, hardware, boots and shoes, drugs, groceries, &c., with that part of the state and with the neighboring portions of the adjoining states. The chief manufactures are of iron, embracing nails, bar iron, car wheels, &c. There are also sash and blind factories, flouring and saw mills, and four banks with an aggregate capital of \$270,000. It is the seat of East Tennessee university, with which is connected the state agricultural college, and which in 1873 had 14 professors and instructors, 325 students (125 collegiate), and a library of 1,200

volumes, and of the state institution for the deaf and dumb. It has recently been selected as the site of the Knoxville university (Methodist), and of the freedmen's normal school to be established by the Presbyterians. There are several public and private schools, two daily and four weekly newspapers, a monthly periodical, and 20 churches.—Knoxville was settled in 1789, and received its name two years later in honor of Gen. Henry Knox. From 1794 to 1817 it was the territorial and state capital. For a brief period during the civil war Knoxville was a point of considerable strategical importance. It had been held by the confederates, who abandoned it early in September, 1863, upon the approach of the Union force under Gen. Burnside. Soon after the federal reverse at Chickamauga, Sept. 19, 20, Longstreet was sent to operate against Burnside, who was strongly entrenched at Knoxville. Longstreet made a vigorous and partially successful assault, Nov. 18, and as Burnside had provisions for only three weeks, the confederates hoped to reduce him by famine. But Bragg was signally defeated at Chattanooga, Nov. 24, 25, and a strong federal force under Sherman moved toward Knoxville. Longstreet thereupon ventured (Nov. 29) upon an assault on Fort Sanders, the key to the federal position. It was repulsed, the confederates losing about 500 men, the federals less than 50; and the siege was virtually raised, although Longstreet did not finally retire till Dec. 5.

**KNYPHAUSEN, Baron**, a German soldier, born in Alsace about 1725, died in Berlin in June, 1789. His father commanded a regiment under the duke of Marlborough, and his own military career commenced in the service of Frederick William I. of Prussia. Subsequently he served in the several wars waged by Frederick the Great against Austria. In 1776 he received from the British government the command of 12,000 Waldeckers and Hessians hired to aid in repressing the insurrection in the American colonies, and arrived in New York in time to participate in the battle of Long Island in August. He was present at White Plains, and aided in the capture of Fort Washington in November, and in the defeat of the American forces at Brandywine in 1777. In June, 1780, being then in temporary command of the British troops in New York, during the absence of Sir Henry Clinton, he made a descent into the Jerseys with 5,000 men, in the hope of rallying the disaffected Americans to the royal standard; but he accomplished little beyond sacking the village of Connecticut Farms. On the 23d he reentered the Jerseys with reinforcements, and after an indecisive conflict with Gen. Greene, and burning the village of Springfield, he returned to Staten Island.

**KOALA**, or **Kangaroo Bear**, a marsupial animal of the phalanger family and genus *phascolarctos* (De Blainville), the *P. cinereus* (Fisch.). The dental formula is: incisors  $\frac{2}{2}$ , canines  $\frac{1}{1}$ , premolars  $\frac{1}{1}$ , molars  $\frac{4}{4}$ =30; the posterior

upper incisors and canines are small, and the crowns of the molars have four tubercles. The body is stout; the head moderate, with a very short facial portion and naked muffle; ears moderate and clothed with long hairs; eyes large and not protected by lashes; moustaches small and scanty. The toes of the fore feet are in two sets, one composed of the two inner (which are the shortest), and the other of the three outer, of which the central is the longest, and all have long, curved, and compressed claws; the two portions of the feet are slightly opposable; the first toe of the hind feet is very far back, large, and without a nail. The stomach is provided with a cardiac glandular apparatus, and the cæcum is three times as long as the animal; the pouch is well developed; the tail is wanting. The koala is about 2 ft. long, 10 or 11 in. high, with a girth of 18 in.; the limbs are powerful, and the large hands and feet admirably adapted for climbing trees; the fur is dense, soft, and woolly, of a

Koala (*Phascolarctos cinereus*).

general ashy gray color, inclining to brown; hinder part of back dirty yellowish white, under parts dirty white, and inside of hind limbs rusty brown. It inhabits New South Wales, where the natives hunt it for the flesh, pursuing it into the tops of the highest gum trees, in which it passes the day feeding on the tender shoots or sleeping; it descends the trees at night in search of roots, which it digs up with its powerful claws. On the ground it creeps slowly, and when climbing looks like a small bear; when angry it assumes a fierce look and utters a shrill cry. Koalas are found in pairs, and the mother carries her young one on her back when it has outgrown her pouch; they are very tenacious of life. The skull is remarkable for its oblong quadrate form, great width of nasal bones, length of zygomatic arches, auditory protuberances, and depth of rami of lower jaw.

**KOBELL, Franz von**, a German mineralogist, born in Munich, July 19, 1803. He is professor of mineralogy at Munich, and has popularized

that science by a series of publications which have passed through many editions, including a complete history of mineralogy from 1650 to 1860, to form part of the *Geschichte der Wissenschaften in Deutschland* (1864), an elaborate work which was undertaken under the auspices of the late king Maximilian of Bavaria. He has also published several volumes of dialect poems, which have acquired great popularity.—Several of his ancestors and relatives in Germany and Holland were distinguished artists.

**KOCH, Karl Heinrich Emanuel**, a German traveller, born in Weimar in 1809. He studied the natural sciences and medicine at Würzburg and Jena, and undertook in 1836 a scientific journey through the southern provinces of Russia and the Caucasus, of which he published a narrative (2 vols., Stuttgart, 1842-'3). In a second journey in 1843-'4 he extended his researches through Turkey and Armenia to the Caspian sea, obtaining the materials for a new work, *Wanderungen im Orient* (3 vols., Weimar, 1846-'7). On the outbreak of the eastern war, vol. iii. of the latter work was published separately under the title of *Die Krim und Odessa* (Leipzig, 1854; translated by Korner, London, 1855). He has also published *Hortus Dendrologicus* (Berlin, 1853-'4), *Gärtnerkunst und Pflanzenphysiognomie* (1859), and *Der botanische Garten* (1860).

**KOCHANOWSKI, Jan**, a Polish poet, born in the palatinate of Sandomir in 1532, died in Lublin in 1584. He studied in Germany, France, and Italy, and after his return to Poland was employed by King Sigismund Augustus in various missions. His lyrical productions in both Polish and Latin gained him the appellation of the Polish Pindar. Among his writings are a translation of the Psalms in Polish verse, various satires, and a drama. The editions of his works are numerous.

**KOCK. I. Charles Paul de**, a French novelist and dramatist, born at Passy, near Paris, May 21, 1794, died in Paris, Aug. 29, 1871. The son of a Dutch banker, who had removed to France, and who died on the scaffold during the revolution, he was carelessly educated under his mother's supervision, and entered a banking house in the capacity of a clerk. In 1812 he printed at his own risk his first novel, *L'Enfant de ma femme*, which was unsuccessful. He then produced a number of melodramas, vaudevilles, and comic operas, which brought him into notice. In the mean time he published several lively but not very decent tales and novels, which increased his popularity until he became the great favorite of a large class of readers, both in France and abroad, his publications being rapidly translated. His dramatic works number over 100. Many of his novels and vaudevilles were written in part by others, and several bear his name without being his work. Prominent among his literary assistants were Boyer, Varin, Labie, and his own son. See his *Mémoires inédits* (Paris, 1873). **II. Henri de**, a novelist and dramatist, son of the prece-

ding, born in Paris in 1821. He writes with the same fecundity and in nearly the same style as his father. His works now number about 100, and many of them were written with the assistance of Barrière, Fournier, and Gonzalès, and of his father.

**KOEKKOEK, Bernard Cornelis**, a Dutch landscape painter, born in Middelburg, Oct. 11, 1803, died in Cleves, April 5, 1862. He was the son of the celebrated marine painter Johannes Herman Koekkoek. At the great exposition in Paris in 1855 he received a medal of the first class. For many years previous to his death he resided in Cleves, where he established a school of design.—His brothers MARIANUS, ADRIAN, and HERMAN also enjoy a high reputation as painters.

**KOENIG, Heinrich Joseph**, a German novelist, born in Fulda, March 19, 1790, died in Wiesbaden, Sept. 23, 1869. He was connected with the civil service and the diet of Hesse-Cassel till 1850. In 1860 he removed from Hanau to Wiesbaden. His principal historical novels are *Die hohe Braut* (Leipzig, 1833), *Die Clubbisten im Mainz* (1847), *Die Waldenser* (2d ed., 1857, under the title *Hedwig die Waldenserin*), and *William Shakspeare* (3d ed., 1850-'59). His works were published in 20 vols., 1854-'69.

**KOH-I-NOOR.** See DIAMOND, vol. vi., p. 75.

**KOHL, Johann Georg**, a German traveller and author, born in Bremen, April 28, 1808. He was educated at Göttingen, Heidelberg, and Munich, and after serving five years as a private tutor in Courland, a visit to St. Petersburg and the interior of Russia afforded materials for publications which were so favorably received that he decided to devote his life to travel. He visited England, Holland, Denmark, France, Austria, Hungary, and other parts of Europe; was in the United States and Canada in 1854-'8; and published volumes of travel respecting every country he visited. He also wrote some scientific treatises, as *Der Verkehr der Menschen in seiner Abhängigkeit zu der Erdoberfläche* (1841), *Der Rhein* (1851), *Die Donau* (1853), *Skizzen aus Natur- und Völkerleben* (1851), and a series of essays entitled *Aus meinen Hütten* (1852). Several of his works have been translated into English, among which are "Kitchi-Gami: Wanderings round Lake Superior" (London, 1857), "Travels in Canada and through the States of New York and Pennsylvania" (1861), and "A Popular History of the Discovery of America, from Columbus to Franklin" (1862). In 1857 he contributed to the Smithsonian institution two papers on the maps and charts of America at different periods, and wrote a supplemental volume to Hakluyt's work, giving a descriptive catalogue of all the maps, charts, and surveys relating to America. Some years later he sent to the Maine historical society a paper giving new and important information respecting the early coast lines and the patents of the first proprietors of the Maine settlements. Among his later publications are: *Geschichte*

*der Entdeckung von Amerika* (1861; translated into English, London, 1862); *Die beiden ältesten Karten von Amerika* (1861); *Vom Markt und aus der Zelle* (2 vols., 1868); and *Die geographische Lage der Hauptstädte Europas* (1874).—His sister, **IDA KOHL** (born July 25, 1814, and married in 1846 to Count Hermann von Baudissin), wrote in connection with him the *Englische Skizzen* (1845) and separately *Paris und die Franzosen* (1845).

**KOHLRAUSCH, Heinrich Friedrich Theodor**, a German author, born near Göttingen, Nov. 15, 1780, died in Hanover, Jan. 31, 1867. He was from 1830 a teacher in Hanover. His most popular books were *Die deutsche Geschichte* (Elberfeld, 1816; 15th ed., Hanover, 1866; abridged, 10th ed., Gütersloh, 1867; translated into English, 1847), and *Chronologischer Abriss der Weltgeschichte* (15th ed., Leipsic, 1861). In 1863 appeared his autobiography (*Erinnerungen aus meinem Leben*).

**KOKOMO**, a town and the county seat of Howard co., Indiana, situated on Wild Cat creek, an affluent of the Wabash, and at the intersection of the Indianapolis, Peru, and Chicago with the Pittsburgh, Cincinnati, and St. Louis railroad, 50 m. N. of Indianapolis; pop. in 1870, 2,177. It contains a number of manufactories, a national bank, and three weekly newspapers. It is the seat of Howard college, organized in 1869, which in 1872 had 5 professors and instructors, and 69 students.

**KOLA**, a town of Russia, capital of the circle of Kem, in the government and about 360 m. N. W. of the city of Archangel, in the N. W. part of the peninsula of Kola, and at the confluence of the rivers Kola and Tuloma, 36 m. from the Arctic ocean; lat. 68° 50' N., lon. 33° 15' E.; pop. in 1867, 1,062, including Lapps and a few Finns. It is noticeable as the most northern town of European Russia, and the former capital of the old Russian Laplandish territory. It has a good harbor, and contains three churches and a school. It was bombarded by the allies during the eastern war, Aug. 23, 1854.

**KOLAPOOR**, a native state of the Deccan, India, under the political management of the presidency of Bombay, bounded N. and N. E. by Sattara, E. and S. by Belgaum, and W. by Sawunt Warree and Rutnagherry; area, 3,500 sq. m.; pop. about 500,000. It is traversed by the Ghaut mountains, and by the Kistnah and other rivers. The soil is exceedingly fertile, despite the ruggedness of the country. The principal races are the Mahrattas and Ramooses. The rajahs of Kolapoor boast of their descent from the founder of the Mahratta empire; but their authority has become within the last 30 years only nominal, the English being the actual rulers.—**KOLAPOOR**, the capital, 185 m. S. E. of Bombay, long notorious for its unhealthy condition, has been lately improved.

**KOLB, Georg Friedrich**, a German journalist and author, born at Spire, Sept. 14, 1808. He published a journal in Spire in 1830, which he

edited for more than 20 years in the liberal interest, and was a member of the Frankfort parliament in 1848. As member of the Bavarian chamber he prepared a report on the so-called Greek loan, which required the ex-king Louis I. to replace from his private means the entire amount which had been paid to his son King Otho of Greece. To escape from persecutions, he remained in Zürich from 1853 to 1860. Subsequently he edited the *Frankfurter Zeitung*, and in 1863 he resumed his seat in the Bavarian chamber. He opposed the Franco-German war of 1870-'71, and advocated the right of suffrage for the people of Alsace-Lorraine. His principal works are: *Handbuch der vergleichenden Statistik* (1858; 6th ed., 1871); *Grundriss der Statistik* (1862; 4th ed., 1871); and *Culturgeschichte der Menschheit* (2 vols., 1869-'70; 2d ed., 1874).

**KOLBE, Adolf Wilhelm Hermann**, a German chemist, born near Göttingen, Sept. 27, 1818. He studied under Wöhler, and became in 1842 assistant to Bunsen, whom he succeeded in 1851 as professor in the university of Marburg, after having been in the interval employed by Playfair in London, and edited Liebig and Wöhler's *Handwörterbuch der Chemie*. In 1865 he became professor at Leipsic. His principal works are: *Das ausführliche Lehrbuch der organischen Chemie* (vols. i. and ii., Brunswick, 1854 and 1863), *Das chemische Laboratorium der Universität Marburg* (Marburg, 1865), and *Die Entwicklung der Chemie in der neuesten Zeit* (Munich, 1871 et seq.).

**KOLBE, Karl Wilhelm**, a German painter, born in Berlin in 1781, died there, April 8, 1853. He was the nephew of an engraver and author of the same name (1757-1835), and became known in 1806 by his "Albert Achilles victorious in Nuremberg," and subsequently by many other works for Prussian churches and palaces, including "The Princess off for the Falcon Chase," "The Battle of Otho the Great against the Huns," and "A Vintage Festival in the Middle Ages."

**KOLBERG**. See **COLBERG**.

**KÖLCSEY, Ferencz**, a Hungarian author, born in the county of Middle Szolnok, Aug. 8, 1790, died in Pesth, Aug. 24, 1838. He studied at the Protestant college of Debreczin, and, though deprived by an accident of one of his eyes, early distinguished himself. In 1809 he was appointed notary of the royal court at Pesth, and in 1826, with Paul Szemere, started a literary periodical under the title of *Élet és irodalom* ("Life and Literature"). In the diet of Presburg of 1832-'6 he acquired new fame, and when Wesselényi was arraigned for treason by the Austrian government, Kölcsey undertook his defence, but died suddenly soon after. His "Works," embracing songs, ballads, satires, short novels, critical writings, and some of his orations, were collected after his death, to which was added after the outbreak of the revolution of 1848 his "Diary during the Diet of 1832-'6."

**KOLDEWEY, Karl**, a German explorer, born at Bücken, Hanover, Oct. 26, 1837. He qualified himself for maritime life in the Bremen commercial navy, at the polytechnic school of Hanover, and at the university of Göttingen. He commanded in 1868 the first, and in 1869 the second arctic expedition sent out by Dr. Petermann, and published accounts of them in that geographer's *Mittheilungen*. In 1871 he became first assistant in the observatory at Hamburg, and prepared under Dove's direction the meteorological and hydrographical results of the arctic voyage (Berlin, 1871-'2).

**KOLDING**, a town of Jutland, Denmark, on the Koldingfiord (a large bay of the Little Belt), and on the railway from Flensburg to Fridericia, about 10 m. W. S. W. of the latter town; pop. in 1870, 5,400. It contains the fine remains of Koldinghuus, a castle built in the 13th century as a royal residence, and burned in 1808. Here the Schleswig-Holstein troops defeated the Danes, and stormed the town, April 23, 1849. About 7 m. from Kolding is the hill of Samlingsbanke, formerly included in Schleswig, where immense meetings were held prior to 1848 to protest against the separation from Denmark. The obelisk on this spot was pulled down by the Germans in 1864; but it was restored by the Danes, who by the boundary treaty retained possession of the locality.

**KOLIN**, or **Kollin**, a town of Bohemia, on the Elbe, 35 m. E. of Prague, on the railway from Vienna; pop. in 1870, 9,460. It consists of the city proper, which is surrounded by a wall, and four suburbs. It has a Gothic church, an old castle with fine grounds, a convent founded in 1666, a council house, and several factories. An obelisk was erected here in 1842 in honor of a victory gained June 18, 1757, by the Austrians over Frederick the Great. An inn is still in existence which was in the centre of Frederick's position, and from the windows of which he commanded his army.

**KOLLAR, Jan**, a Slavic scholar and poet, born in N. W. Hungary in 1793, died in Vienna, Jan. 29, 1852. He studied at Presburg and Jena, took orders, and in 1819 became preacher to an evangelical congregation at Pesth. In 1849 he was made professor of archæology in the university of Vienna. Being a Slovak by birth, he became a champion of the national regeneration of his race, and the most zealous, if not the first, advocate of Panslavism, or of a union, literary and political, of all Slavic tribes. He developed this tendency in poetical works, written mostly in the Czech language, as well as in disquisitions on the antiquities of the Slavs. Among the former are his *Bázně* ("Poems," 1821), *Slavý dcera* ("The Daughter of Glory"), his most celebrated work, and *Narodnie spievanky* (a collection of Slovak "Popular Songs"); among the latter, *Rozprawy o imenach* ("Treatises on the Names" of the ancient Slavs), *Slava bohyni* ("Goddess Slava"), "On the Literary Relation of the Slavic Tribes and Dialects" (in German), *Cesto-*

*pis* ("A Journey" for antiquarian purposes to northern Italy), and "Ancient Slavic Italy," a work in German, which was published after his death (Vienna, 1853). A complete edition of his *Spisy* ("Writings") was published in Prague (4 vols., 1860-'65).

**KÖLLIKER, Rudolf Albert**, a German physiologist and microscopist, born in Zürich, July 6, 1817. He studied at the gymnasium and university of his native town till 1839, when he went to Rome and soon after to Berlin. In the last named place he began the important microscopic investigations that first gave him his fame as a physiologist. His attention had first been directed to this branch of study while on a visit to the island of Föhr, off the coast of Schleswig, in 1840, and from that time he devoted himself almost exclusively to it. In 1842 he was appointed assistant to Henle at Zürich, and in 1845 adjunct professor of physiology and comparative anatomy. In 1847 he became professor of the same branches at Würzburg, and in 1849 of anatomy there. He has published *Verzeichniss der Phanerogamen des Cantons Zürich* (Zürich, 1839); *Beiträge zur Kenntniss der Geschlechtsverhältnisse und der Samenflüssigkeit wirbelloser Thiere* (Berlin, 1841); *De prima Insectorum Genesi* (Zürich, 1842); *Entwicklung der Cephalopoden* (1844); *Microscopische Anatomie* (2 vols., Leipsic, 1850-'54); *Handbuch der Gewebelehre* (1852; 5th ed., 1867); *Die Entwicklung des Menschen* (1861); and *Icones Histologicæ* (1864). He has been a frequent contributor to scientific periodicals, and was one of the founders of the medico-physical society of Würzburg. He ranks among the greatest histologists; and his works, the chief of which have been translated into English, belong to the highest authorities in anatomical science.

**KOLOMNA**, a town of Russia, in the government and 63 m. S. E. of the city of Moscow, near the confluence of the Moskva with the Oka, and on the great central railway; pop. in 1867, 19,890. It has an old citadel, a flourishing industry, and an important trade in provisions. In 1237 the Russians suffered here a crushing defeat by the Mongolians under Batu Khan.

**KOLOSSES**, a name applied by the Russians to a family of Indian tribes on the N. W. coast of America, extending from lat. 54° 40' to the Atna or Copper river, and comprising the Hydás, Hennegas, Tongas, Stikeens, Kakes, Koas, Kutzns, Awks, Sundowns, Takos, Chilkahs, Hoodsuahoos, Hunnas, and Sitkas. Each tribe is divided into clans, like those in some of the eastern nations, and named the Bear, Eagle, Crow, Whale, and Wolf; and none can intermarry in his own clan. Descent is in the female line. They are a shrewd, bold, perfidious people, evincing considerable ingenuity and skill. They are unprepossessing in appearance, paint their faces, and wear a pin thrust through the lower lip. Their houses are of planks, set upright and roofed with bark,

often 40 ft. wide, 60 deep, and 20 high, with sleeping apartments arranged at the sides. Their canoes are dugouts, 45 ft. long, ornamented with carvings, and there are generally curiously carved posts in front of the houses. Their *baidarkas*, or skin boats, are inferior to those of the Esquimaux. They burn the dead, preserving their ashes in wooden boxes or tombs, curiously decorated. The Koloshes were visited by Behring in 1741, but they captured and destroyed two of his boats with their crews. During the absence of Baranov, the founder of Sitka, from that post in 1800, the Koloshes attacked it and murdered most of the garrison; but Baranov, aided by Krusenstern's fleet, punished them. They continued hostile, and Sitka required a palisade. Their numbers are estimated at about 12,000.

**KOMORN.** See COMORN.

**KONG**, a mountain range of W. Africa, running E. and W. nearly parallel with the coast, on the N. frontier of Upper Guinea, and terminating on the Atlantic in a number of promontories, the principal of which are Capes Verga and Sierra Leone. Its E. termination is not defined. Du Chaillu extends the name to the mountains which, connecting with those just described near the river Niger, extend southward, in a direction generally parallel to the coast of Lower Guinea, and send off several branches toward the sea. One of these ramifications, the Serra do Cristal, extends from

near Fernando Po island to the river Muni in lat. 1° N., and then returning inland rejoins the main range. Further inland, according to Du Chaillu, another offset called the Nkoomoo-Nabooalee mountains runs E. and W. The Kong mountains are very imperfectly known. The W. division does not exceed 2,500 ft. in average height, but in some places is believed to reach the limit of perpetual snow. Granite, marble, and limestone are the prevailing rocks.

**KONGSBERG**, a town of Norway, in the province and 45 m. S. W. of the city of Christiania, at the foot of the Jonsknuden mountain, and near the Larbröfos waterfall, on the Laagen river; pop. about 5,000. It contains a handsome church, and is renowned for its silver mines, the only ones in Norway. They were discovered in 1623, and are worked by the government, which has established here the mint and mining department, powder mills, and smelting works for manufacturing cobalt and reducing and refining the silver ore. The annual yield of silver exceeds 30,000 lbs. A specimen of native silver found in the principal mine, which is 180 fathoms deep, measuring 6 ft. long, 2 ft. broad, and 8 in. thick, is in the Copenhagen museum; and other enormous masses have been found at various times.

**KONIEH**, or *Koniah* (anc. *Iconium*), a city of Asia Minor, capital of the vilayet of its name, about 280 m. S. E. of Constantinople; pop. about 40,000. The stout walls which surround

Koniah.

it were built from the ruins of ancient Iconium by the Seljuk sovereigns, and display some interesting Greek inscriptions and other relics, which were so arranged in the mason work as to remain visible. Of more than 100 mosques which the city contains, 12 are large, and two are much admired for their magnificence. It has also several *medreses* or colleges, and the tomb of Mevlevi Jelal ed-Din, a Mussulman saint much revered throughout Turkey and

the founder of the Mevlevi or whirling dervishes. This tomb is surmounted by a dome resting upon a cylindrical tower of a bright green color, and is an object of pilgrimage. Beyond the walls are suburbs as populous as the town itself. There are extensive gardens, and the surrounding country is in a high state of cultivation, supplying grain and flax in abundance. Like all Turkish towns renowned for superior sanctity, Koniah is full of der-

vishes, who subsist on alms. The inhabitants are principally engaged in the manufacture of carpets, and of blue and yellow leather. They carry on a lively trade with Smyrna.—The ancient Iconium, which is mentioned by Xenophon, Cicero, and Strabo, and in the history of the apostles, was the capital of Lycaonia, but rose to importance only after the taking of Nicæa by the crusaders. The Seljuk sovereigns of Roum made the town their capital in the latter part of the 11th century; Frederick Barbarossa assaulted it in 1190; the sons of Genghis Khan subsequently became masters of it; and Bajazet II. made it the capital of Caramania in 1486. Ibrahim Pasha won here a decisive victory over the Turks, Dec. 30, 1832.

**KÖNIGGRÄTZ** (Boh. *Hradec Králové*), a fortified town of Bohemia, at the junction of the Adler and the upper Elbe, 65 m. E. by N. of Prague; pop. in 1870, 5,515. It is the capital of a large circle, has four suburbs, and is the seat of a bishopric. It contains an old palace and a fine cathedral, and musical instruments, gloves, wax candles, and other articles are manufactured. It is famous for the victory achieved in its vicinity, July 3, 1866, by the Prussians over the Austrians, generally known as the battle of Sadowa. (See SADOWA.)

**KÖNIGINHOF** (Boh. *Kralodvor*), a town of Bohemia, on the Elbe, 62 m. N. E. of Prague; pop. in 1870, 6,222. In the spire of the parish church the *Rukopis Kralodvorsky*. ("Manuscript of Königinhof"), a collection of epic and lyric Bohemian poems, was discovered in 1817 by Hanka. Many critics doubt its genuineness, while others, including Palacky, assign its origin to the end of the 13th or the beginning of the 14th century.

**KÖNIGSBERG**, a fortified city of Prussia, capital of an administrative district and circle of the same name, in the province of East Prussia, on the river Pregel, about 5 m. from its entrance into the Frisches Haff, an inlet of the Baltic, 335 m. N. E. of Berlin, and 75 m. E. N. E. of Dantzic; pop. in 1871, 112,123. The city is subdivided into the Altstadt on the west, the Lößenicht on the east, both lying high, and the Kneiphof, a low island on the Pregel, which is crossed by seven stone bridges and an iron railway bridge. There are also four suburbs. A railway connects Königsberg with Berlin on the one hand and with St. Petersburg on the other. Its port is Pillau, 20 m.

W., on the Baltic, at the entrance of the Frisches Haff. There is a considerable trade, mostly with Great Britain; the exports are breadstuffs, flax, hemp, oil seeds, bones, timber, &c.; the imports, colonial produce, iron, coal, cotton, and raw sugars. The chief manufactures

Königsberg Cathedral.

are textile fabrics, soap, leather, and starch. Sugar and silver refining, brewing, and distilling are carried on. Much amber was formerly found here, but the production has fallen off. The sturgeon fishery is important. The entrances and clearances in 1871 amounted to 3,276 vessels of 563,046 tons. The navigation of the river averages an annual entrance and clearance of 8,900 vessels. The city has 21 churches, a synagogue, an exchange, a city hall, a theatre, two theological seminaries, three gymnasia, schools of all branches of fine arts, science, industry, and commerce, six hospitals, deaf and dumb and blind asylums, and many other charitable institutions. The most imposing public building is the cathedral, a Gothic structure, in which the religious service of the Reformed church was introduced in 1523. In a porch outside of the cathedral rest the remains of Kant, who was a native of Königsberg. The Schloss, or palace, now used for government offices, was once the residence of the grand masters of the Teutonic order, by whom the city was founded in 1255-'7, and also of the first dukes of Prussia. The university, founded in 1544 by Duke Albert, and hence called the Albertine university, was in a prosperous condition in the 16th century, when the attendance of students, now only 600, was nearly 2,000. Since the castle and city libraries were placed in the university, it has a library of 220,000 volumes, numerous manuscripts, and valuable collections of incunabula and engravings. It also contains five clinical schools, a botanic garden, and a celebrated observatory, which was under the di-

rection of Bessel until his death in 1846, and contains one of the finest meridian globes in the world, prepared by Reichenbach. The first rector of the university was Georg Sabinus, the son-in-law of Melancthon. It became celebrated as the place where the philosophy of Kant was first propounded. Besides Kant, the names of Hamann, Hippel, Herder, Fichte, Herbart, and Jacobi are associated with the institution. The new university buildings were completed in 1862. Königsberg, which had been fortified by detached forts since 1843, has now been made one of the strongest fortresses of Prussia.

**KÖNIGSHÜTTE**, a town of Prussia, in the province of Silesia, formed in 1869 by the consolidation of the former domain of Königshütte, which in 1864 had only 1,144 inhabitants, and several adjacent domains, 100 m. S. E. of Breslau; pop. in 1871, 19,546. It is one of the chief centres of the mining industry in the eastern portion of Prussia, and is the seat of a mining board which is subordinate to the supreme mining board of Breslau. The produce of raw iron amounted in 1870 to about 1,000,000 cwt. About 3,000 workmen are employed in the government coal mines, which produce about 16,000,000 cwt. annually.

**KÖNIGSMARK**. I. **Philip Christopher**, count of, a Swedish adventurer, born about 1650, killed July 1, 1694. While a colonel in the Swedish service he went to the court of Hanover in 1692. The prince elector (subsequently George I. of England) had married his cousin Sophia Dorothea, daughter of the duke of Celle, a princess celebrated for her beauty. Alienated from her husband by his gloomy and jealous character, Sophia was attracted by Königsmark, whom she had known when young, and availed herself of his offer to aid her to fly from the court of Hanover, where she was most unkindly treated, to France. Their interviews were watched, and one evening on quitting her he was assassinated by order of the elector. Dr. Doran, in his "Lives of the Queens of the House of Hanover," endeavors to exonerate the princess from a guilty love for the gallant Swede; but the fact of its existence is established by the letters which she exchanged with him, published by Palmblad (Leipsic, 1847). II. **Maria Aurora**, sister of the preceding, born probably in Stade about 1670, died in Quedlinburg, Feb. 16, 1728. She was an orphan, and went while yet a young girl to Dresden, hoping to recover by royal intervention her property, which was kept from her by Hamburg bankers. Augustus the Strong, the elector of Saxony and future king of Poland, made her his mistress, and by him she became mother of the celebrated Maurice of Saxony (Marshal Saxe). She was considered one of the most beautiful and accomplished women of her age. The last years of her life she spent in retirement as prioress of Quedlinburg. She left in manuscript a number of dramatic pieces and poems. The memorable incidents of her

life were published by Cramer, *Denkwürdigkeiten der Gräfin Königsmark* (2 vols., Leipsic, 1836), and a biography was written by Palmblad (6 vols., Leipsic, 1848-'53).

**KÖNIGSTEIN**, a town of Saxony, at the confluence of the Biela with the Elbe, 18 m. S. E. of Dresden; pop. about 3,000. It is noted for its picturesque situation opposite the fortress of Königstein, a formidable stronghold upon a mass of rock 800 ft. high, on the left bank of the Elbe. The fortress is accessible only through a strongly defended passage on the northwest. A well, cut in the solid rock to a depth of 600 ft., supplies the garrison with water, and casemates, likewise excavated, contain storehouses for provisions. By virtue of the military convention of Feb. 7, 1867, it was partly garrisoned by Prussians. According to the German constitution of 1871 the commander is appointed by the emperor, though the garrison now consists exclusively of Saxon soldiers.

**KOODOO**. See ANTELOPE.

**KOOMASSIE**, or **Coomassie**, a town of W. Africa, capital of Ashantee, about 105 m. N. by W. of Cape Coast Castle; pop. (previous to its destruction in 1874) about 15,000. Its site is on the declivity of a hill of ironstone, around whose base flows the Suabin, a sluggish stream, which in the rainy season transforms the neighborhood into a swamp. Beyond it a dense forest extends to the coast on the south and several days' journey to the north. The town occupied a parallelogram about a mile in length by half a mile in breadth, and was laid out in squares, with broad, straight, and well kept streets. The principal ones, which were shaded with fine banian trees, were bordered with picturesque houses and verandas in front and projecting roofs, each having a large public room opening directly on the street, and smaller private rooms behind. The walls were of wattle work plastered with clay, the lower part colored with red ochre, the upper with white clay and ornamented with arabesque designs. In the rear of these houses, which were the residences of the chief men, were other buildings arranged in quadrangles, the homes of the slaves and retainers. N. of the road leading to Juabin was the king's palace, a collection of buildings and courtyards covering an area of five acres and surrounded by a palisade of bamboo 8 ft. high. It served at once as the royal abode, harem, mausoleum, and military magazine. The king's private residence was a strongly built edifice of two stories, of quarried stone plastered with lime mortar, enclosing a quadrangle 24 by 20 ft. It had a flat roof, and was fitted with battlements and loopholes for musketry. Within the town and extending nearly into its centre was the grove into which were thrown the bodies of the victims of the annual sacrifices, numbering frequently hundreds at a time.—Koomassie had little trade and no manufactures of consequence, it being chiefly the place of residence of the sovereign and the nobles. It was founded about 1720.

On Feb. 4, 1874, it was captured by the British under Gen. Sir Garnet Wolseley, and on the morning of the 6th the town was destroyed by fire, and the palace blown up; but it was soon after reoccupied by the natives, who immediately began to rebuild it. Within a few months

indolent, and indisposed to labor or to adopt civilized ideas. They live on fish, camash and other roots, grain, fruit, and berries, and are very poor. They roamed chiefly on the head waters of the Clark and McGilvray rivers, seldom hunted buffalo, but took elk, deer,

The King's Palace in Koomassie.

after its capture several volumes were published in London descriptive of the campaign, chiefly by newspaper correspondents: "The March to Coomassie," by G. A. Henty of the London "Standard;" "Coomassie and Magdala," by Henry M. Stanley of the "New York Herald," &c. (See GOLD COAST.)

**KOOR.** See KUR.

**KOORDISTAN.** See KURDISTAN.

**KOORILE ISLANDS.** See KURILE ISLANDS.

**KOOSO, Kosso, or Cusso,** the Abyssinian name of the flowers and tops of *Brayera anthelmintica*, a small tree of the order *rosaceæ*, growing on the high table land of Abyssinia. These are brought to Europe in a dry, compressed, greenish yellow mass. This drug has been long used by the natives of the country whence it comes as a remedy for tapeworm, and it has been introduced into European practice. It appears to act principally as a poison to the parasite, though it sometimes produces nausea or even vomiting and diarrhœa. It is given in the form of powder mixed with warm water in the dose of half an ounce for an adult. The active principle has not been determined with certainty, though the drug contains among other substances a resin, a volatile oil, a crystallizable acid, and extractive matter.

**KOOTENAYS,** a tribe of Indians in the northwest of the United States, with some bands in British Columbia. They form a distinct family, as shown by their language, from the Flatheads, with whom they have long been allied. They comprise the Kootenays and the Flatbows, and are known through the country as the Skalzi. They are gentle, amiable, honest, but cowardly,

Rocky mountain sheep, birds, and fish. They welcomed Father De Smet, and built a large chapel on the Tobacco Plain, but from their thriftless life have made little progress, except a few under Eneas, who reside somewhat permanently on Flathead lake. In 1872 there were 320 Kootenays in Montana, with the Flatheads and Pend d'Oreilles, sharing their vicissitudes and removal to Jocko; 400 in Idaho, 400 in British Columbia, and some in Washington territory. Those in Idaho, by executive order of June 14, 1867, were removed to a reservation of 250,000 acres set apart for them.

**KOPISCH, August,** a German poet and painter, born in Breslau, May 26, 1799, died in Berlin, Feb. 3, 1853. While in Italy, in his early life, he was one of the discoverers of the blue grotto in the island of Capri. Among his most popular poems are the "Song of Noah" and other witty and humorous pieces. He also translated Dante. His *Gesammelte Werke*, edited by K. Bötticher, appeared in Berlin in 1856, in 5 vols.

**KOPITAR, Bartholomäus,** a Slavic philologist, born at Repnje, Carniola, Aug. 23, 1780, died in Vienna, Aug. 11, 1844. He studied at Laybach, and became a private tutor. In 1807 he went to Vienna, where he found employment in the imperial library, of which he became first director shortly before his death, with the title of councillor. He was prominent among the scholars who have brought light into the more obscure parts of Slavic ethnology, philology, and literature. His works include *Grammatik der slawischen Sprache in Krain*, &c. (Laybach, 1808); *Glagolita Clozianus* (Vienna, 1836); and posthumous minor essays on Slavic philology, ethnology, history, and jurisprudence, edited by Miklosich (Vienna, 1857).

**KOPP, Joseph Eutych,** a Swiss historian, born at Beromünster, Lucerne, in 1793, died Oct. 25, 1866. He was professor of Greek at Lucerne from 1819 to 1841, and afterward a member of the council of state and president of the board of education till 1845, when he was removed on account of his opposition to the restoration of the Jesuits. He has been called the Niebuhr of Switzerland. In his *Urkunden zur*

*Beleuchtung der Geschichte der eidgenössischen Bünde* (2 vols., Lucerne, 1835-'51), he disproves the authenticity of the story of William Tell, and questions the propriety of the Swiss rising against the emperor Albert. His principal work, *Geschichte der eidgenössischen Bünde* (5 vols., Leipsic, 1845-'62), was continued after his death by Alois Lütolf and Arnold Busson (Berlin, 1872).

**KOPPARBERG** (formerly FAHLUN), a län or district of Sweden, in the province of Svealand, bounded N. by Jemtland, E. by Gefleborg, S. and S. W. by Westmanland, Örebro, and Wermland, and W. by Norway; area, 11,230 sq. m.; pop. in 1872, 178,890. It is very mountainous, and contains several valleys and branches of the river Dal and its tributaries. Rye, barley, and oats thrive chiefly in the southeast. Cattle are extensively reared, and the lakes and rivers abound in fish. But the prosperity of the district is mainly derived from its great wealth of timber and minerals. The copper mines are the largest in Sweden, and porphyry is converted here into many fine articles, and ironware is made in large quantities. The inhabitants are Dalecarlians, and their district was long known as a province under the name of Dalecarlia. Capital, Fahlun.

**KÖPPEN, Friedrich**, a German philosopher, born in Lübeck, April 21, 1775, died in Erlangen, Sept. 5, 1858. He studied theology in Jena, but he attended also the lectures of Reinhold and Fichte, and after spending a year in Göttingen he published his first work, *Abhandlung über Offenbarung, in Bezug auf Kant'sche und Fichte'sche Philosophie* (Lübeck, 1797), which passed through several editions. Next appeared his polemical disquisition on Schelling's philosophical system, entitled *Schelling's Lehre, oder das Ganze der Philosophie des absoluten Nichts* (Hamburg, 1803). He adopted in general the opinions of Jacobi, and his subsequent works, *Darstellung des Wesens der Philosophie* (1810), *Philosophie des Christenthums* (1813-'15), *Politik nach Platonischen Grundsätzen* (1818), and *Rechtslehre nach Platonischen Grundsätzen* (1819), attempt to demonstrate the compatibility of critical philosophy and Christianity, basing faith and morality on personal consciousness. He preached in Bremen from 1804 to 1807, and was afterward professor in the university of Landshut until its dissolution in 1826, when he accepted a chair in Erlangen. In 1840 he published anonymously a *Philosophie der Philosophie*.

**KÖPPEN, Peter von**, a Russian archæologist, born in Kharkov, Feb. 19, 1793, died at Karabagh, Crimea, June 4, 1864. He studied in the university of Kharkov, and devoted himself at once to researches on the history, ethnology, and material condition of the Russian empire. The first fruit of his labors was the *Uebersicht der Quellen einer Literaturgeschichte Russlands* (St. Petersburg, 1818), which was followed in 1822 by a collection of Slavo-Russian antiquities and facsimiles of manuscripts. His *Nord-*

*gestade des Pontus* (Vienna, 1823), *Die dreigestaltete Hekate und ihre Rolle in den Mysterien* (1823), and his articles in German periodicals on the antiquities and arts of Russia, furnished valuable materials for archæological researches. In 1827 appeared his *Materialien zur Culturgeschichte Russlands*. At this time he entered the service of the government, investigated the productiveness and hydrography of the provinces of southern Russia, and published several works on the results of his researches. His numerous travels through the empire gave him a thorough acquaintance with the various elements of the population, and he published in the following years several highly esteemed ethnological works, among them *Ueber die Nationalität der Bewohner verschiedener Gouvernements, Ueber die Vertheilung einzelner Völkerstämme*, and *Ueber die Deutschen im Petersburger Gouvernement*. The final result of these labors was a large ethnological chart of European Russia, published in 1851. His last important work is an exhaustive treatise on the ninth census, *Deviataya reviza* (St. Petersburg, 1857). He spent his last years on the estate of Karabagh, presented to him by the emperor.

**KORAN**, or **Alkoran** (Arab. *qur'ân*, the reading, or that which ought to be read; hence, "the book"), the sacred book of the Mohammedans. It is their chief authority not only in matters of faith, but in all others, whether political, military, or ethical. Among its numerous designations, *Furqân*, that which distinguishes (between good and evil), *Al-Kitâb*, the book, *Al-Moshaf*, the volume, and *Al-D'îkr*, the admonisher, are of most frequent occurrence. It consists of 114 *surâs* or chapters, each bearing a title which either affords a key to the contents, or is merely a word contained in it used as a heading. Thus the second sura is headed "Cow," which word occurs only in the 63d verse, where it is said that Moses commanded the Israelites to sacrifice a cow. Twenty-nine suras commence with letters of the alphabet believed to bear a mystical signification. With the exception of the ninth, each sura begins with the formula *Bism-illâhi er-rahmani er-rahîmî*, "In the name of the God of pity and mercy." The first sura, or the sentences that open the Koran, is the model prayer of the Mohammedans, and bears several titles, such as the *Fatihah* (exordium), "The Mother of the Koran," "The Pearl," "The All-sufficient." The words are these: "Praise be to God, the lord of the world, the pitying and merciful, the sovereign judge in the day of retribution! Thou art he whom we adore! Thou art he whom we implore to help us! Lead us in the straight way; in the way which thou hast strewn with benefits, and which leadeth not into error!" The other suras are arranged almost entirely according to the number of verses they contain, the longest being the second, and the shortest the last. The suras are divided into *âyats* or verses. For the purpose of recitation in the mosques, the Koran is

divided into 30 *adzds* or parts, and 60 *asabs* or sections, each of four portions. As Mohammed continued his revelations during 23 years amid many vicissitudes, there is often but little connection between the suras, or the verses of each sura. According to the various occasions on which they were delivered, some portions contain dogmas, others conversations with God, rules of conduct, arguments in defence of doctrines, threats and promises, &c. It is generally believed that Mohammed was wholly unacquainted with writing, and dictated the passages of the Koran to amanuenses. The arrangement of the chapters and verses was made, according to the tradition of Ibn Abbas, during the lifetime of the prophet, and many Mohammedans believe that the other divisions were also made under his supervision. The style of the Koran is rather rhetorical than poetic, and its contents are to a large extent drawn from the ancient traditions of the Arabs, the Hebrew Bible, the Christian New Testament, the Talmud and Midrash of the later Jews, the tenets of the Magi, and many apocryphal writings, the so-called *protevangelia*. These materials, of course, suffered many changes and perversions.—The Mohammedans believe that the revelations delivered to Mohammed from time to time were of two kinds: first, those wherein were given the words delivered by the prophet; and secondly, those in which was given the sense of what he afterward communicated in his own words. Mohammed's revelation, according to the Koran, resulted from his being transported in a vision from Mecca to Jerusalem, and thence to heaven, where he "really beheld some of the greatest signs of his Lord." This is all that the Mohammedan is bound to believe concerning the revelation of the Koran; but the *hadises*, or traditions, which contain long and wondrous details of this vision, are also believed in by many; and these consider Mohammed's journey to heaven as real, or as having been performed by the prophet in the body. These traditions are known as "the splitting or opening of the chest," and the "night journey." Leaving the minor variations of the story unnoticed, the *hadises* narrate that on the night of the celestial journey the roof of Mohammed's house in the city of Mecca was suddenly removed; the angel Gabriel descended and touched the heels of the prophet, who was lying on his back; when he awoke, the angel cut open his breast to below his navel; then a white animal, somewhat between a mule and an ass, called *borak*, was brought, and they rode to Jerusalem, where they performed certain rites; they ascended thereupon through the heavens, meeting Adam in the first, Jesus and John in the second, Joseph in the third, Aaron in the fourth, Edres in the fifth, Moses in the sixth, and Abraham in the seventh; then they were taken up to the "boundary tree," and then to God, who "revealed to me what he revealed." After they had passed

from that place a heavenly herald proclaimed aloud, "I have established my commandments and made them easy to my servants." The tradition related by Omar represents Mohammed as declaring that when he returned from the heavens he alighted in the house of Khadijah, his wife, so soon that she had not even turned herself from one side to the other. The traditions that the Koran was brought down from heaven by the angel Gabriel, that it was written on the skin of the ram which Abraham sacrificed instead of his son Isaac, that it was bound in silk and ornamented with gold and pearls, and similar ones, are believed in by very few, and form no part of the Mohammedan religion.—The compilation of the fragments of the Koran was not undertaken until after the death of Mohammed. Portions of it were scattered among his disciples, either written on parchment, bones, stones, and palm leaves, or merely committed to memory; and when in the ensuing contests with the rebellious people of Yemamah many of the Moslems were slain who knew large portions of the Koran by heart, it was feared that much of it might be lost, and Omar caused the caliph Abu Bekr to collect all he could. Said ibn Said was intrusted with this work, and the copy of his compilation remained in the possession of Abu Bekr. At the death of the latter the Koran was handed to Omar, who bequeathed it to his daughter Hafsa, a widow of the prophet. The Moslems continued to read and recite their Koran as they could until about ten years later, when the caliph Othman employed the same Said ibn Said and several other Koreishites to write a number of copies of Hafsa's Koran, revising it, and making additions to it wherever needed. These copies were to constitute the final authority for the reading of the text, and in order to avoid all further disputes Othman ordered the destruction of all other copies except Hafsa's; but hers was subsequently also destroyed by the caliph of Medina. While thus a great injury was inflicted upon theological criticism, it was, politically speaking, a wise procedure to reduce the Koran, which had to serve also as a civil and criminal code, to a single reading. This revised text is the Koran which has descended to our day.—Criticism has been greatly concerned in discovering wherein this last revision consisted. A careful reading of the present Koran shows that many passages are mere fragments, which were added without careful selection to other portions of it. It is not believed that the revisers excluded anything that belonged to the Koran except what was not sufficiently authenticated as forming a part of it. It is also not likely that they attempted a systematic arrangement of the suras, because each of them treats of a great number of subjects. A chronological order was also impossible, because accurate accounts of the older pieces were already wanting, and also because fragments of different periods had already been placed in permanent

connection with other portions of the Koran. For a proper understanding of the Koran a restoration to chronological order would be necessary, and this is apparently impossible. The Moslem traditions in regard to the time when Mohammed revealed a particular sura have to be admitted with great caution; and besides being frequently contradictory among themselves, they throw but little light on the suras which were given out before Mohammed's flight to Medina. The difference of the position which the prophet held before and after this event could not fail to become apparent in the general character of his sayings. The suras of the earlier epoch may be recognized by their intense enthusiasm; they are generally short: Mohammed has visions of angels, of the day of retribution, and of God, and his animadversions on his enemies are replete with passion and anger. The later suras still contain some of the old fire, but their general tenor is calm and prosaic, and most of them seem to be little else than general army orders and portions of a civil and criminal code. A necessary consequence of the fragmentary composition of the Koran was frequent contradictions. Mohammedan divines have, however, surmounted the difficulties arising from these. When there are two contradictory laws on one and the same subject, they explain the one as being *munsukh*, and the other as *nasikh*. They say that such commandments were given under different circumstances, and that when one of the circumstances was wanting the commandment relating thereto was void, or *munsukh*; and that then the commandment became in force, or *nasikh*, which was intended to meet the altered circumstances. (For theological and sectarian interpretations of the text, see MOHAMMEDANISM. For the dialect in which the Koran is written, and the native literature to which it has given rise, see ARABIC LANGUAGE AND LITERATURE.)—It is common in the Orient to ascribe every ancient manuscript of the Koran to the time and even the hand of one of the first caliphs, and several libraries boast of possessing the earliest copy written by Othman himself, while it is very doubtful whether he was personally engaged in the revision of the text. Thus it is said that there are manuscript Korans of the age of Othman and Ali at Constantinople, Damascus, and Cairo. It is believed that some portions of it now preserved at Copenhagen date from the first century of the hegira. Printed editions have been prepared by Pagninus Brixiensis (Venice, 1509 or 1518, burnt by order of Clement VIII.); Hinkelmann (Hamburg, 1694), the oldest now known; Mollah Usman Ismael (St. Petersburg, 1787), with valuable marginal notes; and G. Flügel (Leipzig, 1834), revised by Red-slob (1837, 1842, and 1858). The following are editions of the original with versions: *Muzih-i Koran*, with a Hindustani interlinear version and notes, by Maulana Shah Abdel Ka-

der, Calcutta, 1829-'32; with an English version, Serampore, 1833, and Persian commentaries, Calcutta, 1837. There are English translations by Alexander Ross (London, 1649; new ed., 1871), G. Sale (2 vols., London, 1734), and Rodwell (London, 1861). The history of the Koran is given by Nöldeke, *Geschichte des Qurâns* (Göttingen, 1860), and by Sprenger in his valuable work, *Das Leben und die Lehre des Mohammed* (3 vols., Berlin, 1868). The essays "On the Holy Koran," "On the Mohammedan Traditions," and "On the Mohammedan Theological Literature," by Syed Ahmed Khan Bahadoor (London, 1870), are interesting as the opinions of a learned Mussulman.

**KORAT**, a neutral territory of Asia, governed by an independent prince, on the boundaries of Siam and Cambodia; pop. about 60,000. The people are chiefly engaged in making sugar and in copper mining. The capital, of the same name, 138 m. N. E. of Bangkok, has about 7,000 inhabitants. It is on an elevated plateau, accessible only by ascending a thickly wooded steep, called Dorg Phaja Fai, "forest of the king of fire," on account of its gloomy aspect and foul atmosphere.

**KORDOFAN**, a country of E. Africa, subject to the khedive of Egypt, lying between lat. 12° 30' and 15° 30' N., and lon. 29° and 32° E., bounded N. by Nubia and S. by the Deir mountains, and separated by strips of mostly desert land from the White Nile on the E. and Darfoor on the W.; pop. estimated at 400,000. The surface is in general level, but in the southwest and extreme north it is rather mountainous. There are no permanent rivers, but several small lakes exist in different parts of the country. The climate is very unhealthy in the rainy season, and in the dry intolerably hot; hurricanes are frequent. The soil is naturally fertile. In the wet season the earth is covered with a luxuriant vegetation, but during the drought everything is burned up. The population consists of negroes, Arabs, and emigrants from Dongola. This country was for a long period tributary to the empire of Sennaar; it was taken in the latter half of the 18th century by the king of Darfoor, and was conquered by Mehemet Ali about 1820, who was confirmed in the possession of it by a firman issued by the sultan, Feb. 13, 1841. Slavery was abolished there in 1857. Capital, Obeid, or El Obeid.

**KORNEGALLE**, a town of Ceylon, 55 m. N. E. of Colombo, noted for its beautiful situation within the shade of a stupendous rock, for the remains of a city, once one of the capitals of Ceylon, and for an ancient temple where the footprint of Buddha is hollowed in the rock, in the same manner as on Adam's Peak, and to which pilgrims resort from the most distant part of the island. The place is surrounded by dense forests, and every cottage of the modern town has a garden.

**KÖRNER**, Karl Theodor, a German poet, born in Dresden, Sept. 23, 1791, killed near Rosenberg, Mecklenburg, Aug. 26, 1813. His father

intended him for scientific pursuits, and sent him to the mining academy of Freiberg; but he early displayed a strong taste for poetry, inspired by Schiller, who was an intimate friend of his father, and in 1810 published his first volume of poems under the title of *Knospen*, or "Buds." Having studied for a short time at the university of Leipsic, he went to Berlin, and soon after to Vienna, where he wrote his dramas *Toni* and *Hedwig*, and the tragedies *Zriny* and *Rosamunda*, and was appointed poet to the *Burgtheater*. During the German "war of freedom" against Napoleon Körner joined the "black huntsmen" of Lützow (March, 1813), with whom he entered Saxony. His bravery soon gave him a reputation and the rank of lieutenant. It was during this exciting life that he wrote those patriotic songs which, set to music by Weber, have since become so well known. During the night of Aug. 25, 1813, while waiting in a wood to attack a small detachment of French troops, he wrote his celebrated *Schwertlied*, or "Sword Song." At 7 o'clock on the morning of the 26th Lützow attacked the French, who took refuge in the wood while Körner pursued them. Between the fires of his own men and the enemy he was mortally wounded. His corpse was crowned with oak leaves and buried beneath an old oak, near the village of Wöbelin. Near the spot is now placed a fine monument of iron, designed by the architect Thormayer, which has become a place of great resort for visitors. A selection of his battle songs was prepared by his father and published under the title of *Leier und Schwert* (Berlin, 1814). His complete works were published by the direction of his mother, and edited by Streckfuss (1 vol., Berlin, 1834; 4 vols., 1838). His "Life, written by his Father, with his Selections from his Poems, Tales, and Dramas," translated from the German by G. F. Richardson, appeared in London in 1845.

**KÖRÖS**, or **Nagy-Körös**, a town of Hungary, in the county and 42 m. S. E. of the city of Pesth, on the railway to Szegedin; pop. in 1870, 20,091. It has a gymnasium. The inhabitants are mostly Magyars, and chiefly engaged in raising stock and in cultivating wine and corn.

**KORTEZT**, or **Cortitz**, an island of Russia, in the Dnieper river, 165 ft. above its level, in the government and about 40 m. south of the town of Yekaterinoslav. It is surrounded by masses of granite, and was a stronghold of the Cossacks until their removal in 1784, when the island, with its 16 villages, of which the principal one is named Kortetz, was selected by Catharine II. for a settlement of German Mennonites, who are chiefly agriculturists. It has manufactures of cotton and woollen goods.

**KORTÜM**, **Johann Friedrich Christoph**, a German historian, born at Eichhorst, Mecklenburg-Strelitz, Feb. 24, 1788, died in Heidelberg, June 4, 1858. He was successively a teacher in Fellenberg's school at Hofwyl and in other

places, and professor of history at Basel, Bern, and Heidelberg. His principal works are *Geschichte des Mittelalters* (2 vols., Bern, 1836-'7), *Geschichte Griechenlands* (3 vols., Heidelberg, 1854), and *Geschichte Europas im Uebergange vom Mittelalter zur Neuzeit*, edited by Reichlin-Meldegg (2 vols., Leipsic, 1861).

**KORTÜM**, **Karl Arnold**, a German poet, born at Mühlheim on the Ruhr, July 5, 1745, died in Bochum, Aug. 15, 1824. He was a physician, and is known for his humorous and satirical poetry, including *De Jobsiade*, an epic (3 parts, Münster, 1784; 11th ed., Leipsic, 1865; English translation by the Rev. C. T. Brooks, Philadelphia, 1863).

**KORVEI**, or **Corvey**, a village of Westphalia, Prussia, in the district and 42 m. S. E. of Minden, on the left bank of the Weser; pop. about 600. It is beautifully situated, and has a harbor and an annual fair. It is the residence of Prince Victor of Hohenlohe-Schillingsfürst, upon whom the title of duke of Ratibor and prince of Corvei was conferred in 1840. The church is a fine Gothic building, and the palace contains a large library and a collection of rare illustrated works.—Corvei acquired celebrity through a Benedictine abbey, founded early in the 9th century by the emperor Louis le Débonnaire as a branch of that of Corbie in Picardy, whence the name (*Corbeia Nova*). It was directly under the authority of the pope, and became next to Fulda the greatest missionary centre for the diffusion of Christianity. Among its members were Anscarius, the apostle of the north, Bruno, who became pope as Gregory V., Wittkind, Wibald, and other renowned personages. A copy of Tacitus, with the only manuscript extant of the first six books of the "Annals," was discovered in the extensive library of the abbey in 1514, but was taken away, and is said to have passed into the hands of Pope Leo X., and to have been transferred to Florence. The abbey had a vote in the German diet, and claimed possession of the island of Rügen, which according to tradition had been given to it by the emperor Lothaire. At the end of the 18th century Pius VI. promoted the abbey to a see; and after having belonged to the duchy of Nassau (1803) and the kingdom of Westphalia (1807), it was allotted to Prussia in 1815. The abbey was suppressed by the pope in 1816, while the king of Prussia in 1821 raised the territory belonging to it to a principality, which was bestowed on the landgrave of Hesse-Rheinfels-Rothenburg, and subsequently inherited by Prince Hohenlohe-Schillingsfürst. Among the most renowned intellectual treasures of the former abbey was the *Chronicon Corbeense*, long regarded as a high authority on mediæval history. It was first edited in 1824, but its genuineness has been impugned by Ranke and others. The *Annales Corbeenses*, however, included in vol. iii. of Pertz's *Monumenta Germaniæ Historica*, are regarded as authentic. (See Wigand, *Die Korweischen Geschichtsquellen*, Leipsic, 1841.)

**KOSCIUSKO**, a N. county of Indiana, drained by Tippecanoe river; area, 567 sq. m.; pop. in 1870, 23,531. The surface is undulating and the soil mostly productive. It is diversified with several lakes and prairies. The Pittsburgh, Fort Wayne, and Chicago, and the Cincinnati, Wabash, and Michigan railroads pass through it. The chief productions in 1870 were 523,502 bushels of wheat, 276,820 of Indian corn, 73,591 of oats, 75,755 of potatoes, 86,430 lbs. of wool, 448,364 of butter, and 18,005 tons of hay. There were 7,964 horses, 6,504 milch cows, 7,740 other cattle, 29,909 sheep, and 19,443 swine; 6 manufactories of carriages, 2 of woollen goods, 7 flour mills, and 37 saw mills. Capital, Warsaw.

**KOSCIUSKO, Mount.** See AUSTRALIA, vol. ii, p. 129.

**KOSCIUSZKO, Tadeusz (THADDEUS)**, a Polish patriot, born near Novogrudek, Lithuania, Feb. 12, 1746, died in Solothurn, Switzerland, Oct. 15, 1817. He was descended from a noble Lithuanian family, studied at the military academy of Warsaw, and was sent to the military school at Versailles to complete his studies at the expense of the state. On his return to Poland he rose to the rank of captain, but an unrequited passion for the daughter of the marshal of Lithuania induced him to leave his country. He embarked for America, where he received a commission as an officer of engineers, Oct. 18, 1776, and repaired to his post with the troops under Gates. He planned the encampment and post of the army on the range of hills called Bemis heights, near Saratoga, from which, after two well fought actions, Burgoyne found it impossible to dislodge the Americans. Kosciuszko was subsequently the principal engineer in executing the works at West Point, and became one of the adjutants of Washington, under whom he served with distinction. From Franklin he received the most marked expressions of esteem and commendation. Finally he was made a brigadier general, and was honored with the public thanks of congress, and with the badge of the Cincinnati. At the end of the war he returned to Poland, where he lived several years in retirement. In 1789, when the Polish army was reorganized, he was appointed a major general. He fought gallantly in defence of the constitution of May 3, 1791, under Prince Poniatowski against the Russians, and particularly in the battle of Zielence (June 18, 1792), and in that of Dubienka (July 17), where with but 4,000 men he kept at bay 15,000 Russians, and finally made his retreat without great loss. When King Stanislas submitted to the second partition of Poland, Kosciuszko resigned his commission and retired to Leipsic, where he received from the national assembly the citizenship of France. He was bent, however, on another effort for Poland. A rising of his countrymen was secretly planned, and Kosciuszko elected dictator and general-in-chief. Suddenly appearing at Cracow, March 24, 1794, he issued a manifesto against the Russians, and,

with a hastily collected host, armed mostly with scythes, advanced to meet the enemy. At Raclawice (April 4) he routed with 5,000 men a Russian corps almost doubly strong, and returned in triumph to Cracow. He received reinforcements from some former Polish detachments, and, committing the conduct of government affairs to a national council organized by himself, moved forward in quest of the Russian army. His march was opposed by the king of Prussia at the head of 40,000 men, and Kosciuszko, whose force amounted to but 13,000, was defeated, June 6, 1794, at Szezecociny. Being unable to check the anarchy that existed everywhere in the land, Kosciuszko had laid down the dictatorship and now retired with his army to Warsaw, which city he defended with great success against the beleaguering Prussians and Russians. When the siege was raised, he reorganized his army, and went out to check the progress of the Russian forces under Suvaroff and Fersen, but was routed by their overwhelming numbers at Maciejowice, Oct. 10. Kosciuszko, falling covered with wounds from his horse, was captured by the Russians, and consigned to a prison in St. Petersburg. His imprisonment was rigorously continued during two years, until the death of Catharine, when the emperor Paul gave him his liberty, with many marks of esteem. The czar, on releasing his prisoner, offered him his own sword. "I have no need of a sword," said Kosciuszko; "I have no country to defend." No sooner had he crossed the Russian frontier than he sent back to the czar the patent of his pension, and every testimonial of Russian favor. Henceforth his life was passed in retirement. In 1797 he visited the United States, where he was received with great honor and distinction, and obtained from congress a grant of land, in addition to a pension which he had received since the close of the war. Taking up his abode thereafter in France, he lived chiefly at a country place near Fontainebleau, passing his time in agricultural pursuits. In 1806 Napoleon, about to invade Poland, desired to make use of the patriot; but Kosciuszko, under parole not to fight against Russia, refused to lend himself to his purpose. When the allies approached Paris in 1814, Kosciuszko observed a Polish regiment committing acts of pillage. Rushing forward, he upbraided the officers for their conduct. "Who is he who dares to speak thus?" they exclaimed. "I am Kosciuszko," he replied. The effect of his name upon the soldiers was electric. Throwing down their arms, they prostrated themselves at his feet, and supplicated his pardon. The emperor Alexander, who, in an audience subsequently, held him long in conversation, made him the most flattering promises. Kosciuszko repaired to Vienna, but after the battle of Waterloo he was strangely neglected, and soon left the seat of the great European congress. In 1816 he went to live in Switzer-

land, making his home at Solothurn, whence in the following year he sent a deed of manumission to all the serfs upon his Polish estate. His death was caused by a fall from his horse over a precipice. His remains were removed by the emperor Alexander to the cathedral church of Cracow, where they repose by the side of Poniatowski and Sobieski. Near Cracow there is a mound of earth 150 ft. high, which was raised to his memory by the people, earth being brought from every great battle field of Poland. From a fancied resemblance in shape to this tumulus, the loftiest known mountain in Australia has received the name of Mount Kosciusko.

**KOSEGARTEN**, Johann Gottfried Ludwig, a German orientalist, son of the poet Ludwig Theobul Kosegarten, born in Altenkirchen, Sept. 10, 1792, died in Greifswald, Aug. 18, 1860. He went to Paris in 1812 to study the oriental languages under Chézy and Sylvestre de Sacy. On his return to Germany in 1815 he was appointed to the chair of oriental literature at Greifswald, and in 1817 he accepted the same professorship at Jena, but returned in 1824 to Greifswald. Among his works are an edition of the *Moallaka* of the Arabian poet Amru ben Kethum (Jena, 1819); German translations of the Indian poem *Nala* (1820), and of *Tuti namah*, a collection of Persian tales, made in collaboration with Iken (Stuttgart, 1822); editions of the Arabian annals of Tabari (1831), of the collection of songs entitled *Kitáb al-Agháni* (1840), and of Indian fables entitled *Pantschatantra* (Bonn, 1848); *Die Geschichte der Universität Greifswald* (Greifswald, 1856-'7); and several works on the history of Pomerania.

**KOSEL**, a fortified town of Prussia, in the province of Silesia, on the Oder, and at the mouth of the Plodnitz, 25 m. S. S. E. of Oppeln; pop. in 1871, 4,517. It has a castle, two churches, a synagogue, and considerable trade. From 1806 to 1859 it was the capital of a duchy.

**KÖSLIN**, a town of Prussia, in the province of Pomerania, 85 m. N. E. of Stettin; pop. in 1871, 13,360. It is the seat of a court of appeal, and has four churches, a gymnasium, and a normal school. On the public place is the statue of Frederick William I., who in 1718 rebuilt the town when the larger portion of it had been destroyed by a conflagration. A railway connects it with Stettin.

**KOSLOV**. See Kozlov.

**KOSSUTH**, a N. county of Iowa, drained by a branch of Des Moines river; area, 576 sq. m.; pop. in 1870, 3,351. It has an undulating surface and a fertile soil. The Iowa and Dakota division of the Chicago, Milwaukee, and St. Paul railroad is in operation to the county seat. The chief productions in 1870 were 52,288 bushels of wheat, 65,137 of Indian corn, 67,825 of oats, 10,449 of potatoes, 86,131 lbs. of butter, and 7,442 tons of hay. There were 891 horses, 874 milch cows, 1,784 other cattle, 424 sheep, and 1,198 swine. Capital, Algona.

**KOSSUTH, Lajos (Louis)**, a Hungarian patriot, born at Monok, county of Zemplén, April 27, 1802. His family, of Slavic descent, were Lutherans and noble. His father, a lawyer, gave his children a liberal education. Lajos, the only son, received his first classical instruction in the gymnasium of the Piarists at Ujhely, studied at Eperies, and passed through a legal and philosophical course at the college of Patak. The spirit which animated this last institution has almost always been one of opposition to the rule of Austria. Kossuth was well read in history, and spoke with almost equal fluency Magyar, Slovak, German, French, and Latin, the last of which was still in part the legal language of his country. Shortly after leaving college, he was appointed an assessor in the assembly of his native county, and soon became noted as a liberal, exceedingly popular with the lower classes, and was for some time manager of the estates of the countess Szapáry in Zemplén. In the diet of 1832-'6 he was proxy of a magnate or member of the upper house, in which capacity he had a deliberative voice, but no vote, in the lower. This diet ranks among the more important assemblies of modern Hungary. Its debates, closely following the Polish tragedy of 1831, were watched with lively anxiety by the patriots, but their publication was hindered by severe restrictions. The opposition, at the suggestion of Kossuth, resorted to the extraordinary means of a written newspaper, the *Országgyűlési tudósítások* ("Parliamentary Communications"). Extracts and comments were dictated by Kossuth to a large number of copyists, and widely circulated. After the close of the diet Kossuth endeavored to continue his activity by a lithographic paper, *Törvényhatósági tudósítások* ("Municipal Communications"), edited in Pesth; but the government prohibited its publication. Kossuth resisted, putting himself under the protection of the county of Pesth. The government sent its prohibition to the latter. The assembly refused to obey, declaring all censorship unconstitutional. Numerous other counties supported Kossuth with equal zeal. He, with several other advocates of the popular cause, was seized in the night (May 2, 1837), tried for treason, and condemned to four years' imprisonment. A general outburst of indignation and an unprecedented agitation followed. The liberals carried the elections for the diet of 1839-'40, and answered the government propositions, the principal of which were demands for subsidies in money and men, with a demand for the liberation of the prisoners. The Thiers ministry in France threatened a general movement in Europe, which was then agitated by the Egyptian question, and the cabinet of Vienna was compelled to yield. Kossuth's liberation was hailed with loud demonstrations. The laws of 1840, enacted under the leadership of Deák, gave new vigor to the opposition. At this juncture Landerer, a publisher of Pesth, having received a license

for the publication of a semi-weekly journal, invited Kossuth to assume its direction. The *Pesti hírlap* ("Pesth Journal") started on Jan. 1, 1841, with fewer than 100 subscribers, but in a month they were numbered by thousands. The national, moral, and material regeneration of the whole people was its avowed aim; the existing constitution was to serve as a means, the aristocracy to have the lead. Count Stephen Széchenyi, in a book entitled *Kelet népe* ("People of the East"), denounced Kossuth as a dangerous agrarian and demagogue. Széchenyi was ready to bestow freedom on the people as a gift; Kossuth demanded it as a right, and threatened to extort it. Baron Eötvös declared in his favor in the pamphlet *Pesti hírlap és Kelet népe*. Public opinion was decidedly in favor of Kossuth, and the *Pesti hírlap* not only became the regular organ of the opposition, which again carried the elections in 1843, but also the oracle of the younger portion of the nation. A difficulty with the publisher, which was not believed to be accidental, removed Kossuth from the editorship, which was transferred to Szalay (July 1, 1844). Kossuth received no license for another journal, and as the new editor of his former organ belonged to a branch of the opposition to which he was most heartily opposed, he found no better medium for the occasional publication of his views than the *Hetilap* ("Weekly Paper"), a small industrial sheet. Hungary was exhausted by a tariff calculated to keep it for ever in a state of colonial dependence on the German provinces, which by another tariff were protected against the competition of England, France, and Belgium. This system formed one of the chief grievances of the nation. Assisted by the most influential members of the opposition, among others by Counts Louis and Casimir Batthyányi, Kossuth now founded the *Védegylet* (protective union), whose members, men and women, bound themselves for five years to use exclusively home-made productions, whenever these could be had. Other societies, agricultural, commercial, and industrial, were practically to assist the protective union. The latter soon counted its members by hundreds of thousands. Kossuth was the animating spirit of the whole organization, which proved less effective for its direct purpose, the development of home industry, than for keeping alive the national agitation, and most of the practical projects failed. The elections of 1847, coinciding with the movements in Switzerland, Italy, and elsewhere, gave a new turn to affairs. Kossuth was elected for Pesth; and Count Széchenyi, though entitled to a seat in the upper house, had himself elected to the lower for Wiesenburg, in order to oppose him personally. A few sessions sufficed to establish Kossuth as a recognized leader of the house. The uncompromising spirit of the two parties seemed to condemn the diet to inaction, when the news of the Paris revolution of February, 1848,

reached Presburg. In a speech delivered on March 3, Kossuth proposed an address to the emperor Ferdinand, urging the restoration of Hungary to its former independence as a state, and the granting of a charter of liberty for the whole Austrian empire. The house of deputies accepted the propositions; the upper house wavered, but the people of Vienna, taking the matter into their own hands, decided the question on March 13. Metternich fled. Kossuth was received in the capital of the empire, whither he now carried his address, with the honors of a liberator, and Louis Batthyányi was intrusted by Ferdinand with the formation of an independent Hungarian ministry, in which Kossuth received the department of finance. The long urged measures of liberal reform were now carried in an amplified shape, and on April 11, 1848, the last diet of Presburg closed its sessions, to make room for a national assembly in Pesth. Foreseeing the coming struggle, Kossuth devoted all his energies, as the leading spirit of the new government, to the organization and consolidation of its powers. He created a treasury, organized the militia, formed new battalions of national soldiery (*honvéds*), established armories, and roused the spirit of the nation by proclamations, speeches, and articles in his new organ, *Kossuth hírlapja* (edited by Bajza), at the same time neglecting no means of bringing about a peaceful solution of the difficulties. The south of Hungary and Transylvania were already engaged in an internecine struggle of races, in which the Rascians, old enemies of the Magyars, were particularly conspicuous. Reaction was triumphant everywhere, the camarilla was flushed by the victories of Radetzky in Italy, and Jellachich crossed the Drave with a large army to subdue Hungary. Batthyányi resigned, the palatine Stephen fled, and Jellachich was approaching the capital. Kossuth in the mean time had begun his armaments and issued treasury notes without the sanction of the king, and in a proclamation he called upon the people to rise and vindicate their rights. He repaired to the people of the Theiss, who flocked around his banners, and on his return entered upon a new course of activity, as head of the "committee of defence." The war of revolution was thus begun. (See HUNGARY.) It was from beginning to end a struggle for life or death under inauspicious circumstances, and the overwhelming power of Russia, the obstinate disobedience of Görgey, the want and the indifference of the governments of Europe, or rather their connivance with Russia and Austria, finally decided against Hungary, which had been declared independent, and Kossuth its governor. On Aug. 11, 1849, he resigned his powers in favor of Görgey, who two days later surrendered to the Russians. Kossuth sought refuge in Turkey, where he and his followers were confined in Widin, Shumla, and subsequently in Kutaiah in Asia Minor. His extradition was demanded by Austria and Rus-

sia, but though he refused the proposed means of evading all danger by an adoption of the Mohammedan religion, the Porte, encouraged by England and France, resisted all threats; and finally, at the intervention of the United States and England, he was allowed to depart with his family and friends. His wife had secretly escaped from Hungary, and his children, two sons and a daughter, had been allowed by Haynau to join him in Asia. On Sept. 1, 1851, he was liberated and set out to embark on the war steamer *Mississippi*, which had been despatched by the United States government, in accordance with a resolution of the senate, to convey him to America as the nation's guest. He had employed the days of his confinement in Asia in the study of military science, and in perfecting his knowledge of living languages. He was able to address the people of the West in French, English, German, and Italian; and when, after visiting Gibraltar and Lisbon, where he was treated with distinction, he finally reached Southampton, he was listened to with no less admiration than sympathy by the English. The same enthusiastic feeling followed him on his tour through the most populous cities of the kingdom, and subsequently through the United States, where he arrived Dec. 5, 1851, accompanied by his wife and Mr. and Mrs. Pulszky. He addressed deputations and meetings in New York, Philadelphia, Baltimore, Washington, and numerous other places, urging the acknowledgment of the claims of Hungary to independence, and the interference of the United States jointly with England in behalf of the principle of non-intervention, which would allow the nations of Europe fair play in a new struggle for liberty. His agitation received a fatal blow by the *coup d'état* of Louis Napoleon, the news of which reached America a fortnight after his arrival, and his call for contributions for a reopening of the struggle in Hungary had therefore a very small result, in spite of the general sympathy with the exile and his cause. At Washington he was received with distinctions which had never been bestowed on any foreigner except Lafayette. He returned to Europe in July, 1852, where for some time he acted in concert with Mazzini and Ledru-Rollin. Preparations for a rising in the spring of 1853, which rapidly consumed the contributions received in the United States, ended with the execution of Jubal, Noszlopi, and others in Hungary, and with the banishment of Kossuth's mother and sisters. His mother died soon after in Brussels; one of his sisters, Mme. Meszlényi, died some time after her arrival in the United States, and another, Mme. Zulyavsky, in 1860; and the only surviving one, Mme. Ruttkay, still resides there. After some participation in newspaper discussions, Kossuth delivered lectures on various topics, but especially on the history and affairs of Hungary, in England and Scotland. The preparations of Napoleon and Victor Emanuel for a war against Austria at the

beginning of 1859 once more rekindled his hope for the liberation of Hungary. He went to Paris, and subsequently to Italy, where he was received with great enthusiasm by the people, and introduced by Prince Napoleon to the emperor of the French, with whom he concerted a common plan of attacking Austria in its Hungarian possessions in case the war should be carried into the interior of Venetia. This was prevented by the peace of Villafranca. Kossuth, bitterly disappointed, returned to England, and the Hungarian legion, formed under Klapka in Sardinia, was dissolved. In 1862 he removed to Turin, where he has since resided, and where he successively lost his daughter and wife. During the war of 1866 he issued an address to the Hungarians, trying to rouse them to action, and subsequently repeatedly and strongly condemned the arrangement with Austria carried through under the lead of Deák. Declining several elections to the diet of Pesth, he has since remained in voluntary exile, occupied with scientific studies, and has published several papers, among them *Farbenveränderung der Sterne* (1871).—His collected writings have been published in the *Europäische Bibliothek* (Wurzen, 1860-'70). Of his speeches various collections have appeared in England, the United States, and Germany. See W. J. Wyatt, "Hungarian Celebrities" (London, 1872).

**KOSTROMA. I.** A central government of European Russia, bordering on the governments of Vologda, Viatka, Nizhegorod, Vladimir, and

Interior of Church of the Holy Trinity at Kostroma.

Yaroslav; area, 30,812 sq. m.; pop. in 1867, 1,101,099. It is traversed by the Volga, which here receives the Kostroma and the Unzha. It consists of wide plains, little varied by gentle acclivities or river banks. There are numerous lakes, of which the largest, the Galitch and the Tchukhloma, measure about 5 m. across. The northern part is comparatively swampy and cold. Extensive woods abound. The soil is generally fertile. Agriculture, the rearing of cattle and sheep, hunting, and fishing are the chief pursuits of the inhabitants. Cloth, leather, and iron are manufactured to some extent. **II.** A city, capital of the government, on the Volga, 190 m. N. E. of Moscow; pop. in 1867, 23,453. It is one of the most interesting cities of E. Russia, is the seat of a Greek bishop, and has about 40 churches, a number of convents, a gymnasium, a seminary, and a monument of the czar Michael Fedorovitch, the founder of the Romanoff dynasty.

**KOTAH. I.** A native state of India, in Rajpootana, bordering on Boondee, Gwalior, and Indore, and bounded N. W. and W. by the Chumbul; area, about 5,000 sq. m.; pop. about 433,000. The surface is for the most part a plain, sloping gently northward from the high table land of Malwah. The soil is generally fertile and well cultivated, but the climate is very unfavorable, being intensely hot during the prevalence of the warm winds of summer, and extremely unhealthy during the rainy season. The rajah of Kotah is in subsidiary alliance with the British, pays a tribute of 184,720 rupees, and maintains an irregular force commanded by British officers. These troops rose against the British, July 4, 1857, and two regiments of the rajah's native army did the same on Oct. 15. The rajah kept faith with his allies. **II.** A city, capital of the state, on the Chumbul, 195 m. S. W. of Agra. It is a town of considerable size, with several temples, mosques, and palaces, and carries on an important domestic and transit trade. It was the scene of the murder of Major Burton and his two sons, and of the burning and plunder of the British residency, during the mutiny in 1857. The town was captured March 30, 1858.

**KÖTHEN**, a town of Germany, in the duchy of Anhalt, 33 m. N. W. of Leipsic; pop. in 1871, 13,563. It has two Protestant churches, a Catholic church, a synagogue, a palace with a library and collection of natural history and coins, a gymnasium, a normal school, and a school of landscape gardening. The trade in grain, wool, and other products is active, but the principal branch of industry consists in sugar refineries, which surround the town in almost every direction. It is at the junction of the Berlin and Anhalt, Magdeburg and Leipsic, and Köthen and Halberstadt railways. The gambling table which formerly existed at the depot has been abolished.—Köthen was formerly the capital of the duchy of Anhalt-Köthen, long associated with German history as an important branch of the Anhalt dynasty.

Duke Augustus Christian Frederick, who died in 1812, produced by his reckless administration a great financial crisis, which under Duke Henry culminated in 1845 in bankruptcy; and an arrangement had to be made with the creditors, whose claims amounted to upward of 4,000,000 thalers. In 1853 Köthen was united with Dessau, and in 1863 the Anhalt territories were united into one duchy.

**KOTSCHY, Theodor**, a German botanist, born at Ustron, Austrian Silesia, in 1813, died in 1866. He accompanied Russegger to Africa, and subsequently explored Asia Minor, and made another journey to Egypt and Persia; and he was the first to give a complete account of the flora of the Nile. He edited the botanical department of Russegger's description of his travels (7 vols., Stuttgart, 1841-'50), and among his numerous other botanical works are *Die Fischen Europas und des Ostens* (Olmütz, 1858-'62), and the posthumous *Plantæ Tinnæana*, a description of Miss Tinné's collection on the Upper Nile.

**KOTZBUS**, or *Cottbus*, a town of Prussia, in the province of Brandenburg, on the Spree, 43 m. S. S. W. of Frankfort-on-the-Oder; pop. in 1871, 18,916, including many Wends, who have a separate church. It contains two other churches, a gymnasium, and a quaint old royal palace. Cloth and wool are extensively manufactured, besides other articles, and there is a considerable traffic. It is the capital of a large circle which formerly belonged to Lower Lusatia as part of the territory acquired in 1445 by the elector Frederick II. of Brandenburg. The treaty of Tilsit allotted the circle in 1807 to Napoleon, who ceded it to Saxony. In 1813 it was reoccupied by Prussia.

**KOTZEBUE. I. August Friedrich Ferdinand von**, a German dramatist, born in Weimar, May 3, 1761, assassinated in Mannheim, March 23, 1819. He studied at the gymnasium of Weimar and the university of Jena, was admitted an advocate in 1780, made himself known by the publication of two books in 1781, and accompanied the Prussian ambassador to St. Petersburg. Here he was employed as secretary of the governor general, and after his marriage in 1785 with a daughter of Lieut. Gen. Von Essen, he was appointed to a high judicial office in the province of Esthonia, and was ennobled, which afterward led him to write a fulsome work on nobility. His literary reputation was established by several successful novels and dramas, but injured by the publication of *Doctor Bahrdt mit der eisernen Stirn*, in which he attacked the celebrated poets of Weimar (Goethe, Schiller, &c.), who had declined to admit him into their society. After the death of his wife he visited Paris, on which occasion he wrote another ill-mannered book, *Meine Flucht nach Paris* (1790). After his return to Russia, he devoted several years to writing a series of plays till 1798, when he succeeded Alxinger as poet to the court theatre at Vienna. In 1800 he returned to Russia,

where he was arrested on suspicion of having written pamphlets against the emperor Paul, and banished to Siberia. He was indebted for his liberation to one of his plays, *Der Leibkutscher Peters des Grossen*, which presented the emperor in a flattering light, and published *Das merkwürdigste Jahr meines Lebens* (1801), a rather romantic description of his year of exile. He received an estate in Livonia, and was made director of the German theatre in St. Petersburg and imperial councillor. In 1802 he took up his abode in Berlin, where he became a member of the academy of sciences, and one of the editors of *Der Freimüthige*, a literary journal. In 1805 he published an account of travels made in the preceding years in France and Italy; and in 1808-'9 appeared his *Preussens ältere Geschichte*, esteemed only for its collection of authentic historical documents. After 1806 he lived again in Russia, but returned to Germany in 1817 to report to the Russian government on the state of public opinion. He resided alternately at Weimar and Mannheim, and at the same time conducted a weekly journal. When it became known that he was the author of letters to the czar, and of articles in which the secret political associations of the German students (*Burschenschaften*) were held up to scorn and ridicule, a student named Sand went to Mannheim and stabbed Kotzebue in the breast with a dagger, exclaiming, "This is for you, traitor to your country."—Kotzebue was the most fertile writer of plays whom Germany ever produced. Many of them have been translated into English, French, and other languages. Among those best known on the American and English stage are "The Stranger" and "Pizarro," both adapted by Sheridan, the former from Kotzebue's *Menschenhass und Reue*, and the latter from *Die Incas in Peru*. He wrote in all 211 tragedies, comedies, and farces, and some of them retain their popularity. Complete editions of his dramatic works appeared in Leipsic in 1797-1823, in 28 vols., and in 1827-'9, in 44 vols. His most successful novel, written in early life, is *Leiden der Ortenbergischen Familie*. His posthumous writings were published in Leipsic in 1821. An English translation of his autobiography appeared in London in 1800. His German biographers are Cramer (Leipsic, 1819) and Döring (Weimar, 1829). **II. Otto von**, a Russian traveller, son of the preceding, born in Revel in December, 1787, died there in February, 1846. He was educated at the academy of St. Petersburg, and joined Krusenstern as midshipman in a voyage round the world, from which he returned in 1806. He was promoted to the rank of lieutenant, and intrusted in 1815 with the command of the *Rurik*, a vessel equipped at the expense of Count Rumiantzeff. He was joined in this expedition by the poet Chamisso, and by the naturalists Eschscholtz and Choris. After the discovery of various islands, bays, and a sound N. E. of Behring strait since called after him, he returned to Russia, Aug. 3, 1818,

and published an account of his journey, which has been translated into French and English ("A Voyage of Discovery into the South Sea and Behring's Strait in the Years 1815-'18," 3 vols., London, 1821). In 1823 he undertook a third voyage around the world as captain of an imperial man-of-war. Touching at Rio de Janeiro, he doubled Cape Horn, discovered several islands, collected much valuable information on ethnography, natural history, and geography, visited Lower California and the Sandwich islands, and on his way home touched at the Philippine islands, reaching Cronstadt July 10, 1826. In 1829 he retired from active service, and spent the rest of his life with his family in Esthonia. He published a narrative of his voyage, of which an English translation appeared in London in 1830 ("A New Voyage round the World in the Years 1823-'6"). The romantic character of the narrative led several critics to impugn its veracity, although there is no evidence by which the charge can be supported. Eschscholtz enriched the volume with full zoological information. **III. Moritz von**, a Russian soldier, brother of the preceding, born May 11, 1789, died in Warsaw in February, 1861. He sailed with Krusenstern and his brother Otto round the world, entered the Russian army in 1806, was captured by the French in 1812, liberated in 1814, and published in 1815 *Der russische Kriegsgefangene unter den Franzosen*, an account of his adventures. Attached to the Russian embassy, he made a journey to Persia in 1817, of which his father published a description in Weimar in 1819 (English translation, "Narrative of a Journey into Persia in 1817," London, 1819). He served subsequently in the Caucasus, commanded the fortress Ivangorod in Poland, and was made a general in 1846. At the time of his death he was a member of the Polish division of the Russian senate. **IV. Paul**, a Russian soldier, brother of the preceding, born about 1790. He fought with distinction in the Caucasus and in Poland, and was rapidly promoted. In 1862 he became governor general of Bessarabia and South Russia, and commander of Odessa, offices which he still held in 1874, when he was made a count. **V. Alexander von**, a painter, brother of the preceding, born in Königsberg, June 9, 1815. After graduating as an officer in 1834, he studied painting at the academy of St. Petersburg. In Paris (1847-'8) he associated much with Horace Vernet. He afterward lived in Stuttgart, visited Rome, and settled in Munich. He has executed many brilliant pictures of Russian victories for the Winter palace and other galleries.

**KOULI KHAN.** See NADIR SHAH.

**KÖVÁR**, a district of eastern Hungary, bordering on the counties of Mármaros, Szathmár, and Middle Szolnok, and on Transylvania; area, 423 sq. m.; pop. in 1870, 51,744. From 1849 to 1860 the district belonged to the Transylvanian circle of Dées; but in 1860 it was again constituted an independent Hungarian

district. The principal places are Nagy-Somkut, the capital, and Kapnik-Bánya.

**KOVNO** (Pol. *Kowno*). I. A W. government of European Russia, bordering on Prussia and on the governments of Courland, Wilna, and Suwalki, and nearly touching the Baltic; area, 15,687 sq. m.; pop. in 1867, 1,131,248, chiefly Lithuanians, Samogitians, Poles, Germans, and Jews, with but few Russians proper. It is traversed by the Niemen and its affluents, and contains many dense forests. The principal products are flax and timber, the latter being rafted down the streams to Tilsit. It was formed in 1843 from the N. part of Wilna, to the military division of which it still belongs. Kovno is nearly identical with the ancient maritime Lithuanian province of Samogitia (Lith. and Pol. *Żmudź*), which was a separate duchy under the Polish crown, and which was renowned for its commerce and navigation, and for the pure Lithuanian type of the inhabitants, who were not fully converted to Christianity till the 16th century. The capital, Rossieny on the Dubisa, the chief town of a circle of Kovno and Polangen, is now as then the principal port connecting with the Baltic. II. A city, capital of the government, at the junction of the Vilia with the Niemen, 420 m. S. S. W. of St. Petersburg; pop. in 1867, 34,612, including about 18,000 Jews and many Germans. It contains numerous Catholic churches and convents, besides places of worship for the national religion, and for Lutherans and Jews, a gymnasium and district school for the nobility, and a pyramid commemorating the deliverance from French invasion in 1812. Commerce and navigation are exceedingly active, and new railways increase the traffic. About 3 m. from the town is the magnificent Camaldulensian convent Pozayscie or Peace Mountain, with the tomb of the Lithuanian great chancellor Pac, who built it in 1674 at an enormous cost. The French crossed the Niemen at Kovno, June 23-25, 1812; and the Poles were defeated here on June 26, 1831.

**KOZLOV**, a town of Russia, in the government and 40 m. N. N. W. of the city of Tambov, on the Lesnoi Voronezh; pop. in 1867, 24,616. It has nine churches, and large tanneries and tallow-smelting establishments. It is a great centre of trade in grain, cattle, salted meat, tallow, and other articles; and there are in the district about 40 breeding stables of famous horses.

—For Kozlov in the Crimea, see EUPATORIA.

**KRAJOVA**. See KRAYOVA.

**KRAKEN**. See OCTOPUS.

**KRANACH**, Lucas. See CRANACH.

**KRASICKI**, Ignacy, a Polish prelate, surnamed the Voltaire of Poland, born at Dubiecko, Galicia, Feb. 3, 1734, died in Berlin, March 14, 1801. His ancestors had been renowned as scholars and warriors. He completed his ecclesiastical studies in Rome, and after having been a canon and curate he was promoted in 1767 to the see of Ermeland; this was annexed

to Prussia in 1772, and he became a favorite of Frederick the Great. The Roman Catholic Hedwigskirche was built in Berlin under his influence, and he consecrated it in 1780. In 1795 he was made archbishop of Gnesen, to which town his remains were removed in 1829 from their first burial place in the Hedwigskirche. His *Myszeis* ("Mousiad"), a comic poem illustrating the story in Kadlubek's chronicle of King Popiel devoured by rats and mice (Warsaw, 1775; Leipsic, 1790), and his "Adventures of Doswiadczynski" (1775), suggesting educational reforms, have been translated into French. His *Monomachia* ("War of Monks," 1778) has been compared to the writings of Boileau, and was at the request of Frederick composed in the room which Voltaire had occupied at Sans-Souci. His *Anti-Monomachia* is a vindication and not a refutation of the previous work. Among his most admired productions are his "Satires" (1778) and his "Fables," which latter are unique, though not all original, and have been repeatedly translated into French. His *Wojna chocimska* ("War of Khotin," 1780) is a historical epic; and his *Pan Podstoli* ("Mr. Sub-Chamberlain") satirizes the follies and vagaries of his countrymen. He also made an exquisite free translation into Polish of Ossian (1780). His complete works were edited by Dómchowski (10 vols., Warsaw, 1803-'4; new eds., Paris, 1830, and Berlin, 1845).

**KRASINSKI**. I. Waleryan, count, a Polish author, born in the Polish province of White Russia about 1780, died in Edinburgh, Dec. 22, 1855. He entered the Polish civil service at an early age, and while still a young man became head of the ministry of public instruction. In this post he effected many useful reforms. Through his influence the Jews were aided in founding a rabbinical college at Warsaw. He paid special attention to the diffusion of useful literature among the people, and introduced stereotype printing into Poland. On the breaking out of the revolution of 1830 he was sent as one of an embassy to England to advance the Polish cause. Driven into exile, and losing his fortune by the result of the war, he went to London, and for the remainder of his life devoted himself to literature. He published "The Rise, Progress, and Decline of the Reformation in Poland" (2 vols., London, 1839-'40); "Panславism and Germanism" (1848); "Lectures on the Religious History of the Slavonian Nations" (Edinburgh, 1851); and "Montenegro and the Slavonians in Turkey" (1853). II. Zygmunt Napoleon, count, a Polish author, descended from a branch of the same family with the preceding, born in Paris, Feb. 19, 1812, died there, Feb. 24, 1859. He was the son of Count Wyncenty Krasinski, who succeeded Poniatowski in the command of Napoleon's Polish cavalry, and afterward entered the service of Russia. Here the favor which the court extended to him would have been continued to his son, had not young Krasinski,

indignant at the treatment of his Polish countrymen, and warmly espousing their cause, refused all offers of advancement in the Russian service, and left the country soon after attaining his majority. From this time he led a somewhat wandering life, residing successively in several European capitals, and devoting himself to literary pursuits, at first publishing anonymously, and afterward under his own name. His principal works, nearly all of which were inspired by strong patriotic feeling, and were undertaken in the interest of the Polish cause, are: *Nieboska komedya* ("The Undivine Comedy," in three parts, Paris, 1837-'48); *Irydion*, an imaginative poem in German on the sufferings and future of the Slavic race (Berlin, 1845); *Noc letnia* ("The Summer Night"), *Pokusa* ("The Temptation"), a collection of lyrics under the title *Przedświt* ("Before Dawn"), and *Psalmy przyszłości* ("Psalms of the Future," 5th ed., Paris, 1861). An edition of Krasinski's collected works appeared at Leipsic (3 vols., 1863), as one of the series called *Biblioteka pisarzy polskich* ("Library of Polish Authors"). Owen Meredith's "Fool of Time" is confessedly founded upon Krasinski's *Nieboska komedya*; and the question whether the English poet was entirely justified in the use made of the material has given rise to some discussion. Besides French and German translations, an English rendering of the *Komedya*, made through a German version, was published by Mrs. Martha Walker Cook in the "Continental Magazine" (New York, 1864).

**KRASSÓ**, a S. county of Hungary, in the circle beyond the Theiss, bounded N. by the Maros, and E. by Transylvania; area, 2,019 sq. m.; pop. in 1870, 259,079, the majority of whom were Roumans and the remainder Germans, Croats, and Magyars. It abounds in rich pasturage, forests, and mines. The principal places are the county town Lugos, and the market town Krassó or Krassova, from which the county has its name.

**KRASZEWSKI, Józef Ignacy**, a Polish author, of Lithuanian origin, born in Warsaw in 1812. He studied at the university of Wilna, and was under arrest from 1831 to 1834 on account of his revolutionary sympathies. In 1837 he married a daughter of the archbishop and author Woronicz, and settled in Volhynia, where he was honorary curator of schools from 1853 to 1858, when he went abroad. In 1860 he established himself in Warsaw as editor of the *Gazeta polska*, and in 1863 he removed to Dresden, where he subsequently delivered lectures. He edited the "Polish Athenæum," a literary periodical (18 vols., 1842-'8), and his *Studia literackie* ("Literary Essays," 1842), and *Nowe studia literackie* (2 vols., 1843), throw much light on letters and science. His principal historical works are *Wilno* (4 vols., 1840-'42), and *Litwa* (2 vols., 1847-'50), relating to Lithuanian manners and social life. Conspicuous among his

poetical writings is *Anafielas* (3 vols., 1840-'43), taking its theme from the most impressive events in the early history of Lithuania. He has also published books of travel, miscellaneous writings, and sketches of the insurrection of 1863. His complete works comprise more than 300 volumes, including many novels and stories descriptive of Polish life, which are his most popular productions.

**KRASZNA. I.** An E. county of Hungary, in the circle beyond the Theiss, bounded S. E. by Transylvania; area, 444 sq. m.; pop. in 1870, 62,714, most of whom are Roumans. It is mostly mountainous, and only in the valleys suited for agriculture. Before 1860 this county belonged to Transylvania. Capital, Szilágy-Somlyó. **II.** A market town, on the Kraszna, 5 m. S. E. of Szilágy-Somlyó; pop. in 1870, 3,128. The inhabitants, partly Magyars and partly Roumans, trade in cattle.

**KRAUSE, Karl Christian Friedrich**, a German philosopher, born in Eisenberg, May 6, 1781, died in Munich, Sept. 27, 1832. He was educated at Jena, where he was tutor from 1802 to 1804. He then renounced teaching to devote himself to his philosophical studies, and resided successively in Rudolstadt, Dresden, and Berlin, made several journeys through Germany, France, and Italy, and lectured at Göttingen from 1824 to 1831, when he retired to Munich. The aim of his speculations was to represent humanity as an organic and harmonious unity; and he conceived the scheme of an association of all mankind, which should labor for a uniform and universal development. The germ of such a union he thought he found in freemasonry. His works include *Vorlesungen über das System der Philosophie* (Göttingen, 1828; new ed., Leipsic, 1874), and *Vorlesungen über die Grundwahrheiten der Wissenschaft* (Göttingen, 1829).

**KRAUTH, Charles Porterfield**, an American theologian, born in Martinsburg, Va., March 17, 1823. He is the son of the Rev. Charles Philip Krauth, former president of Pennsylvania college, Gettysburg. He graduated there in 1839, entered the Lutheran ministry in 1841, and was pastor successively of churches in Baltimore, Md., Winchester, Va., and Pittsburgh, Pa. In 1852-'3 he visited the Danish West Indies, and for three months of that time, during the severe prevalence of the yellow fever, preached in the Dutch Reformed church in St. Thomas. A sketch of his tropical experiences was published afterward under the title "A Winter and Spring in the Danish West Indies." He was pastor of St. Mark's Lutheran church in Philadelphia from 1859 to 1864, and in 1861 became editor of the "Lutheran and Missionary." In 1864 he was elected professor of systematic theology and church polity in the Lutheran theological seminary in Philadelphia, and in 1868 of intellectual and moral philosophy in the university of Pennsylvania, of which he was elected vice provost in 1873. He has been for three

successive terms president of the general council of the Lutheran church in America. He has been among the most active laborers in the liturgical movements of his church, edited "The Jubilee Service," and bore a prominent part in the preparation of the "Church Book," set forth by authority of the general council in 1869. He has gathered a large and valuable library, and has become distinguished as a Biblical and historical writer. He is a member of the oriental and philosophical societies, the historical society of Pennsylvania, and the American committee coöperating with the British committee in revising the authorized version of the Scriptures. His chief distinction as an author is due to a work entitled "The Conservative Reformation and its Theology" (8vo., Philadelphia, 1871). He has also published "Three Essays on Poverty," and a number of special discourses and of dissertations in explanation and defence of the Augsburg confession, and has contributed largely to theological and literary periodicals, especially upon the internal history and relations of the authorized version of the Scriptures. He has translated Tholuck's commentary on John (1859), and Ulrici's review of Strauss (1874); and has edited Fleming's "Vocabulary of Philosophy," with an introduction and syncretical and bibliographical indexes (2d ed., 1860), and Berkeley's "Principles of Knowledge," with extended prolegomena, Ueberweg's notes, and a large amount of original annotation (1874).

**KRAYOVA**, or *Krajova*, a town of Roumania, capital of Little Wallachia, near the river Shyl, 113 m. W. of Bucharest; pop. in 1867, 21,521. It is a fine town, containing several churches, a court of appeal, a gymnasium, a normal and a Lancasterian school, and a public park. It has a considerable commerce, and in the vicinity are salt works. Sultan Bajazet was defeated here in 1397 by the Wallachian waywode Mirxa. The Russians occupied the town in 1853, and had several skirmishes with the Turks, who regained possession in May, 1854.

**KREMENTCHUG**, a town of European Russia, in the government and 60 m. S. S. W. of the city of Poltava, at the entrance of the Kagamlyk into the Dnieper, over which a long bridge has been built; pop. in 1867, 20,251. It has seven churches, numerous factories of gold and silver ware, and is the most important commercial town of the government.

**KREMLIN**. See Moscow.

**KREMNITZ** (Hun. *Körmöcz-Bánya*, the latter word meaning mine), the principal mining town and a free royal city of Hungary, in the county of Bars, 82 m. N. of Pesth; pop. in 1870, 8,442. It is situated in a deep valley, surrounded by rugged hills and mountains, has several suburbs, a mint, various mining establishments, smelting and washing works, a vitriol factory, paper mills, and other manufactories, and contains the principal offices of the surrounding gold and silver mining region.

An aqueduct supplies it with water. Its mines consist of about a dozen principal and various minor shafts, the produce of which has greatly decreased in recent times. The Austrian ducats are coined in Kremnitz. The town was founded in the 12th century by German emigrants, whose descendants form the present population. It has a castle, a Catholic gymnasium, six churches, and a hospital for miners.

**KREMS**, a town of Austria, in the crown-land of Lower Austria, at the entrance of the river Krems into the Danube, 38 m. W. N. W. of Vienna; pop. in 1870, 6,114. It has four churches, a college of the Piarists, a gymnasium, a military school, and manufactories of silk, velvet, and steel ware.

**KREMSIER**, a town of Moravia, 20 m. S. S. E. of Olmütz, on the March or Morawa, over which there is a chain bridge 70 ft. long; pop. in 1870, 9,823. It is the summer residence of the archbishop of Olmütz, has three churches, a castle with a picture gallery, library, and museum of natural history, a monastery of the Piarists, a gymnasium, and a military institution. From Nov. 15, 1848, to March 7, 1849, the Austrian Reichstag was assembled here.

**KREUZNACH**. See CREUZNACH.

**KRILOFF**. See KRYLOFF.

**KRISHNA**. See INDIA, RELIGIONS AND RELIGIOUS LITERATURE OF.

**KRISHNA**, a river of India. See KISTNAH.

**KRONSTADT**, a seaport of Russia. See CRONSTADT.

**KRONSTADT** (Hun. *Brassó*), a city in the Saxon division of Transylvania, Transleithan Austria, near the frontier of Wallachia, 65 m. E. S. E. of Hermannstadt; pop. in 1870, 27,766, of whom about 10,000 were Germans, 9,000 Roumans, 4,000 Magyars, and the remainder chiefly Jews and gypsies. It is the largest and most flourishing town in Transylvania, situated in a narrow valley enclosed by mountains. Charming villas on the slopes, with here and there an old castle on the heights, give a varied and picturesque aspect to the surrounding scenery. It consists of an inner town, which is encircled by a wall and entered by five gates, and three suburbs, of which one, called the upper town or *Bolgár*, extends into the mountain passes, winds up the slopes, covering them with beautiful country mansions and well kept gardens and orchards, and is the favorite residence of the wealthy Roumans. The principal streets of the inner town are well paved and clean, and the houses generally well built. It has a large market place, with two fountains, and at the main gate an esplanade covered with avenues of shady trees. There are three gymnasia, several other schools, a chamber of commerce, and military hospital. Kronstadt has iron and copper works, paper mills, manufactures of woollen, linen, and leather, and carries on a brisk trade in the products of the region.—The foundation of Kronstadt is traced back to the early part of the 13th century. In the 16th it was the starting point of the reformation in

Transylvania, which was promoted by Honterus, a disciple of Melancthon, who is said to have been in intimate correspondence with Luther, and to have also established the earliest printing press here (1533), its first productions being the Augsburg Confession and Luther's writings. Here, too, the first paper mill was erected. Kronstadt was formerly surrounded by strong fortifications, which are now in ruins. Northeast of the town is a small citadel, situated on the summit of an isolated hill, which was not without importance in the Hungarian war of 1848-'9.

**KROO**, or **Kru**, a negro race on the W. coast of Africa, whose territory extends from Cape Mesurado, on the right shore of the river St. Paul, to St. Andreas, a district generally known as the Pepper coast. According to a legend current among the Mandingos and Foolahs, the Kroos were driven by them out of the interior of central Africa. Their neighbors, the Akevom, who extend as far as the river Assinie, are supposed to be ethnologically closely related to them. They are the so-called Kroomen, who are employed as sailors, boatmen, storemen, and sometimes as mechanics, and in whom a traffic is carried on by the factors and shipmasters on the coast. (See LIBERIA.)

**KROTOSCHIN** (Pol. *Krotoszyn*), a town of Prussia, capital of a circle, in the province and 52 m. S. E. of the city of Posen; pop. in 1871, 7,866, including over 2,000 Jews. It contains places of worship for Roman Catholics, Protestants, and Jews, and gives title to a mediatised principality which was conferred in 1819 upon Prince Thurn and Taxis, on the relinquishment of a portion of his postal monopoly. The trade in wool is considerable, and cloth, chicory, tobacco, and other articles are manufactured here.

**KROZET**, or **Crozet**, a group of four small islands in the Indian ocean, between Kerguelen and Prince Edward islands, of volcanic origin, and composed chiefly of large rocks. Possession island, the largest of the four, is 20 m. long and 10 m. broad, with three bays, of which America bay is most frequented by sealers, who subsist on albatross eggs and the flesh of the young albatross, on wild ducks, goats' flesh, and the tongue and flippers of the sea elephant. It contains some patches of land, and as the temperature is rarely very low, it is believed that potatoes and vegetables would thrive. Penguin or Inaccessible island, a mere rock, derives its names from its inaccessibility, and from the abundance of penguins. Pigs' island, the most western of the group, which is less desolate, was so named from the pigs left there in 1834, which have increased to such an extent that they overrun the whole island, and afford abundant food for the sailors. The most eastern, in lat. 47° S., lon. 48° E., is known as East island, and is about 1 m. in diameter and 4,000 ft. high, with precipices rising in some places perpendicularly from its shores. The Krozet islands were select-

ed in 1874 as an American and British station for the observation of the transit of Venus.

**KRÜDENER**, **Juliane de Vietinghoff**, baroness, a Russian novelist and mystic, born in Riga, Nov. 21, 1764, died in Karasu-Bazar, Crimea, Dec. 25, 1824. She was carefully educated in the house of her father, Baron Vietinghoff, one of the wealthiest proprietors in Livonia, and was early remarkable for intelligence and for a tendency to revery and melancholy. In 1777 she visited Paris with her parents, and on her return at the age of 18 was married to a Russian diplomatist, Baron Krüdener, whom in 1784 she accompanied to Venice and other cities of Italy, and afterward to Copenhagen and Paris; and in 1791 she made a journey through the south of France. Of a singularly naive and romantic character, she was guilty of numerous indiscretions, which led to a separation from her husband in 1791. After an adventurous life, with a reputation for beauty and wit, in various cities of Europe, she went to Paris in 1803 with literary schemes. Her romance *Valérie* appeared in that year, marked by a vague melancholy and light and graceful style, which, with the support of her friends, secured it a brilliant success. Returning to Riga, and remaining for a time in retirement, she resolved to change her manner of life, and to devote herself solely to the conversion of sinners and the consolation of the wretched. In this pious design she was confirmed by travelling in Germany, by correspondence with the Moravian Brethren, and by an acquaintance with the theosophist Jung-Stilling. Her correspondence for several years abounds in mystical effusions, more elegant though less profound than those of Mme. Guyon, and reveals her double tendency to illuminism and to worldly frivolity. At Paris in 1814 she held religious assemblies in her house, which were frequented by the most important personages. Her spiritual exaltation assumed the character of prevision, and in a letter she foretold in vague terms the escape of Napoleon from Elba, his triumphant return to Paris, and the second exile of the Bourbons. This letter was communicated to the emperor Alexander of Russia, in whom it awakened great interest toward her, and whom she met at Heilbronn in May, 1815, and accompanied to Heidelberg, the headquarters of the allies, and after the battle of Waterloo to Paris. She was present at the grand review of the Russian army in the plain of Châlons, which she described under the title of the *Camp des vertus* (1815). The articles of the holy alliance are said to have been submitted to her revision. Her doctrines, agreeing with the forms of no Christian communion, caused several of the German states to forbid her residence in them. She passed the latter part of her life among the poor and the sick, manifesting an unwearying ardor, and joyously sacrificing herself for the solace of the wretched. In 1818 she returned to Russia, where the emperor continued his

interest in her romantic views, but forbade her to preach publicly. She lost his favor, and was ordered to leave St. Petersburg, when, in her enthusiasm for the cause of the Greeks, she divulged some of his communications on the policy of the czars in the East. Her health was suffering from ascetic rigors, when early in 1824 she joined the princess Gallitzin in the scheme of founding a colony in the Crimea, which was to consist of her disciples. She arrived at Karasu-Bazar, the site selected, in September of that year, and was busy in preaching in French and German to the astonished inhabitants, till after a few months the malady which had afflicted her before her arrival caused her death. The sincerity of Mme. de Krüdener in her mysticism and her apostolic labors has not been questioned.—See Eynard, *Vie de Mme. de Krüdener* (Paris, 1849), and *Frau von Krüdener, ein Zeitgemälde* (Bern, 1868).

**KRUG, Wilhelm Traugott**, a German philosopher, born at Radis, June 22, 1770, died in Leipsic, Jan. 13, 1842. He was educated at the university of Wittenberg, where in 1794 he became adjunct of the philosophical faculty. His *Ueber die Perfectibilität der geoffenbarten Religion* (Jena and Leipsic, 1795) was the cause of his not receiving a professorship, and was followed by other works, chiefly in development of the Kantian philosophy, of which he was one of the most efficient promulgators. He was appointed professor of philosophy at Frankfort-on-the-Oder in 1801, and published in 1803 his principal work, *Fundamentalphilosophie*, in which he proposed a system under the name of "transcendental synthetism," which, as he maintained, reconciled idealism and realism. In 1804 he succeeded Kant as professor of logic and metaphysics at Königsberg, and in 1807 also Kraus as professor of practical philosophy. In 1809 he accepted a professorship of philosophy at Leipsic, which he held till 1834, when he received a pension from the state. He was one of the presidents of the democratic society founded at Königsberg after the peace of Tilsit under the name of the *Tugendbund*; joined in 1813 the Saxon corps of *chasseurs à cheval*; and was afterward a leading champion of German liberalism against Ancillon, Kotzebue, and others. Among his more important works are *Allgemeines Handwörterbuch der philosophischen Wissenschaften* (4 vols., Leipsic, 1827-'8), and an autobiography entitled *Meine Lebensreise in sechs Stationen, von Urceus* (Leipsic, 1826), to which he added a supplementary volume entitled *Leipziger Freuden und Leiden im Jahre 1830* (Leipsic, 1831).

**KRUMMACHER. I. Friedrich Adolf**, a German theologian, born at Tecklenburg, Westphalia, July 13, 1768, died in Bremen, April 14, 1845. His first appointment was to the professorship of theology in the university of Duisburg. He next became pastor of the Reformed church at Crefeld, and afterward exchanged that cure for the rural living of Kettwich. In 1819 he

was called to Bernburg, where he became councillor of the consistory and chief pastor, and in 1824 became pastor of St. Anschaire in Bremen. He was a voluminous writer, both in prose and poetry. His principal works are: "Cornelius the Centurion," "Life of St. John" (both translated into English, Edinburgh, 1840); "The Sufferings, Death, and Resurrection of Christ;" *Die Kinderwelt*, a series of sacred poems for the young; and "On the Spirit and Form of Evangelical History in its Historical and Æsthetical Relations." He is best known, however, by his fables or *Parabeln*, which appeared in 1805, and passed through many editions. They have been translated into English, and added in 1858 to Bohn's "Illustrated Library," with 40 illustrations. His life has been written by Möller (*Friedrich Adolf Krummacher und seine Freunde*, 2 vols., Bonn, 1849). **II. Gottfried Daniel**, brother of the preceding, born in Tecklenburg, April 1, 1774, died in Elberfeld, Jan. 30, 1837. He was educated at Duisburg, and afterward became a popular preacher at Bärth and Wolfrath. In 1816 he was made pastor of the Reformed church at Elberfeld, and was recognized as the head of the pietists in that district. Among his most important works are *Die evangelische Heiligung* (Elberfeld, 1832), and *Tägliches Manna*, or "Daily Manna" (1838). **III. Friedrich Wilhelm**, son of Friedrich Adolf, born in Duisburg in 1796, died in Potsdam, Dec. 10, 1868. He was a minister of the Reformed church, but a strenuous opponent of the rationalistic school of theologians. In 1843 he declined an invitation to a theological professorship at Mercersburg, Pa. In 1853 he was appointed chaplain of the Prussian court at Potsdam. He was regarded as one of the most eloquent preachers in Germany. Among his numerous works, most of which have been translated into English, are "Elijah the Tishbite," "The Last Days of Elisha," "Solomon and the Shulamite," "Sermons on the Canticles," and "Glimpses into the Kingdom of Grace." In 1856 appeared in Berlin his *Bunsen und Stahl*. Among his later devotional works are *Gottes Wort* (Berlin, 1865), and *David der König von Israel* (1866; English translation, 1870). His sermons were collected and published in Berlin in 1868. Soon after his death his daughter edited and published his autobiography, which has been translated into English (2d ed., London, 1871).

**KRUPP, Alfred**, a German manufacturer, born at Essen, Rhenish Prussia, early in the present century. He succeeded his father, Friedrich Krupp, as proprietor of the cast-steel works at Essen, and sent to the London exhibition of 1851 a crucible block weighing 2½ tons, and to the Paris exhibition of 1867 one of 40 tons. He gradually developed the Essen works, which were originally established in 1810, to an enormous extent. They covered in 1873 an area of 965 acres, and produced more than 125,000 tons of cast steel, be-

sides great quantities of finished articles. The works are connected with the main Rhenish railway lines, and contain more than 30 m. of rail tracks to facilitate the traffic, and there are 30 telegraph stations in the establishment. About 12,000 men are employed here, besides 5,000 in the mines and smelting works, and others in other departments, making a total of about 20,000. Krupp has built for his officers and men good dwelling houses and hospitals. A sick, burial, and pension fund had an income in 1873 of \$80,000, and the expenditures amounted to about \$60,000. Another fund secures free medical attendance upon an annual payment of 75 cents. The works at Essen in 1874 included 1,100 smelting and other furnaces, 275 coke ovens, 264 smiths' forges, 300 steam boilers, 71 steam hammers, including a monster hammer similar to Nasmyth's, 286 steam engines with an aggregate of 10,000 horse power, 1,056 machine tools, a chemical laboratory, and photographic, lithographic, and printing and bookbinding establishments. A fire brigade of 70 men acts also as a police force, besides 166 watchmen. The consumption of coal in 1872 was 500,000 tons; coke, 125,000 tons; gas, 155,000,000 cubic feet, for 16,500 burners. The articles manufactured include guns, gun carriages, shot, boiler plates, rolls, spring steel, machinery, axles, wheels, rails, and springs for railways and mines, and shafts for steamers. Krupp was the first to introduce unwelded cast-steel tires for use on railways. He owns extensive coal and iron mines in various parts of Germany, besides having concessions of iron mines in Spain. His smelting works, chiefly on the Rhine, contain nearly 300 coke ovens, and annually produce 120,000 tons of pig iron. He accepted the title of privy commercial councillor, but in 1864 declined patents of nobility. To the Vienna exhibition of 1873 he sent remarkable specimens, comprising siege guns and other pieces of artillery, and ammunition. In 1874 he received so many orders from various governments that he negotiated a loan of 12,000,000 thalers for the extension of his works.

**KRUSENSTERN, Adam Johann von**, a Russian navigator, born at Haggud, Esthonia, Nov. 19, 1770, died in Esthonia, Aug. 24, 1846. From 1793 to 1799 he was in the English service. During the reign of Alexander I. he was made a captain in the Russian navy, and placed in command of a scientific and commercial expedition planned by himself, which sailed from Cronstadt in the summer of 1803, to explore the north Pacific coasts of America and Asia. It was described by Espenburgh, Lisianskoi, Langsdorff, Tilesius, and in part by Krusenstern himself, in his *Reise um die Welt in den Jahren 1803-6* (3 vols., St. Petersburg, 1810-12), which has been translated into many languages (English translation by Hoppner, London, 1813; French, 1821). He was made curator of the university of Dorpat in 1824, vice admiral in 1829, and admiral in 1841.

**KRYLOFF, or Krloff, Ivan**, a Russian author, born in Moscow, Feb. 13, 1768, died in St. Petersburg, Nov. 21, 1844. While a boy he wrote several comedies, and having obtained a place as clerk in one of the public offices, he devoted his leisure to study. In 1801, having been recommended to the empress Maria, he became secretary to Prince Gallitzin. This office, however, was purely honorary, and he spent several years at the country house of the prince, engaged in literary labors. In 1812 he received an appointment in the imperial library, and in 1830 he was made councillor of state. He wrote plays, and contributed to various journals and periodicals, but was most successful in writing fables in imitation of those of La Fontaine. They were collected and published in numerous editions of various styles, cheap and expensive, and are as common in Russian households as the "Pilgrim's Progress" is in England. They were translated into French by several of his friends (Paris, 1825), and have been translated repeatedly into several modern languages. The best translation in French is by Einerling (Paris, 1845); in English, by Ralston (London, 1871); and in German, by Löwe (Leipzig, 1874).

**KUBAN**, a territory of European Russia, in Ciscaucasia, and in the lieutenantancy of Caucasia; area, 36,251 sq. m.; pop. in 1871, 672,224, including nearly 100,000 Mohammedans, the rest being chiefly members of the national church. It is the most populous and extensive region of Ciscaucasia, comprising the territories of the Cossacks in the district (*oblast*) of Kuban (pop. over 300,000) and in their Transkuban districts (pop. over 100,000), besides various tracts of land inhabited by different tribes and some almost desert regions on the Black sea. It is divided into several circles, and contains small towns. The Cossacks are under the authority of a lieutenant general. Capital, Yekaterinodar. (See CAUCASUS.) The principal river is the Kuban, which rises in Circassia at the foot of Mount Elbruz, and after a N., N. W., and W. course of about 500 m. falls into a bay of the Black sea. It has a number of small tributaries, and is navigable only for the smallest craft.

**KUBLAI KHAN**, called in Chinese SHE-TSU and HU-PE-LI, the founder of the 20th or Mongol dynasty of Chinese emperors, born in the earlier part of the 13th century, died in Peking in 1294. He was the grandson of Genghis Khan, under whom the conquest of China had been commenced. A branch of the great Tartar family, known in Chinese history as the oriental Tartars, had harassed the feeble and debauched princes of the Sung dynasty, then governing the principal provinces of China, to such an extent that Li-sung, the reigning emperor about 1250, called in the western Tartars, of whom Kublai Khan was sovereign, to drive out the oriental invaders. This effected, Kublai Khan established himself in China, and in 1260 assumed the title of emperor of that country. The Sung dynasty, though unable to

make any effective resistance, continued to maintain a nominal existence till 1279, when it was extinguished. Kublai Khan now entered vigorously upon the administration of his empire. Assisted by three wise ministers, Yao-tchu, Hing-heng, and Teou-mo, he reformed the army and the administration of civil affairs, reorganized the tribunals of mathematics and astronomy, and called to his court men of letters from all countries, among them the Venetian merchant Marco Polo. He organized an expedition for the conquest of Japan, but a part of his fleet was overwhelmed by a violent tempest, and the remainder destroyed by the Japanese. The discontent of the nobles and the people at this untoward result admonished the emperor to seek conquests in directions where they might be more easily won, and he subjected to his sway Tonquin and Cochin China, and reigned as emperor from the Arctic sea to the straits of Malacca, and from the Yellow sea to the Euxine. He seems to have been, for his time and his country, a ruler of extraordinary ability and integrity.

**KUENLUN**, or **Kulkun**, a mountain range of central Asia, forming the N. boundary of Thibet, and separating it from East Turkistan, the desert of Gobi, and the Koko-nor territory. It runs from W. to E. on or near the parallel of 36° N., until near lon. 92° E. it is broken by the irregular mountain groups around Lake Koko-nor. The Nan-shan and Kilian-shan ranges may be considered as its eastern prolongations. At the W. end it is connected with the Hindoo Koosh, near its union with which it is attached on the north to the Belur Tagh, a great chain running N. and S. along the E. frontier of Independent Tartary. The Karakorum range, with which the Kuenlun is often said to be linked, is really a distinct branch of the Himalaya. The loftiest summits attain a height of 22,000 ft. The mountain of Shinkhieu in the Kuenlun chain is remarkable for a cavern emitting continual flames which diffuse for some distance an agreeable odor, probably from naphtha; it is not a volcano, but a fire spring. The highest watershed, according to the brothers Schlagintweit, who crossed the Kuenlun in 1856, is near the Karakorum pass, the elevation of which is 18,345 ft. The rivers Yarkand and Karakash take their rise near this pass.

**KUGLER, Franz Theodor**, a German author, born in Stettin, Jan. 19, 1808, died in Berlin, March 18, 1858. His *Skizzenbuch* (1830) contained original compositions in poetry, music, and linear design, and in 1833 he published with Reinick a *Liederbuch für deutsche Künstler*. The history of mediæval art, however, occupied him chiefly, and after a visit to Italy for the purpose of collecting materials, he published in 1837 his *Handbuch der Geschichte der Malerei von Konstantin dem Grossen bis auf die neuere Zeit* (2 vols.), the most comprehensive treatise on the subject which has yet appeared. The approbation with which

the work was received caused it to be almost immediately translated into the leading languages of Europe. In England it appeared in three separate parts, of which that relating to the Italian schools was translated by Lady Eastlake, with notes by Sir Charles Eastlake; and those comprehending the German, Dutch, and Flemish schools, and the French and Spanish schools, were edited by Sir E. W. Head. Kugler also published works on "The Polychromy of Greek Architecture and Sculpture, and its Limits," the "Art Treasures in Berlin and Potsdam," "History of Architecture," "Schinkel, the Influence of his Theories of Art," &c. He was almost equally industrious in other walks of literature, having published a "History of Frederick the Great," illustrated by Menzel, a "Modern History of Prussia," a volume of poems, and several successful dramas. From the year 1833 he was professor of the history of art in the royal academy of Berlin, and for 20 years lectured in the university of Frederick William.

**KUHN, Adalbert**, a German philologist, born at Königsberg, Brandenburg, Nov. 19, 1812. He studied in Berlin under Bopp, Böckh, and Lachmann, and became in 1841 teacher and in 1856 professor at the gymnasium of Cologne. He acquired celebrity in comparative philology and as the founder of the science of comparative Indo-Germanic mythology. His principal works are: *Zur ältesten Geschichte der indogermanischen Völker* (Berlin, 1845; enlarged in Weber's *Indische Studien*, Berlin, 1850); *Die Herabkunft des Feuers und des Göttertranks* (1859); and *Sagen, Gebräuche und Märchen aus Westphalen* (2 vols., Leipsic, 1859). He is the editor of a periodical devoted to the comparative philology of the French, Greek, and Latin, and edits with Schleicher a similar publication relating to the East-Aryan, Celtic, and Slavic languages. He has written numerous essays for these periodicals, and many on German mythology and legends in other regions.

**KÜHNE, Gustav**, a German novelist, born in Magdeburg, Dec. 27, 1806. He graduated as doctor of philosophy in Berlin, and has published several novels, of which his *Klosternovellen* (Leipsic, 1838) and *Die Rebellen von Irland* (1840) are the best. His *Deutsche Männer und Frauen* (Leipsic, 1851) is one of his most popular works. He has since published *Skizzen deutscher Städte und Landschaften*, and a novel entitled *Missionär und Proselyt*. He belongs to the "Young Germany" school of politicians and writers, and has done much to promote the establishment of kindergartens after the plan of Froebel, and published on the subject *Fröbel's Tod und der Fortbestand seiner Lehre* (Liebenstein, 1852). He purchased from Lewald the magazine *Europa* in 1846, and continued it till 1859. In 1852 he removed to Dresden. His recent publications comprise *Mein Tagebuch in bewegter Zeit* (Leipsic, 1863), and a collection of his works (7 vols., 1862-'6).

**KÜHNER, Raphael**, a German philologist, born in Gotha, March 22, 1802. He studied in Göttingen, and became in 1824 teacher of Latin and Greek at the lyceum of Hanover. His Greek and Latin grammars and translations have become text books in German, English, American, and Scandinavian schools. The principal of them are: *Ausführliche Grammatik der griechischen Sprache* (2 vols., Hanover, 1834-'5; latest ed., 1869-'71); *Kurzgefasste Schulgrammatik* (1836; 25th ed., 1869); *Elementargrammatik* (1837; 29th ed., 1868); and similar works relating to Latin.

**KUKOLNIK, Nestor**, a Russian author, born in 1808. He was employed in the civil service, and retired with the title of actual councillor of state. He became known in 1833 by his drama "Torquato Tasso," and in 1840 by a tragedy with choruses for which Glinka composed the music. His tragedy "Patkul" was favorably received in 1846, and the Crimean war suggested to him two plays, the "Naval Festival of Sebastopol" and the "Siege of Azov." He has also written many historical novels and stories, one of the most recent of which, "The Two Sisters" (St. Petersburg, 1865), relates to the Polish insurrection.

**KULJA. I.** A province of the Russian government general of Turkistan, in central Asia; area, 27,500 sq. m.; pop. in 1871, 114,337. After the expulsion of the Chinese from the basin of the Ili, this region was for a time ruled by the sultan of the Taranji, who resided in the town of Kulja. Hostile demonstrations of the sultan against the Russian frontier led, in May, 1871, to a Russian expedition, which on July 3 ended with the submission of the sultan. The country was organized as a Russian province, and provisionally divided into four circles. **II.** A town, also called Ili, capital of the province, formerly the capital of Dzungaria, the northwesternmost dependency of China, but since 1871 occupied by and annexed to Russia; pop. about 30,000. It is situated on the Ili, about 350 m. E. of its mouth in Lake Balkash, and has long been one of the centres of the transit trade of central Asia.

**KULM** (Boh. *Chlumec*), a village of Bohemia, in the circle of Leitmeritz, 8 m. N. E. of Teplitz, noted for a battle between the allies and the French, Aug. 29-30, 1813. After his victory at Dresden (Aug. 27) Napoleon was marching upon Silesia, when Schwarzenberg's advance from Bohemia made him retrace his steps, and he despatched Vandamme with 30,000 men to frustrate the enemy's design. Schwarzenberg was obliged to fall back upon Teplitz, and the allies were only extricated from a dangerous dilemma through the valor of the Russian general, Duke Eugene of Würtemberg; but the latter would have been overwhelmed on Aug. 29 in the valley of Kulm, if his division had not made a most desperate resistance, and if the king of Prussia, on hearing of the emperor Alexander being on the battle field, had not sent reinforcements. These en-

abled the allies to maintain their position at Arbesau near Kulm. As the night approached Vandamme encamped in the vicinity of Kulm, anticipating the arrival of Napoleon, or at least of Marshal Mortier; but the former had already left for Pirna, and both were soon obliged after the defeat at Grossbeeren to return to Dresden. The French were on the following day surrounded by the allies, who had been placed by Schwarzenberg under the command of the Russian general Barclay de Tolly. The left wing, which occupied the heights of Kulm, was turned early in the day, while Kleist attacked the French in the rear from the direction of Nollendorf. After a futile attempt to cut his way through to the latter place, Vandamme was obliged to surrender with three other generals and 10,000 men as prisoners of war, after having lost 5,000 men and over 80 pieces of artillery.

**KULM**, a town of Prussia. See **CULM**.

**KUM**, or **Koom**, a town of Persia, capital of a district of the same name in the province of Irak-Ajemi, 78 m. S. by W. of Teheran. It is important from its situation on the high road between the N. and S. portions of the country. Anciently it was a place of great magnificence, and had a population of 100,000; the number is now only about 8,000. Portions of the town are in ruins, it having been destroyed by the Afghans when they invaded Persia in 1722. Within its walls is the tomb of Fatima, a near descendant of the prophet, who is believed to have an intercessory influence. Her tomb is covered with plates of gold, and the city is on her account one of the most favorite burial grounds in the country. The bazaars are numerous and extensive. There are manufactures of chinaware of inferior quality, of pottery, and of jars for cooling water, which are much esteemed. The town is supposed to occupy the site of the ancient Choana, and to have been built early in the 9th century, from the ruins of seven towns, which composed a small sovereignty under an Arabic prince.

**KUMANIA**. See **CUMANIA**.

**KUMAON**, a district of the Northwest Provinces in British India, bordering on the Himalaya mountains, Nepaul, Rohilcund, the Dehra Doon, and the district of Gurwhal; area, about 7,000 sq. m.; pop. in 1872, 430,300. The surface is very diversified. The southern portion is either forest-clad plain almost destitute of water, or marsh land, while toward the north the surface is broken by numerous mountains, some of which are among the highest in the world. The climate in the low region is sultry and deadly; in the alpine districts, temperate, invigorating, and healthful. Earthquakes are common. The principal rivers are the Kalee, Goonka, Aluknunda, Surju, and Gorigunga. The valleys and low lands are fertile, and in the warmer districts yield two crops annually. The tea shrub has been successfully introduced. The chief mineral productions are gold, lead, copper, and iron. The

gold is chiefly found in the sands of the Alukunda. The principal manufactures are blankets, coarse linens and cottons, and bamboo mats and baskets. A large portion of the inhabitants are engaged in the transit trade between East Turkistan and India. A corrupt form of Brahmanism is the dominant faith. Kumaon is famous for the number of its shrines and temples, mostly situated at the confluence of its rivers. Those most celebrated as places of pilgrimage are Kedarnath, Badrinath, Deoprayag, Rudraprayag, and Vishnuprayag. Kumaon was never conquered by the Moguls, but was subdued by the Gorkas in the latter part of the 18th century. It became a British province in 1815. Capital, Almorah.

**KUMISS**, an alcoholic liquor distilled by the Calmuck Tartars from mares' milk as it is undergoing fermentation. It is said that 21 oz. of milk yield 14 oz. of low wines, which by rectification give 6 oz. of pretty strong alcohol. Cows' milk, probably from its containing less saccharine matter, yields much less spirit.

**KUNERSDORF**, a village of Prussia, near Frankfort-on-the-Oder, noted for a battle fought Aug. 12, 1759. After the failure of Gen. Wedel (July 23) to prevent the junction of the Russians and Austrians on the Oder, Frederick instructed Prince Henry to replace him in watching the main Austrian army under Daun, while he crossed the Oder and gave battle to the allies. Despite a furious fire, he stormed the Mühlberg, turning the Russian left wing, and considered the day his, when, owing both to the difficulties of the ground and the wearied condition of his troops, with whom he now assailed the strongly posted right wing, the tide turned in favor of the allies. The latter, out of an army variously estimated at from 60,000 to 90,000, lost 18,000, and according to some authorities 24,000; while the Prussians, out of an army of 40,000 to 50,000 men, lost in killed and wounded 19,000, or according to others 26,000, and almost all their batteries. Gen. Puttkammer and the poet Chr. Ewald von Kleist fell. Frederick had two horses shot under him, and escaped capture only through one of his officers. The principal Russian commander was Soltikoff, and the victory was chiefly decided by the panic created among the Prussians by the Austrian general Laudon's impetuous cavalry attack on their flank.

**KUNG, Prince** (KUNG-CHEN-WANG), a Chinese statesman, born in 1835. He is the brother of Hien-fung, emperor of China from 1850 to 1861, and the uncle of Tung-che, the present ruler. On the death of Hien-fung, almost immediately after the close of the war against England and France, the heir to the throne was a child seven years old. In the regency which was at once established, Prince Kung, who had previously occupied a high official position at court, but had not been an active member of the executive government, received a power nominally equal to that of the young emperor's mother and aunt, who were asso-

ciated with him; but he immediately became recognized as the actual head of affairs, and, though frequently hampered in his action by the opposition of his two companions in power, he continued to be *de facto* ruler until the emperor attained his majority, Feb. 23, 1873. His policy was throughout this period enlightened and progressive, and whatever advance was made in the political improvement of China and her relations with foreign powers is undoubtedly chiefly due to him; while he consistently opposed all conservative action and the policy of seclusion previously practised. Many of the more liberal treaty stipulations, the establishment of a college at Peking, and the sending of an embassy to foreign powers in 1868, were largely owing to his efforts. After the accession of the emperor, Prince Kung remained at the head of the foreign office.

**KUNTH, Karl Sigismund**, a German botanist, born in Leipsic, June 18, 1788, died in Berlin, March 22, 1850. Alexander von Humboldt enabled him to study in Berlin, and he joined him in Paris in 1813 to continue, after Willdenow's death, the editing of Humboldt and Bonpland's botanical collection. He returned to Berlin in 1819, and became professor of botany and vice director of the botanical garden. His works include *Nova Genera et Species Plantarum* (7 vols., Paris, 1815-'25), and *Enumeratio Plantarum omnium hucusque cognitarum* (5 vols., Stuttgart, 1833-'50); and he continued Bonpland's monographs of melastomæ and equinoctial plants, altogether including 6,000 specimens.

**KUOPIO. I.** A S. län or government of Finland, Russia; area, about 17,000 sq. m.; pop. in 1871, 222,321, mostly Lutherans. A large part of the surface is occupied by lakes, and the rest consists generally of large sandy plains, diversified by hills and forests. The Vuoxen traverses the län, flowing southward into Lake Saima and thence eastward into Lake Ladoga. The principal occupations are rearing of cattle and horses, agriculture, and fishing. **II.** A town, capital of the län, pleasantly situated on a W. promontory of Lake Kalla, 225 m. N. W. of St. Petersburg; pop. about 5,000. It contains a church and a gymnasium, and exports resin and timber. The periodical fairs are numerously attended.

**KUR, Koor, or Kura** (anc. *Cyrus*), a river of Russian Georgia, which rises in the mountains W. of Kars, in the Turkish vilayet of Erzerum. It flows N. E. into Transcaucasia until it approaches the S. base of the Caucasus, when it turns E. S. E. and runs nearly parallel with that range to the Caspian sea, which it enters by three mouths 80 m. S. S. W. of Baku. It is about 800 m. long, and navigable 66 m. from its mouth by small vessels. Its banks are high, and well wooded except near its mouth. Its waters are yellowish and turbid, and the current, though smooth, is rapid. Its principal affluents are the Aras and Alazan. Gori and Tiflis are on its banks.

**KURDISTAN**, or **Koordistan** ("the country of the Kurds"), an extensive region of western Asia, comprised chiefly within the basin of the Tigris, between lat. 34° and 39° N., and lon. 39° and 47° E., and belonging partly to Turkey, partly to Persia; area, about 40,000 sq. m.; pop. estimated by Ritter at 800,000, by others as high as 3,000,000. Its limits are not well defined. Persian Kurdistan is comprised chiefly in the province of Irak-Ajemi, and the Turkish in the vilayet of Diarbekr. Mountain ranges from 3,000 to 13,000 ft. in height, of which many peaks are covered with snow during six months in the year, occupy the north, breaking the surface into deep, narrow valleys, and rugged table lands, of which the most extensive are on the confines of Armenia. With the exception of three ranges of hills of no great altitude, the southern portion of the territory is low and level. The principal rivers are the Tigris, the Great Zab (the Zabatus or Lycus of ancient Assyria), the Little Zab (the ancient Caprus), the Diyalah, and the Adhem. There are several lakes, of which the most considerable are Van and Urumiah. The soil is very fertile. The climate ranges from extreme heat to extreme cold; the winters in the north are very severe, and the summers in the south are attended by an equally intense heat. The country has but little mineral wealth, but alum, sulphur, and iron are found, and there are a number of salt springs. Forests of oak, pine, and plane trees clothe the mountains; grains of all kinds, rice, tobacco, flax, and hemp, excellent wines, and the usual fruits of temperate climates, thrive on the hills and plains. Mulberry trees, for silkworms, are cultivated. Cotton is found to succeed in certain localities. A remarkable vegetable production is found here, answering in most respects to the manna which fed the children of Israel in the wilderness; it is collected from leaves of trees and occasionally from the ground, and is dried, pounded, and eaten as a sweetmeat. The gigantic rose is a floral production peculiar to the country. Vegetables of all kinds, especially melons and cucumbers, grow to extraordinary size. Honey is produced largely. Medicinal plants, especially gall nuts of superior quality, are largely exported, by way of Alexandretta and Smyrna. Agriculture employs little attention or skill. Flocks and herds constitute the wealth of the inhabitants. The horses are small, but capable of great endurance, and are much in demand for the Turkish and Persian cavalry. They are worked under the saddle only, oxen being the beasts of draught. Camels are little used, owing to the broken nature of the ground. The live stock chiefly consists of long-tailed sheep, with wool of the most delicate fibre. The principal wild animals are the panther, bear, lynx, jackal, hyæna, and fox. Many varieties of game abound.—The Kurds are supposed to be descendants of the ancient Carduchi. (See **CARDUCHI**.) Their complexion is light, and

their physiognomy animated. Sharp but delicate features, an ample and open forehead, deep-set, dark, and intelligent eyes, a finely cut mouth shaded by a moustache, good teeth, small and handsomely shaped hands and feet, and a well proportioned frame, give to them a remarkable elegance of person; while their active habits impart a strength of body which renders them physically one of the finest people of Asia. They are good horsemen, expert in the use of arms, adventurous and daring, inclined somewhat to brigandage, but hospitable. The young women are very beautiful, but the shrivelled look of age comes upon them very early. The national costume resembles that of the Turks. The men wear a cloak of black goats' hair, and a red cap around which is wound a silk shawl falling down upon the shoulders. Only the aged wear beards. The women, except a few of the highest rank, do not veil; they are treated with more respect than in most eastern countries. The Kurds lead partly a stationary and partly a nomadic life. They occupy stone dwellings, of which those of the wealthy are crowned with a tower. The beys or chiefs retire in time of danger with their tribes into a kind of fortifications constructed in the crevices of steep mountains. The chiefs have a despotic control over their tribes, and are almost constantly at war with each other. The recently perfected political division of the countries of Asiatic Turkey have resulted in a more complete recognition of the authority of the sultan, though the chieftainships of the emirs, khans, beys, and aghas still continue among them. The Persian tribes are considered the wildest of all, and maintain their independence with better success than those in the territory of Turkey. They are divided into three totally distinct classes or castes: warriors (*sipahs*), cultivators (*rayahs*), and villagers (*koilû*).—The language of the Kurds belongs to the Iranian section of the Indo-European family. It is closely related to the Neo-Persian, and may be considered a dialect of it. But though the grammatical structure is Iranian, the vocabulary is strongly mixed with Turkish, especially in the eastern Kurd dialects, and is also full of Arabic words, owing in a measure to their adoption of the Mohammedan religion. It is written with the Persian-Arabic alphabet, but as few Kurds learn to write, it has no literature except songs. As the Kurds appear to be one of the earliest Indo-European tribes which migrated to S. W. Asia, the language is particularly deserving of study. The numerals from 1 to 10 are: *yek, du, seh, tchar, besh, shesh, haft, hasht, nah, dah*. Some of the pronouns are: *me, meh*; they, *tah*; my, *men*; our, *mah*. These pronouns are added to the words by means of connecting vowels, as *bahb, father; bahbehmen, my father; bahbehtah, thy father; bahbehmah, our father*. The literature of the Kurds is as well represented as it can be by a rich collection of manuscripts at Erzerum.

Sheikh Ahmedi is a celebrated poet of the 16th century, and his best production seems to be a love story entitled *Nem-u-Zine*. The names of Mollah Hezir, also called Neali Effendi, and of Ahmed Effendi, are those of the most learned Kurds of modern times. A grammar and vocabulary of the Kurdish language was prepared by Garzoni (Rome, 1787). Rödiger and Pott have written *Kurdische Studien*, in vols. iii. and iv. of the *Zeitschrift des Morgenlandes*; the structure of the language has been described by Dorn and Schafy, *Beiträge zur Kenntniss der iranischen Sprachen* (St. Petersburg, 1866).—In religion the majority of the people profess to be Mohammedans of the sect of Omar, but their creed is tinctured with remnants of the old Manichæan and Magian systems, and they have many superstitious practices not sanctioned by the Koran. About 100,000 are Nestorian Christians, locally known as Kaldani. (See NESTORIANS.) These Christians inhabit the valley of the Tigris and the mountains which skirt it on the east. There is a church and priest in almost every one of their villages.

**KURILE ISLANDS**, a chain of small islands in the Pacific ocean, extending from the S. extremity of Kamtchatka to Yezo, the northernmost of the Japanese islands. They lie between lat. 42° and 51° N., and lon. 145° and 157° E., are 26 in number, and reach over a space of more than 700 m. in length. They are divided into the Great Kuriles, which belong to Japan, and the Little Kuriles, which are subject to Russia. The largest of the former are Kunashir and Iturup; of the latter, Sumshu, Poromushir, Onokotan, and since 1856 also Urup. The surface of these islands is very irregular. There are eight or ten volcanoes, still for the most part in a state of ignition. The height of the northernmost of them, on the island of Alaïd, known for its great eruptions in the years 1770 and 1793, is calculated at from 12,000 to 15,000 ft. The shores are in general rocky and precipitous, and, in consequence of the violent currents which prevail around them, very difficult of access. Several of the Kuriles are uninhabited, and several uninhabitable for want of water; but many are fertile, well wooded, and produce game and fish in abundance. The climate is tempestuous, severe, and foggy. The vegetable productions are few and unimportant. The principal animals are bears, wolves, foxes, sables, otters, seals, and fowl. The chief commerce is carried on with Russia, China, and Japan. The minerals are iron, sulphur, and copper. The people, very few in number, are in general of low stature, dark complexion, and more hairy than the other races of E. Asia. Their habits are excessively filthy, but their disposition is honest and gentle. In manners and customs the northern islanders resemble the Kamtchatdales; the southern, who are termed Ainos, to some extent the Japanese. (See AINOS.) The islands were first discovered by the Russians in 1713;

five of them were known in 1720, and the whole archipelago in 1778.

**KURRACHEE**, or **Karachi**, a seaport town of Sinde, India, in the presidency of Bombay, capital of a district of the same name, 91 m. S. W. of Hydrabad; pop. about 30,000. It is situated on a bay of its own name in the Indian ocean, W. of the delta of the Indus, and near the frontier of Beloochistan. It is built on a plain between the sea and a range of mountains, and has a spacious harbor, obstructed however by a bar which cannot be safely crossed by vessels drawing more than 16 ft. of water. A mole has been built by the British, and a road constructed from it to the town, which is about 3 m. distant. The point of Munorah, at the extremity of a promontory S. of the harbor, is fortified. As the only safe port in Sinde, Kurrachee is an important commercial centre, and it is the terminus of the Sinde railway, which connects it with Kotree, opposite Hydrabad on the Indus. A submarine telegraph gives it communication with Muscat and Alexandria. Kurrachee has warehouses, banks, and other requisites of a large trade, and maintains regular steam communication with several towns in India, Persia, Africa, and Europe. The annual imports and exports are estimated at \$30,000,000. It exports camels, fish, hides, tallow, ghee, oil, oil seeds, bark, saltpetre, salt, indigo, cotton, and grain, and imports metals, hardware, cotton, silks, twist, and yarn, besides having an active transit trade with Cashmere, Afghanistan, Thibet, and Turkistan. It contains an English church and school.

**KURSK. I.** A S. government of Russia, bordering on the governments of Orel, Voronezh, Kharkov, Poltava, and Tchernigov; area, 18,890 sq. m.; pop. in 1867, 1,866,859. The surface is in general undulating, the climate mild and dry, and the soil fertile. The principal rivers are the Seim, Vorskla, and Oskol. The most valuable minerals are iron, limestone, and nitre. The manufactures consist of coarse cloths, leather, soap, spirits, and earthenware. The most important cities are Kursk, Rylsk, Belgorod, Stary-Oskol, Mikhailovka, and Miropolie. **II.** A city, capital of the government, on the Tuskar, a tributary of the Seim, 280 m. S. by W. of Moscow; pop. in 1867, 28,921. It is a large town, with narrow, ill-paved streets, numerous churches, and a magnificent edifice occupied by the government. It carries on a considerable trade with St. Petersburg and Moscow, and is the seat of the civil and military governors of the province, and of the archbishop of Kursk and Belgorod.

**KURZ**, **Heinrich**, a German author, born in Paris, April 28, 1805, died in Aarau, Switzerland, Feb. 24, 1873. He graduated at Leipsic, and after the revolution of 1830 became a journalist at Munich, where he was imprisoned during two years for political offences. From 1834 to 1839 he was professor at St. Gall, Switzerland, and after losing this post on account of being a Protestant and alien, he re-

ceived a professorship at Aarau. He published popular manuals of German poetry (3 vols., Zürich, 1840-'43) and prose (3 vols., 1845-'6). Among his works are *Geschichte der deutschen Literatur* (4 vols., Leipsic, 1851-'72), *Leitfaden zur Geschichte der deutschen Literatur* (1860; 4th ed., 1872), *Deutsche Bibliothek* (10 vols., 1862-'8), and *Bibliothek der deutschen Nationalliteratur* (125 numbers, Hildburghausen, 1867-'72).

**KUSKOQUIM RIVER.** See ALASKA.

**KÜSSNACHT**, a village of the canton of Schwyz, Switzerland, at the foot of the Rigi, on a N. arm of the lake and 8 m. N. E. of the city of Lucerne, at the bottom of the bay of Küssnacht; pop. in 1870, 2,853. It is celebrated for its association with William Tell. Near it is the ruined wall called Gessler's castle, although it has been discovered that it never belonged to him; also the hollow way, referred to in Schiller's drama of "Tell," through which the Swiss patriot shot Gessler with his unerring arrow. The hollow way has almost disappeared through the building of a new road. At the end of the lane stands Tell's chapel, which was originally dedicated to the "Fourteen Helpers in Need" (the Saviour, the Virgin, and the apostles).—There is another village of the same name on the lake and 4 m. S. E. of the city of Zürich; pop. about 2,500.

**KUSTENDJI**, or **Küstendjeh**, a town of European Turkey, in the Dobrudja, the N. E. part of the vilayet of the Tuna (Danube), 70 m. E. by N. of Silistria, on the Black sea; pop. about 5,000. It stands upon a level but elevated point of land, which almost assumes the form of a peninsula, near the termination of Trajan's wall, of which traces still exist. The port of Kustendji is shallow, but affords safe anchorage during the summer. The town was called Con-

stantia in ancient times, after a sister of Constantine the Great, who built it, and is still called Kostantza by the modern Greeks. A railway, about 35 m. long, here connects the Danube with the Black sea, and has greatly increased the prosperity of the town. Inscriptions and other remains of the ancient city of Tomi, where Ovid died, have recently been found in the vicinity of Kustendji.

**KÜSTRIN**, or **Cüstrin**, a town of Prussia, in the province of Brandenburg, near the junction of the Warthe with the Oder, which is spanned by a bridge about 900 ft. long, on the railway from Berlin to Dantzic, 48 m. E. of the former city; pop. in 1871, 10,122, exclusive of the garrison. It is a fortress of the third rank, and contains three suburbs, a royal palace, two churches, a gymnasium, and several other schools. In the vicinity are many sugar refineries, and the local and coasting trade is active. It was founded early in the 16th century, and became the capital of the Neumark and of the margrave John, known as John of Küstrin and as John the Wise, a zealous reformer, who built the fortress and the palace, covering the latter with copper. Frederick the Great, while crown prince, was confined here for a time by his father; and Lieut. Katt, his intimate friend and alleged accomplice in his proposed flight to England, was beheaded here, Nov. 6, 1730. The fortress was bombarded by the Russians, Aug. 15-22, 1758, and saved only from utter destruction by Frederick the Great. Soon after the battle of Jena (1806) the Prussian commander hastily surrendered it, though it had sufficient provisions to hold out for a long time; and the French occupied it till early in 1814, when they capitulated.

**KUTAIEH**, or **Kutaya**, a town of Asiatic Turkey, capital of a district of the same name in

Kutayah.

the vilayet of Khodavendighiar, 170 m. N. E. of Smyrna, on the Kutaieh-su, the principal

upper branch of the Pursak; pop. about 60,000. It is the centre of the district where

the famous Turkish carpets are manufactured, and of a considerable trade and industry, the surrounding country being extremely productive in grain, cotton, gall nuts, fruits, goats' hair, and wool. The town possesses about 30 mosques, three Armenian and Greek churches, fountains, baths, bazaars, and fine private residences with gardens attached to them. A treaty of peace was concluded here in 1833 between Mehemet Ali and the Porte. Kossuth was confined here by the Turkish government in 1850-'51. In the town is an old castle built on the site of the ancient Cotyæum, a town of Phrygia.

**KUTAIS.** I. A government of Asiatic Russia, in Caucasia, bordering on the Black sea and Asiatic Turkey, and embracing the territories of Mingrelia and Imerethia; area, 8,039 sq. m.; pop. in 1871, 605,691. Most of the surface is mountainous. The principal rivers are the Ingur and the Rion, the ancient Phasis. About one sixth of the inhabitants are Moslems. II. A town, capital of the government, on the Rion, 115 m. W. N. W. of Tiflis; pop. in 1867, 8,263, mostly Armenians and Jews. It has a gymnasium, several bazaars, and an important trade in corn, wine, silk, and cattle. Near it, on a hill, are the ruins of the ancient fortress, which in 1770 was destroyed by the Russians. Kutais is built on the site of the ancient Cutatisium or Cytæa, the capital of Colchis and the birthplace of Æetes and Medea. It was formerly the capital of the province of Imerethia, which belonged to Georgia.

**KUTTENBERG** (Boh. *Kutna hora*), a town of Bohemia, 38 m. E. S. E. of Prague; pop. in 1870, 12,747. It has several churches and monasteries, an *Oberrealschule*, manufactories of beet sugar, and important lead mines. Formerly the mines also yielded a considerable amount of silver ore, and in 1300 the first silver groschens were coined here. On Jan. 6, 1422, the town was burned down by the Hussites.

**KUTZOFF, Mikhail**, prince of Smolensk, a Russian general, born in 1745, died in Bunzlau, Prussian Silesia, April 28, 1813. He commenced his military career at the age of 16, and distinguished himself in the campaigns in the Crimea, in which he was several times severely wounded. In 1783 he became a general of brigade, in 1784 a major general, and in 1790 he led under Suvaroff the assault against Ismail, at the taking of which 30,000 Turks were put to the sword. In 1791 he was made lieutenant general, and shared in the victory over the Turks at Matchin, which led to the treaty of Jassy. He was ambassador to Constantinople in 1793, and subsequently filled important military and diplomatic stations under Catharine II., Paul, and Alexander. In 1805 he entered Germany with 50,000 men to form a junction with the Austrians, and gave the corps of Mortier a decided check at Dürrenstein, thereby temporarily deranging Napoleon's plans, for which he received from the emperor of Austria the grand cordon of Maria

Theresa. He was present at Austerlitz in command of the allied forces, but was not responsible for the disaster of the day, having dissembled entirely from the plan of the cross march to outflank the French. In the subsequent war with Turkey he gained fresh laurels, and concluded an advantageous peace at Bucharest in May, 1812. In August of the same year he was appointed to supersede Barclay de Tolly in command of the Russian forces opposed to the grand army led by Napoleon against Moscow. On Sept. 7 he hazarded a battle at Borodino against the whole French army led by Napoleon in person. Although the issue of that conflict was in favor of the French, the Russians losing 52,000 men, and being obliged to resign Moscow, the national pride of the latter was gratified by this obstinate stand against their enemy, who lost 30,000 men, and Kutuzoff received in recompense a field marshal's baton. He subsequently concentrated his forces at Tarutino, midway between Moscow and Kaluga, and watching his opportunity routed the French advanced guard under Murat and Poniatowski at Vinkovo, Oct. 18. On the 24th was fought the battle of Malo-Yaroslavetz, by which, although the French remained masters of the field, Napoleon was checked in his line of march, and compelled to retreat along the wasted line of the Smolensk road. Following the enemy, Kutuzoff defeated the corps of Eugène Beauharnais at Smolensk, Nov. 16, and on the two succeeding days Davoust and Ney at Krasnoi, capturing 26,000 prisoners and over 200 pieces of cannon, and inflicting a loss of 10,000 men upon the enemy, his own troops losing but 2,000. As a reward for the skilful manœuvres which had brought about these successes, he was created prince of Smolensk. After the passage of the Beresina he pursued the French more leisurely, and upon entering Wilna in December he found the campaign virtually ended, although the pursuit was continued as far as Kalisz, where the Russians paused, in the latter part of January. Having issued from this place a proclamation announcing the dissolution of the confederacy of the Rhine, and calling upon its members to join in the league formed for the deliverance of Germany, he crossed the Oder, and following on the traces of the enemy reached Bunzlau, where his constitution, enfeebled by the rigors of the campaign, yielded to an attack of malignant typhus fever.

**KÜTZING, Friedrich Traugott**, a German naturalist, born at Ritteburg, Thuringia, Dec. 8, 1807. He studied in Halle, explored southern Europe, and became professor at Nordhausen. His principal works relate to the algæ, including *Tabulæ Phycologicae* (Nordhausen, 1845-'71); and in his *Grundzüge der philosophischen Botanik* (2 vols., Leipzig, 1851-'2), he anticipated the doctrines of Darwin.

**KUTZNER, Johann Gottlieb**, a German author, born at Pohlschildern, Feb. 27, 1822, died at Hirschberg, Jan. 5, 1872. He was a teacher

in the latter city from 1848, and published, besides other works, *Die Lehre vom Menschen* (Glogau, 1854); *Die Reise seiner königlichen Hoheit des Prinzen Waldemar von Preussen nach Indien, 1844-'6* (Berlin, 1857); *Geographische Bilder* (2 vols., 1858); *Populäre Erdbildungskunde* (Langensalza, 1858); *Die Weltgeschichte in zusammenhängenden Einzelbildern* (3 vols., Berlin, 1858-'9); *Der illustrierte Rübzahl* (Hirschberg, 1859); *Der Weltfahrer Dr. Kane* (Leipsic, 1860); and *Der deutsch-französische Krieg* (2 vols., Leipsic, 1870-'71). He left in manuscript two volumes of *Naturlehre*.

**KUYP, Albert.** See **CUYP**.

**KWANGSI**, or **Quangsi**, a S. province of China, bordering on the provinces of Yunnan, Kweichow, Hunan, and Kwangtung, and the territory of Tonquin; area, 78,250 sq. m.; pop. about 7,000,000. It is watered by branches of the Tao or Si-kiang. Rice is largely produced along the river banks. Gold, silver, and quicksilver are mined. The mountainous character of the province is unfavorable to agriculture, and the population is less dense than in most other parts of China. Principal town, Wuchow; capital, Kwelin.

**KWANGTUNG**, the most southerly province of China, bordering on the gulf of Tonquin and the China sea, and the provinces of Fokien, Kiangsi, Hunan, and Kwangsi; area, 79,456 sq. m.; pop. about 19,000,000. It is mountainous in the north, but the region near the Tonglong river, the Po-kiang, and Si-kiang and the sea-coast is among the most fertile in China. The province is the centre of the production of sugar, and among the other products are tea, rice, silk, tobacco, and fruits. Lacquered wares, cotton and silk goods, and other articles are largely manufactured. The numerous bays and rivers facilitate commerce, and along the coast are a large number of islands, including that of Hainan. Capital, Canton.

**KWEICHOW**, a S. W. province of China, bordering on the provinces of Szechuen, Hunan, Kwangsi, and Yunnan; area, 64,554 sq. m.; pop. about 5,000,000. It is rough and mountainous, and is one of the poorest parts of China. Cereals, rice, tobacco, cassia, and timber are produced; also copper, iron, lead, and quicksilver. The largest river is the Wu, a tributary of the Yangtse. Capital, Kweiyang.

**KWICKPAK RIVER.** See **ALASKA**.

## L

**L**, THE 12th letter of the Phœnician and other Semitic graphic systems (*lamed*) and of most modern European alphabets, the 23d in Arabic, the 27th in Persian and Turkish, and the 11th in Greek (*λάμδα*), the 12th before the dropping of the digamma and Latin. It is one of the four liquids of grammarians (*l, m, n, r*), and of the four *akshara yavarga* (*ya, ra, la, va*) or semi-vowels in the Devanagari. The sound is produced by placing the tip of the tongue against the upper incisor teeth, while the breath issues at its sides and the larynx vibrates; and it is hence called a linguo-dental. Priscian attributes to the Latin L three sounds, one full, one middle, and one slender. In English, German, and other languages, it has but one sound. The French *l mouillé* (*ly* uttered with one breath, as in *million*) is generally expressed by *ll* following *i*, as in *tilleul*, but sometimes by *l*, as in *cil*, and *lh*, as in *gentilhomme*. The Spanish *ll* always has the *mouillé* sound, even as an initial, and is reckoned as a separate character in the alphabet. It is expressed in Portuguese by *lh*, in Italian by *gl* before *i*, and in Magyar by *ly*, in all positions. The Polish, Ruthenic, and Lusato-Vendic barred *ř* is pronounced by pushing and swelling the tongue to the palate, as in Pol. *řlaski* (Ger. *platt*), flat. The Welsh *ll* is pronounced with a hissing, as in *llán* or *lhn* (temple), *Lloyd*, &c., almost as if written *fl*. Some nations and persons cannot pronounce *l*, as for instance the Japanese, who use *r* in its stead, as in *Sagarien* for Saghalian. The Chinese, on the contrary, unable

to utter *r*, always substitute *l*, as in *Kilisit* for Christ. There was no L in Zend. It is often mute in English before consonants, as in *could, calm, half, psalm*, &c. (although pronounced in similar positions in all other languages), and when final in some French words, as in *baril, outil, sourcil*, in *fil*, &c. In words transferred from one language to another, *l* is often interchanged with *r, n, d, i, or u*; as Eng. *pilgrim* (Lat. *peregrinus*), Fr. *orm* (Lat. *ulmus*, elm), Lat. *lympha* (Gr. *λύμηνη*), *Ulysses* (Ὀδυσσεύς), Ital. *fiore, bianco* (Lat. *flora, blaneus*), Dutch *goud* (gold), &c.—As a numeral sign, L denotes 30 in the Semitic (except Ethiopian, where it marks 2), Greek, Russian, Armenian, Cyrillic, and Georgian; 50 in Latin and Glagolitic (in the former as being a half of the ancient L or C, *centum*). A dash above it raises these values to as many thousands. In rubrication it marks 11. In abbreviations it stands for *Lucius, Lælius, Lares, libens, libertus, locus, latus, libra* (£, pound sterling), &c. L. S. stands for *locus sigilli*, place of the seal; LL. D. for *legum doctor*, doctor of laws. On old French coins L stands for Bayonne.

**LAALAND**, an island in the Baltic belonging to Denmark, lying between lat. 54° 38' and 54° 58' N., and lon. 10° 58' and 11° 53' E.; greatest length 37 m., greatest breadth 17 m.; area, 460 sq. m.; pop. in 1870, 62,000. Together with Falster and several small islands, it forms the district of Maribo (area, 640 sq. m.; pop. in 1870, 90,706). The surface of Laaland is low, level, and mostly marshy. The

water is bad, and the climate unhealthy; but the soil is fertile, and yields good crops of corn, beans, hops, and hemp. There is a lake called Maribo near the centre of the island, which is almost 5 m. in length. There are five towns: Maribo, the capital, Nakskov, Nysted, Rödby, and Sakkjöbing.

**LABADIE, Jean de**, a French mystic, born at Bourg-en-Guienne in February, 1610, died in Altona, Holstein, Feb. 13, 1674. He was educated at the Jesuits' college of Bordeaux, and was for some time a member of that society; but in 1650 he became a Protestant, settled at Montauban, was elected pastor of the church, and remained there eight years, during which he founded a mystical sect, resembling the quietists of his old communion, and called Labadists. Being at length banished from Montauban for sedition, he went first to Orange, and afterward to Geneva, whence in 1666 he was invited to Middelburg, Holland. Here his followers increased in number, and included many persons of rank and education, among whom were Anna Maria von Schurmann and the princess palatine Elizabeth. The heterodoxy and contumacy of Labadie, however, led to his deposition by the synod of Naarden, and to his banishment from the province. He formed a church in a small village near Amsterdam, and established a press for the publication of his works, but was ultimately compelled to remove to Altona. The Labadists do not now exist.

**LABANOFF DE ROSTOV, Alexander**, prince, a Russian author, born in 1788. He was aide-de-camp to Alexander I. and Nicholas from 1813 to 1828, when he retired with the rank of major general. He published numerous works based on official documents relating to Mary Stuart, the principal being *Lettres, instructions et mémoires de Marie Stuart, reine d'Ecosse* (7 vols., Paris, 1844, and a supplementary volume), which are regarded as the most authentic authority on the subject. He presented his valuable library to the government.

**LABARUM**, the military standard of Constantine the Great, adopted by him in commemoration of the appearance of the cross in the sky when he was on the march against Maxentius. It consisted of a pole or pike with a horizontal bar forming a cross, from which depended a square purple banderole, ornamented with fringes and precious stones. The staff was surmounted by a golden crown set with jewels, in the midst of which was the monogram of Christ, with the occasional addition in later times of the Greek letters alpha and omega. On medals of Valentinian I.

Labarum, from a Medal of Valentinian I.

it is represented without the crown and with the monogram on the banderole; and sometimes the figure of Christ was displayed on the latter. Prudentius says that "Christ, woven

in jewelled gold, marked the purple labarum." Julian the Apostate removed the sacred symbols and substituted for them the ancient S. P. Q. R., but Jovian restored them. The origin of the word is involved in obscurity, and scholars are undecided when it was first applied to the Roman standard; but it is found on coins and medals of the first emperors, especially on those connected with the Germanic and Armenian wars. Under the pagan emperors the ensign usually bore the image of the emperor or that of Jupiter, Mars, or Mercury.

**LABAT, Jean Baptiste**, a French missionary and historian, born in Paris in 1663, died there, Jan. 6, 1738. He entered the order of the Dominicans, taught philosophy at Nancy, afterward devoted himself to preaching, and became a missionary to the Antilles. After remaining two years at Martinique, he passed in 1696 to Guadeloupe, where he established a station of his order, and also distinguished himself as an engineer and agriculturist. On his return to Martinique he was appointed *procureur général* of the mission, and for his diplomatic and scientific services was held in esteem by successive governors. He explored the archipelago of the Antilles, founded in 1703 the city of Basse-Terre, and in that year took an active part in the defence of the island against the English. He organized a company of 60 negroes, who, as he said, destroyed more of the enemy than all the French troops. By the decease of his associates, he gradually united in his own person nearly all the higher offices of his order in the Antilles, and in 1705 returned to Europe to obtain recruits. He was detained by his superiors at Rome till 1709, and at Civitá Vecchia till 1716, after which he went to Paris, where he passed the rest of his life. His principal works are: *Nouveau voyage aux îles de l'Amérique* (6 vols. 12mo, 1722); *Nouvelle relation de l'Afrique occidentale* (5 vols., 1728); and *Voyage en Espagne et en Italie* (8 vols., 1730).

**LABANUM**. See LADANUM.

**LA BÉDOLLÈRE, Émile Gigault de**, a French author, born in Paris, May 24, 1814. He has been extensively connected with journalism, was one of the founders of the *Univers illustré*, and from 1850 one of the editors of the *Siècle*, and in 1869 assisted in founding the new *National*. He has written histories of the French campaigns from 1792 to 1815, the Crimean war, the British war in India, the Italian war of 1859, the Mexican war, and the German and Italian war of 1866. His miscellaneous writings comprise almost every variety of literature, including *Histoire des mœurs et de la vie privée des Français* (3 vols., 1847-'9), *La France et la Prusse* (1867), and translations of "Uncle Tom's Cabin," Hildreth's "White Slave," and various novels of Scott, Cooper, Dickens, Marryat, and Mayne Reid, and other works.

**LABEDOYÈRE, Charles Angélique François Huchet de**, count, a French soldier, born in Paris, April 17, 1786, shot at Grenelle, Aug. 19, 1815.

He was aide-de-camp to Lannes and Prince Eugène, and was severely wounded at the battle of Lützen in 1813. In the same year he married a lady of the legitimist Chastellux family, and after Napoleon's first abdication he entered the service of the Bourbons, but was the first to join the emperor after his return from Elba, who made him general and peer. He was one of the last to leave the battle field at Waterloo. Supporting Napoleon II., and excepted from the amnesty, he left Paris, but imprudently returned, and Louis XVIII. had him shot despite the efforts of Benjamin Constant. Napoleon left 150,000 francs to his heirs.

**LABETTE**, a S. E. county of Kansas, bordering on Indian territory; area, 624 sq. m.; pop. in 1870, 9,973. It is drained by the Neosho river and affluents of the Verdigris. The Missouri, Kansas, and Texas railroad passes through it. The chief productions in 1870 were 28,514 bushels of wheat, 128,543 of Indian corn, 32,489 of oats, 13,484 of potatoes, 69,218 lbs. of butter, and 5,956 tons of hay. There were 2,644 horses, 2,538 milch cows, 1,990 working oxen, 5,413 other cattle, 2,910 sheep, and 2,540 swine; 3 manufactories of furniture, 4 of tin, copper, and sheet-iron ware, and 8 saw mills. Capital, Oswego.

**LABIENUS, Titus**, a Roman general, died in 45 B. C. He was tribune in 63, the year of Cicero's consulship, and carried some measures in the interest of Cæsar, who in 58 took him as his lieutenant into Transalpine Gaul, and made him pro-prætor. He served with ability, and commanded the troops during Cæsar's absence. In 54 he twice defeated the Treviri, and reduced them to submission. He took a distinguished part in the great campaign against Vercingetorix in 52, and thought himself not inferior in military ability to Cæsar. On the outbreak of the civil war in 49 he went over to Pompey, but distinguished himself little, except for boastfulness and cruelty. He murdered the soldiers of Cæsar who fell into his hands at Dyrrhachium. After the defeat at Pharsalia he fled, through Corcyra and Cyrene, to the remnant of Pompey's army in Africa. In 46 he commanded an army which was repulsed by Cæsar near Ruspina, after which he served as lieutenant of Scipio. After the defeat at Thapsus he fled to Spain. In 45 he again fought against Cæsar at Munda; his cautious attempt to cover his camp, being mistaken for a retreat, produced a panic, and turned the undecided battle into a rout, in which he fell. He was an able lieutenant, but too vain and headstrong to command.

**LA BILLARDIÈRE, Jacques Julien Houton de**, a French naturalist, born in Alençon, Oct. 23, 1755, died in Paris, Jan. 8, 1834. In 1786 he was sent on a scientific mission to Syria and Palestine, explored the mountains of Lebanon, and brought back a valuable collection of plants. The results of his journey were published in his *Icones Plantarum Syriæ rariorum Descriptionibus et Observationibus illus-*

*tratis* (4to, Paris, 1791-1812), with elegant drawings by Redouté. When the expedition under D'Entrecasteaux was sent in search of La Pérouse in 1791, La Billardièrre sailed on board the *Recherche* as naturalist, spent a few months at the Cape, visited many of the large islands and archipelagos in the Pacific ocean, and was finally taken prisoner at Java by the Dutch in October, 1793. His botanical collections, consisting of 4,000 plants, three fourths of which were of species previously unknown, were carried to England; but when, after a captivity of nearly two years, he returned to his native country, they were returned to him. In 1800 he was elected a member of the academy of sciences, and thenceforth devoted his whole time to arranging his botanical treasures and publishing the results of his observations.

**LABLACHE, Luigi**, an Italian singer, born in Naples, Dec. 6, 1794, died there, Jan. 23, 1858. He was the son of a French merchant, and studied vocal and instrumental music in one of the conservatories of Naples. He was idle and unruly, but was compelled to finish his studies, and made his début in 1812 at the little theatre of San Carlino as a buffo singer. In 1817 he appeared at the Scala theatre in Milan in Rossini's *Cenerentola*, with such success that Mercadante wrote for him the opera of *Elisa e Claudio*, and for several seasons he filled the leading basso parts in that city. In 1824 he sang for the first time before the Viennese, who in their enthusiasm caused a medal to be struck in his honor. After an absence of 12 years Lablache returned to Naples to assume the duties of royal chapelmaster and fill an engagement at the San Carlo theatre, and appeared in the works of Rossini and Bellini. In 1830 he went to Paris and London, where, in the maturity of his powers, he made his début at the Italian opera in the character of Geronimo in *Il matrimonio segreto*. Thenceforth until within a short time of his death, with the exception of the year 1834, when he returned to Naples to sing in the *Elisir d'amore*, he appeared chiefly in Paris and London. During the last 25 years of his life he was the leading basso of his own and perhaps of any other time. His voice, a base of the purest quality, unsurpassed in resonance, in flexibility and compass, was not less remarkable than his artistic skill in the management of it, and his dramatic versatility. Originally of an imposing and graceful presence, he became exceedingly corpulent in middle life, although this never detracted from the impressiveness of his performance in serious parts. He was at one time singing master of the queen of England. His only daughter was married to Thalberg.

**LA BLANCHÈRE, Pierre René Marie Henri Moulin de**, a French naturalist and photographer, born at La Flèche, Sarthe, May 2, 1821. After studying the natural sciences, he established himself in Paris in 1855 as a photographer, with a view of applying that art to scientific purposes. He was president during five years

of the *société du progrès de l'art industriel*, and superintended its semi-annual exhibitions in the Champs Elysées. At a later period he was commissioned by the government to execute photographic illustrations of the various types of French fishes and of the management of the piscicultural establishments at Hünningen and Concarneau; and these he collected in an album, which attracted much attention at the exhibition of 1867. His principal works are: *Répertoire encyclopédique de photographie* (a periodical, 6 vols., 1862-'7); *Nouveau dictionnaire général des pêches* (4to, illustrated); *Les ravageurs des forêts* (1865); *La pêche aux bains de mer*, and *Voyage au fond de la mer* (1868).

**LABORDE, Henri**, viscount de, a French painter, born in Rennes, May 2, 1811. He is a son of Gen. Count Henri François de Laborde (1764-1833). He studied under Delaroche, and produced in 1836 "Hagar in the Wilderness," which is at the museum of Dijon, and in 1837 "The Confession of St. Augustine," one of his best works, which has been purchased by the government. His "Capture of Damietta" (1841) and "Knights of St. John of Jerusalem" (1845) are at Versailles. His "Dante at La Verna" (1847), a historical landscape, for which he received a first medal, was burned in 1870, during the bombardment of Saint Cloud. He has published *Études sur les beaux-arts en France et à l'étranger* (2 vols., Paris, 1864), and *Ingres, sa vie et sa doctrine* (1870).

**LABORDE, Jean Benjamin de**, a French composer, born in Paris, Sept. 5, 1734, guillotined July 22, 1794. While young he became a favorite of Louis XV., and dissipated nearly the whole of his fortune; but he cultivated his taste for music, and during the life of his patron produced several successful operas. He published *Essai sur la musique ancienne et moderne* (4 vols., 1780), and several works on history, chronology, and geography. At the breaking out of the revolution he became obnoxious in consequence of being one of the farmers general, and retired to Rouen, but was brought back to Paris, and executed.

**LABORDE. I. Jean Joseph**, marquis de, a French financier, born at Jaca, Aragon, in 1724, guillotined in Paris, April 18, 1794. He amassed a large fortune in mercantile operations, and rendered important financial assistance to the government, for which he was made court banker and a marquis. When the French took part in the American war, he furnished the king with the money for despatching the troops. He was a friend of Voltaire, whose affairs he managed gratuitously. Toward the end of 1793 he was arrested, and, after a few months' imprisonment, sentenced to death by the revolutionary tribunal, as having participated in the royalist plots for the subversion of the republic. **II. Alexandre Louis Joseph**, count de, son of the preceding, a French archæologist and politician, born in Paris, Sept. 15, 1774, died there, Oct. 24, 1842. He was sent to Vienna at the beginning of the

revolution, entered the Austrian army, reached the rank of major, and returned to France after the treaty of Campo Formio (1797). He then devoted himself to travels and artistic pursuits. In 1800 he accompanied Lucien Bonaparte, ambassador to Spain, and during nearly two years explored the provinces of the peninsula, in company with several artists, whose expenses he paid. On his return to France he undertook the publication of his great work, *Voyage pittoresque et historique de l'Espagne* (4 vols. large fol., 1807-'18), which cost him the better part of his fortune. He afterward held several offices, and was a member of the chamber of deputies for most of the time from 1822 to 1840. He took an active part in the revolution of 1830, and was for some time prefect of the Seine, and afterward aide-de-camp to Louis Philippe. Besides the *Voyage de l'Espagne*, he published *Itinéraire descriptif de l'Espagne* (5 vols. 8vo, with an atlas, 1809); *Les monuments de la France, classés chronologiquement*, &c. (fol., 1816-'26); *Voyage pittoresque en Autriche, avec un précis de la guerre entre la France et l'Autriche*, 1809 (3 vols. fol., 1821-'3), &c. **III. Léon Emmanuel Simon Joseph**, count de, a French archæologist, son of the preceding, born in Paris in June, 1807, died there, March 30, 1869. He studied at Göttingen, travelled in the East, and on his return published, in conjunction with M. Linant, *Voyage de l'Arabie Pétrée* (Paris, 1830-'33), and *Flore de l'Arabie Pétrée* (4to, 1833). In 1837 he began a large and splendid publication, *Voyage en Orient*, consisting of travels in Asia Minor and Syria, which was published in parts and finished in 1862. In 1842 his *Commentaire géographique sur l'Exode et les Nombres* secured his election to the academy of inscriptions. In 1841 he entered the chamber of deputies, where he showed little interest in political questions. In 1845-'7 he published a series of letters on public libraries, the fourth of which, on the Mazarin palace, is full of historical interest. This led him to a larger illustrated publication, *Les anciens monuments de Paris*; the first part was published in 4to in 1846, but it was not continued. He was also the author of the following unfinished works: *Les ducs de Bourgogne, études sur les lettres, les arts et l'industrie pendant le 15<sup>e</sup> siècle* (2 vols. 8vo, 1849-'51); *La renaissance des arts à la cour de France* (vol. i., *Peinture*, 1855); and *De l'union des arts et de l'industrie* (2 vols. 8vo, 1856). He was for several years curator of the antiquities in the Louvre, but resigned in 1854, and in 1857 was appointed director of the archives of the empire. In 1867 he founded the museum of archives in the hôtel de Soubise.

**LABOUCHERE. I. Henry**, Baron Taunton, an English statesman, born in London, Aug. 15, 1798, died July 13, 1869. His father, Peter Cæsar Labouchere, whose ancestors left France at the period of the revocation of the edict of Nantes and became established in Holland, was a partner in the banking house of Hope

and co. of Amsterdam, and settled in England, where he married a daughter of Sir Francis Baring. The son was educated at Oxford, and in 1826 entered parliament as member for St. Michael's. About the same time he visited America, to study the operation of republican institutions, which confirmed his liberal opinions, and he was long recognized as one of the most prominent leaders of the British liberal party. He sat for St. Michael's till 1830, when he was returned for Taunton, retaining this seat by successive reelections till 1859, when he was raised to the peerage. From 1832 to 1834 he was one of the lords of the admiralty, and from 1835 to 1839 vice president of the board of trade, master of the mint, and privy councillor. He was chief secretary for Ireland from 1846 to 1847, president of the board of trade from 1847 to 1852, and from 1855 to 1858 secretary of state for the colonies. As he had no male heir, his title became extinct at his death. **II. Henry Du Pré**, an English politician, nephew of the preceding, born in London in 1831. He was in the diplomatic service from 1854 to 1864, and was a liberal member of parliament from July, 1865, to April, 1866, and from April, 1867, to November, 1868. During the siege of Paris he was correspondent of the London "Daily News," and his letters were published as the "Diary of a Besieged Resident in Paris" (London, 1871).

**LABOUCHERE, Pierre Antoine**, a French painter, born in Nantes about 1818. He completed his studies under Delaroche, and became known as a historical painter, most of his works relating to Luther, Ulrich von Hutten, Melancthon, and Erasmus. Among the more recent ones are "The Death of Luther" and "Charles V." (1866).

**LA BOUÈRE, Antoine Xavier Gabriel de Gazean**, count de, a French painter, born at La Bouère, department of Maine-et-Loire, Oct. 1, 1801. He is a son of a Vendean general of the same name, and was aide-de-camp in Spain in 1823, and in Algeria in 1830. Subsequently he studied painting, and exhibited many pictures under the name of Tancrede de La Bouère, including "Views of Algiers," "Ruins of Thebes," "The Desert of Suez," "The Valley of Tombs in Nubia," "Ruins of Karnak," "The Pontine Marshes," and others, which are in the Luxembourg and some provincial galleries, and the museum at Copenhagen. His "Views of the Alhambra" have been purchased by the government.

**LABOULAYE. I. Édouard René Lefebvre**, a French author, born in Paris, Jan. 18, 1811. He studied law, and became known first by his *Histoire du droit de propriété foncière en Europe depuis Constantin jusqu'à nos jours* (8vo, Paris, 1839). In 1842 he published *Essai sur la vie et les doctrines de Frédéric Charles de Savigny*, and the same year he became an advocate of the royal court of Paris. Two other elaborate works followed, *Recherches sur la condition civile et politique des femmes, de-*

*puis les Romains jusqu'à nos jours* (1843), and *Essai sur les lois criminelles des Romains concernant la responsabilité des magistrats* (1845). In 1845 he was elected a member of the academy of inscriptions, and in 1849 he became professor of comparative legislation in the collège de France. Under the empire Laboulaye took part in various attempts of the liberal party to direct public opinion, and was several times an unsuccessful candidate for the corps législatif. A firm friend of the United States and of republican institutions, he took a deep interest in our civil war, and publicly expressed his sympathy, both in his writings and his speeches, with the federal government. In 1870 he was a member of the commission of inquiry into the administrative organization of the city of Paris and of the department of the Seine, and some weeks before the *plébiscite* of Napoleon he publicly advocated the necessity of an affirmative vote. In July, 1871, he was elected to the national assembly, and was made president of the commission for the reorganization of superior instruction. In March, 1873, he was appointed director of the collège de France. Among his works not already mentioned are: *Histoire politique des États-Unis, 1620-1789* (3 vols. 8vo, 1855-'66); *Les États-Unis et la France* (1862); *L'État et ses limites* (1863); *Paris en Amérique* (18mo, 1863); *Les mémoires et la correspondance de Franklin* (1866); and *Lettres politiques* (1872). He has published also a number of tales and translations, and contributed numerous articles to the leading periodicals. **II. Charles Pierre Lefebvre**, a French industrialist, brother of the preceding, born in Paris in 1813. He entered the army as lieutenant of artillery, but resigned in 1836 and devoted himself to the industrial arts. He turned his attention specially to the founding of metallic type, and he is the inventor of many ingenious and valuable processes and machines for type making. He was also the editor and principal writer of the *Dictionnaire des arts et manufactures* (2 vols. 8vo, 1847; 3d ed., 1867), and the author of a number of valuable treatises on mechanics, industrial art, the mechanical equivalent of heat, &c.

**LABOURDONNAIS, or Labourdonnaie, Bertrand François Mahé de**, a French naval officer, born in St. Malo, Feb. 11, 1699, died about 1755. He entered the service of the French East India company as a lieutenant in 1718, and became a captain in 1724. In 1734 he was appointed director general of the isles of France and Bourbon. These colonies, which he found in a state of anarchy, grew rapidly in prosperity under his government, and became the depots of commerce between Europe and the Indies. He built fortifications, aqueducts, quays, canals, hospitals, and ship yards, and introduced the culture of manioc, sugar, indigo, and cotton. In 1746, during the war between England and France, he improvised a fleet, dispersed the squadron of Admiral Barnet before Madras, and bombarded the city, which sur-

rendered on Sept. 21. The French ministry had given orders that no attempt should be made to hold any of the English possessions that were captured, and the victor agreed to accept a ransom for the city of 1,100,000 pagodas (about 9,500,000 francs); but Duplex, governor general of the French Indies, jealous of Labourdonnais, refused to ratify his act. Labourdonnais was obliged by a storm to put to sea, and Duplex, declaring void the articles of capitulation signed by him, removed all English property to Pondicherry, and burned the city. Labourdonnais, on his return to the isle of France, found a successor installed in his place by Duplex. Returning home, he hoped there to receive justice; but three days after his arrival in Paris, on the night of March 2, 1748, he was seized and thrown into the Bastille, where he lay for three years and a half, ignorant of his accusation and not permitted to communicate even with his family. In 1751 a commission appointed by the council of state pronounced him innocent of all the charges brought against him, and gave him his liberty; but his spirit was broken, and his existence during his last years was embittered by poverty and suffering. The government afterward, recognizing the injustice done him, gave his widow a pension of 2,400 livres. In 1859 a statue was erected to him in the isle of Bourbon (now Réunion). His life was written by his grandson, the actor Bertrand François Mahé (8vo, Paris, 1827).

**LABRADOR**, a peninsula of British North America, on the Atlantic coast, between lat. 49° and 63° N., and lon. 56° and 79° W., comprising in its fullest sense all that territory bounded N. E. and E. by Hudson strait and the Atlantic ocean, S. E. and S. by the strait of Belle Isle (separating it from Newfoundland), the gulf of St. Lawrence, and the river St. Lawrence, S. W. by the Betsiamites or Bersimis river, Lake Mistassini, and Rupert's river, and W. by Hudson bay; extreme length E. and W. from the E. entrance of the strait of Belle Isle, 950 m.; extreme breadth on the 75th meridian, 750 m.; area, about 450,000 sq. m. The E. portion (area about 125,000 sq. m.), from Cape Chudleigh (lat. 60° 37', lon. 65°) at the E. entrance of Hudson strait to the harbor of Blanc Sablon (lat. 51° 25', lon. 57° 9') at the W. entrance of the strait of Belle Isle, embracing the region draining into the Atlantic, belongs to Newfoundland; the remainder forms part of the Dominion of Canada. The portion (area 53,500 sq. m.) immediately W. of a line drawn N. and S. from Blanc Sablon to the 52d parallel, embracing the region draining into the river and gulf of St. Lawrence, forms part of Saguenay co., Quebec; the residue (much the larger part of the peninsula), comprising the N. and W. portions, which drain into Hudson bay and strait, is included in the Northwest territories. In a restricted sense, Labrador includes only the coast washed by the Atlantic. The set-

tled population of the portion belonging to Newfoundland in 1869 was 2,479, of whom 1,803 belonged to the church of England, 483 were Roman Catholics, 165 Wesleyans, and 28 belonged to the Kirk of Scotland. The Quebec portion in 1871 had 3,597 permanent residents, of whom 1,779 were of French origin or descent, and 1,309 Indians (Montagnais). The settlements are scattered along the shore of the St. Lawrence E. through the strait of Belle Isle to Cape Webuck, just N. of Hamilton inlet. W. of the St. Augustine river French is commonly spoken; E. of that point, including the Newfoundland settlements, English is the ordinary language. The chief occupations are fishing in summer, and hunting and trapping fur-bearing animals in winter. There are a few widely separated posts of the Hudson bay company, chiefly near the shores of Hudson bay and strait. In the interior are wandering bands of Nasquapee, Mistassini, and Montagnais Indians, numbering 4,000 or 5,000. The coast N. of Hamilton inlet is occupied by Esquimaux to the number of about 1,500, of whom 1,200 are under the control of the Moravian missionaries, who have four stations here, viz.: Nain (about lat. 56° 30'), founded in 1771; Okkak (lat. 57° 30'), 1776; Hopedale (lat. 55° 40'), 1782; and Hebron (lat. 58°), 1830. Each has a church, store, dwelling for the missionaries, and workshops for the natives. A vessel annually visits Nain from Europe, to bring supplies and carry back the furs and other products collected by the natives. The English church has missions in the settlements subject to Newfoundland, and in 1853 a church was consecrated at St. Francis harbor. Roman Catholic missions have long existed W. of the strait of Belle Isle.—The coasts of Labrador are rugged and forbidding. The chief indentation on the Atlantic is Esquimaux bay or Hamilton inlet (about lat. 54°), into the head of which falls the Ashwanipi or Hamilton, the largest river of Labrador, and the outlet of a lake of the same name. The principal streams emptying into Hudson bay, commencing at the south, are Rupert's river, the outlet of Lake Mistassini, the East Main or Slude river, and the Great and Little Whale. Into Ungava bay, an inlet of Hudson strait, flow the Koksoak or Koniapuscauw and Whale rivers, while the Nasquapee or Northwest river and the Kenamou fall into Hamilton inlet on either side of the Ashwanipi, the former from the north and the latter from the south. Proceeding up the St. Lawrence, the chief rivers that empty into the gulf and river are the St. Augustine, Natashquan, Mingan, St. John, Magpie, Trout, Moisie, and Betsiamites. There are many lakes, formed chiefly by expansions of the rivers. The interior of the country, according to Prof. Hind, is a lofty table land, in many parts thickly strewn with boulders, and everywhere bleak and sterile. Where the surface is not burned, caribou moss covers the rocks, and stunted spruces, birches,

and aspens grow in the hollows. The highest mountains extend along the E. coast from lat. 54° to 59°. Mount Thoresby near the coast is 2,730 ft. high. The prevailing geological formation on the seaboard is granite, gneiss, or mica slate, above which in some places are beds of old red sandstone about 200 ft. thick, and a stratum of secondary limestone. Toward the interior the secondary rocks disappear. At Cape Château a series of basaltic columns presents a remarkable resemblance to an ancient castle. Very little is known of the mineral resources, but iron ore, limestone, granite, hornblende, lapis olaris, hematite, and the beautiful shining spar called labradorite are found, the last being collected by the Esquimaux on the seacoast and the shores of the lakes. In the south a stunted growth of poplars, pines, birch, and willow is found, and grass clothes the valleys for a few weeks in summer. Little vegetation exists in the north excepting mosses and lichens, though in some few favored spots the aspect is better. No kind of grain will ripen, but potatoes, Dutch turnips, cabbages, and other hardy vegetables come to perfection. Much rain falls in summer near the sea. Sometimes on the coast the thermometer in July indicates 86°, but a short distance inland it is at all times more temperate. The winters are extremely cold. From December to June the sea is frozen, while on land travelling becomes almost impossible. The mean temperature of the respective months at the missionary stations of Okkak and Nain is: in January, 1°55'; February, 2°73'; March, 7°88'; April, 29°48'; May, 27°24'; June, 42°59'; July, 50°91'; August, 51°99'; September, 44°71'; October, 32°56'; November, 24°45'; December, 27°84'. The mean annual temperature at Nain is stated at 22°52'; at Okkak, 27°86'; at Hopedale, 27°82'. The prevailing winds on the E. coast vary between W. S. W. and N. W. There is less fog than on the island of Newfoundland, and the strait of Belle Isle is never frozen. The aurora borealis is frequent and of extreme brilliancy. The rivers abound with salmon, and the lakes with pike, barbel, eels, and trout; the wilds with reindeer, black and white bears, wolves, foxes, hares, mountain cats, martens, and otters, with a few ermines, porcupines, and beaver; the birds are white grouse, ptarmigan, spruce game, gray plover, a great variety of water fowl, the white-tailed eagle, and several varieties of hawks. Mosquitoes are as abundant as in more southern climates. Dogs and reindeer are the only domesticated animals, both being used as beasts of draught.—The main wealth of Labrador is in its fisheries, in which, besides the settlers on the coast, a large number of schooners from Newfoundland, the Canadian provinces, and the United States (citizens of which by treaty have the right to take and cure fish on the shore E. of Mount Joly, lon. 61°40', near the mouth of the St. Lawrence river) are engaged, employing during the fish-

ing season probably 30,000 men. According to official reports, the exports from the Labrador coast subject to Newfoundland in 1873 were valued at \$1,132,935, the chief items being 303,208 quintals of codfish, 4,536 gallons of seal oil, 31,004 of cod oil, 1,467 tierces of salmon, and 43,413 barrels of herring. The value of the fisheries of the Quebec portion for the year ending June 30, 1873, was \$518,140, the chief items of catch being 92,800 quintals of codfish, 8,146 barrels of herring, salmon to the value of \$41,135, 7,225 seals, 26,975 gallons of seal oil, 400 of whale oil, and 23,283 of cod oil. These figures do not include large quantities of fish taken to St. John's, Harbor Grace, and other Newfoundland ports, and thence exported to foreign countries, nor the catch of American and Nova Scotian fishermen. It is estimated that the total annual value of the fisheries on the Labrador coast is more than \$5,000,000. The shores and adjacent islets are also resorted to for sea-fowl eggs.—Labrador was discovered by John Cabot in 1497. His son, Sebastian Cabot, who accompanied him in that voyage, subsequently again visited the coast, and entered and partly surveyed Hudson bay, giving names to several places. Henry Hudson explored the coast in 1610, after his discovery of the river which bears his name, passed through the strait now called Hudson strait, and entered the great bay, to which also he gave his name. The Portuguese called the country *Terra Laborador*, or cultivable land, a misnomer equal to that of Greenland. About the middle of the last century a settlement was formed on the coast by Mr. Darby, an American, for the purpose of establishing a whaling station and civilizing the Esquimaux; but the Indians made a descent on it, murdered many of his men, and broke it up.—See "A Journal of Transactions and Events during a Residence of nearly Sixteen Years on the Coast of Labrador," by G. Cartwright (3 vols., Newark, Eng., 1792); and "Explorations in the Interior of the Labrador Peninsula," by Henry Youle Hind (2 vols., London, 1863).

#### LABRADORITE. See FELDSPAR.

**LABRADOR TEA** (*ledum latifolium*), an interesting low evergreen shrub belonging to the heath family, and to the same suborder with the kalmia, the rhododendron, and the azalea. It is found in moist places, from Pennsylvania northward, especially in cold sphagnum swamps, its much-branching stems spreading in every direction through the damp moss. Its alternate short-petioled leaves are light green above, revolute at the margin, and the under surface is clothed with a dense down or rather wool, which in the older leaves is of a rusty brown color, a character by which the plant may be readily recognized; the leaves when crushed are fragrant. The flowers are in crowded terminal corymbs, white with distinct petals, forming an exception to the rule in this family, in which the flowers are mostly monopetalous. The common name has reference to

the use made of the leaves as a substitute for tea by the inhabitants of Labrador. It is found in the northern parts of Europe also, and the leaves are said to be used in Russia for tanning leather, and as a substitute for hops in brewing. The leaves of this and the only other species, *L. palustre*, are said to possess narcotic properties. The writer has found the plant to succeed in cultivation in a soil largely composed of peat.

**LABROUSTE, Pierre François Henri**, a French architect, born in Paris, May 11, 1801. He studied at the collège Ste. Barbe and afterward under Léon Vaudoyer and Hippolyte Lebas, entered the school of fine arts in 1819, and took the grand prize in 1824. In 1843 he began the construction of the new library of Ste. Geneviève, his most noted work and the best existing example of the romantic or neo-Greek style, of which he was one of the founders and the most distinguished master. Among his other works are the hospital of Lausanne, the prison of Alexandria, and the school of Ste. Barbe des Champs.

**LA BRUYÈRE, Jean de**, a French moralist, born in Paris about 1644, died in Versailles, May 11, 1696. At the recommendation of Bossuet he was appointed teacher of history to the grandson of the great Condé, in whose service he remained for the rest of his life in a literary capacity, with a pension of 1,000 crowns. He was admitted a member of the French academy in 1693, and left the reputation of a genial philosopher, whose happiness consisted in cultivating the best society and in reading the choicest books. His power of observation and his literary attainments are attested by his celebrated *Caractères, ou les Mœurs de ce siècle*, founded upon the "Characters" of Theophrastus, which he translated into French and prefixed to his own. Hallam says that he incomparably surpassed his Greek model. The first edition appeared in the beginning of 1688. Three editions were exhausted in the first year of its publication, and six more before the author's death. La Bruyère left also an unfinished work, published in 1699 under the title of *Dialogues posthumes sur le quiétisme*, and contained in an edition of the works of La Bruyère, La Rochefoucauld, and Vauvenargues (Paris, 1820). Many editions of La Bruyère's "Characters" were published after his death in Holland and France. The first complete edition based upon the original work was prepared by Walckenaër (Paris, 1845), followed by an improved edition by Destailleur (1855), and an edition by Gennequin the elder with illustrations (1858). Many have since appeared, the latest being that by Alphonse Lemerre (1872). The English translation by the poet Rowe (London, 1709) has been often reprinted. In 1861 a new edition of his works was published (12mo, Caen), with notes by Georges Mancel.—See *La comédie de La Bruyère*, by Édouard Fournier (Paris, 1866), and *Caractères de La Bruyère*, in

Lemerre's edition of French classics, with a sketch and notes by Ch. Asselineau (1872).

**LABUAN**, a British island in the Malay archipelago, off the N. W. coast of Borneo, in lat. 5° 22' N., lon. 115° 10' E.; area, 45 sq. m.; pop. in 1871, 4,893. The chief settlement is at Victoria at the S. E. end, where there is a government establishment and a fair harbor. In the interior are swampy tracts of jungle. The island is well supplied with water, and good coal is found near the N. E. end. In 1866 about 12,000 tons were mined. Petroleum also is found, and ironstone and freestone are quarried. A railway has been built from the mines to the place of shipment, 5 m. distant, and several new roads have been opened. The chief exports are coal, sago, birds' nests, pearls, and camphor. The exports in 1872 amounted to £134,984 (including £65,890 re-exports); imports, £129,198; total tonnage (exclusive of numerous native craft) entered, 7,708 tons; cleared, 7,808 tons. The colony was created an episcopal see in 1855. The island was ceded to Great Britain in 1846 by the sultan of Brunai, through the influence of Sir James Brooke, the rajah of Sarawak.

**LABURNUM**, the ancient Latin name as well as the popular one for a small, hardy, deciduous tree of the family *leguminosae*. It was formerly placed in the genus *cytisus*, and is found in most works as *C. laburnum*; but some important characters separate it from *cytisus*, and it stands in recent works as *laburnum vulgare*. The common laburnum was introduced from Switzerland into Great Britain near the close of the 16th century, and is now largely cultivated as an ornamental tree. It has a smooth

Laburnum.

green bark, pale green three-foliolate leaves, and in May and June presents a beautiful appearance, every twig and small branch being hung with racemes of brilliant yellow flowers, which are long and pendulous, and suggested one of its common names, golden chain; in

Europe it is also called bean trefoil. Its hard and heavy wood is largely used for ornamental work, and for handles to knives and other instruments; it takes a high polish, and has a greenish color; the French call it the ebony of the Alps. Rabbits are so fond of its bark, that they eat it in preference to that of any other tree. The seeds are highly emetic, and may be regarded as poisonous, and their great profusion and brilliant appearance render it somewhat objectionable to cultivate the tree, from the danger of children or cattle being tempted to eat them. A hybrid (probably a graft hybrid) between this and a purple-flowered species obtained by a French horticulturist, M. Adam, is known as Adam's laburnum. Its flowers, which are of a dull purple color, frequently revert to one or the other parent; and the same branch, and even the same cluster, bears pure yellow and purple flowers of the parent species, as well as the dull purple ones of the hybrid. The alpine or Scotch laburnum (*L. alpinum*) attains a greater size than the one already described; it is a native of southern Europe, and cultivated forms of the two are so much alike that it is probable they are not specifically distinct.

**LABYRINTH**, a structure of intricate passages which it is impossible to traverse without a clue. Three labyrinths are mentioned in ancient story. The best authenticated is the labyrinth of Egypt, situated at Arsinoë, near Lake Mœris. Herodotus visited and describes it. It consisted of 3,000 chambers, half of them below ground, the subterranean apartments being sacred burial places. It was extant in Pliny's time. Ruins at the modern village of Howara in Fayoom have been identified by Lepsius with those of the labyrinth. Another structure, on a smaller scale but on the model of that of Egypt, was reported to have been built near Cnossus in Crete, by Dædalus, as a place of confinement for the fabled monster the Minotaur; but antiquaries discover nothing more labyrinthine in that locality than the caves and quarries of Mt. Ida. A third labyrinth was in the isle of Lemnos; remains of it were extant in the time of Pliny, but none can now be traced. A similar structure was said to exist on the island of Samos, and another, called the labyrinthine tomb of Lars Porsena, near Clusium, in Etruria; but no particulars are known of either, and their existence at any time is doubted.

**LABYRINTHODON** (Gr. *λαβύρινθος*, labyrinth, and *ὄδον*, a tooth), a gigantic fossil reptile, so named by Prof. Owen from the complex labyrinthine structure of the teeth; the same animal had been previously called *cheirotherium* by Kaup, from the resemblance of its tracks to impressions of the human hand. This animal, which possesses both saurian and batrachian characters, probably most nearly resembled a gigantic frog about 10 or 12 ft. long. A historical sketch of the discoveries in connection with this reptile may be found in the "Pro-

ceedings of the Boston Society of Natural History" (vol. v., 1856, p. 298), and full details on its affinities in the "Annals and Magazine of Natural History" (vol. viii., London, 1852, pp. 305-313). Footprints and bones of the labyrinthodon have been found in the trias of England and Germany; from an examination of the head and teeth, vertebræ, pelvis, and bones of the extremities, Prof. Owen constructed an animal intermediate between the crocodile and the frog. Pictet (*Traité de paléontologie*, 1853) calls it *mastodontosaurus*, and considers it a saurian from the presence of scutes on the skin and the form of the teeth. The general shape of the head is frog-like, as also are the double occipital condyles, narrow palatal processes of the maxillary, the roof of the mouth, the row of small teeth across the anterior part of the palate and a longitudinal row on the palate concentric with the maxillary teeth, the lower jaw and the vertebræ, and bones of the fore limbs; on the other hand, the facial and nasal parts of the skull are crocodilian, as are the maxillary tusks, the strong transverse pro-

Labyrinthodon (restored).

cesses for ribs, bony dermal plates, &c. In some of the dental characters it resembles fishes. The size of the tracks varies from 4 to 12 in. in length, with five toes on each, one turned in like the human thumb; the hind foot was three or four times as large as the fore foot; there is no positive evidence that the animal had a tail; its progression seems to have been slow and awkward, the legs having been swung outward like the course of a scythe. Near each large step, and  $1\frac{1}{2}$  in. before it, is a smaller one of the fore foot, the distance from pair to pair being about 14 in. The American cheirotherium made a double series of tracks, and evidently belonged to a different genus from that of Europe.

**LAC**, a resinous exudation from the twigs and branches of various kinds of trees in the East Indies, caused by the punctures of the insect *coccus ficus*, which swarms upon trees yielding a milky juice. The exuding juice forms an incrustation around the twigs, and in this the insects make the cells for containing their

eggs. Upon the outside the concrete resinous lumps are marked with numerous pores as if perforated with a needle; within are seen many oblong cells, which often contain dead insects. The substance is of a deep reddish brown, of shining fracture, astringent, and bitterish. It colors the saliva red, and produces a dye of this color but little inferior to the real cochineal. Indeed, before the discovery of the latter it was the material of the fine rich crimson dye of the ancients, and of the durable reds of the dyers of Brussels and Holland. The coloring matter is readily extracted by warm water; the lac itself is for the most part soluble in alcohol, also in an aqueous solution of borax, by which it may be distinguished from most common resins with which it is sometimes adulterated; when burned it diffuses a strong agreeable odor. The crude article broken off with the twigs is known as stick lac, and is sold by those who gather it at from 2 to 4 lbs. for a penny. When the stick lac is broken up and its coloring matter is partially removed by water, it is called from its granular appearance seed lac. This is sometimes melted into masses and called lump lac. The more familiar variety known as shell lac is prepared by melting the seed lac and straining it through fine linen bags, upon a flat, smooth surface of wood, to harden. It dries in thin sheets, which break up into small fragments. Their color is from orange to dark reddish brown; they are more or less transparent, hard, brittle, and shining. The substance is soluble in alcohol, but not in water, and possesses neither taste nor smell. It softens readily by heat, so that it has run together in masses when stowed in the hold of a ship. It contains, as found by Hatchett, 90.9 per cent. of resin and 0.5 of coloring matter; the remainder is wax, gluten, and foreign matter. Stick lac contains about 10 per cent. of coloring matter and 68 per cent. of resin. The coloring matter is separated by treatment with warm water and evaporation, and, made into square cakes, is known as lac dye, lac lake, or cake lake. When scraped they yield a bright red powder like carmine. A varnish and pigment combined is prepared from stick lac for the process of jappanning. The natives of India employ the substance in various ways. They color it with yellow orpiment and make it into bracelets, chains, and other ornaments in imitation of gold. They prepare with it a good varnish, which they color with cinnabar or some other pigment. The wheels of their lapidaries are covered with a preparation of lac, which by its adhesive nature retains the polishing powders. The chief uses of shell lac are for manufacturing sealing wax, and as the basis for spirit varnishes and the French polish. The best red sealing wax contains 48 parts in 100 of it, together with 19 parts of Venice turpentine, 1 of balsam of Peru, and 32 of finely powdered cinnabar. It forms 60 per cent. of the best black sealing wax, the other ingredients being 10 parts of turpentine and 30 of levigated

bone black. The coloring matter and some insoluble ingredients, which are never wholly removed from shell lac, injure it for a varnish for light-colored works; but recent methods of bleaching, one of which by chlorine was introduced by Dr. Hare, have in a great measure removed this difficulty. (See VARNISH.) The adhesive quality of lac adapts it for cements for broken porcelain, and united with caoutchouc it makes the famous marine glue. A weak solution of it in alcohol is recommended in surgery to be spread on bandages for dressing wounds and ulcers. Formerly it was used in medicine, but it has no specific action.—The best stick lac is brought from Siam, and next to this ranks that from Assam. In the best articles the sticks are frequently incrustated entirely around with the lac to the thickness of a quarter of an inch; and the substance also forms large oblong bunches of much greater thickness. The Bengal stick lac is commonly in very scanty and irregular incrustations. The capacity of production is said to be many times greater than the demand, though the annual exportations amount to several million pounds of lac dye and shell lac.

**LA CAILLE, Nicolas Louis de**, a French astronomer, born at Rumigny, near Rheims, March 15, 1713, died in Paris, March 21, 1762. He was a pupil of Cassini in the observatory of Paris, assisted Maraldi in the survey of the coast between Nantes and Bayonne, and afterward (1739-'40) took part in the measurement of the arc of the meridian, correcting the results of Picard, and proving the flattening of the earth toward the poles. Being appointed professor of mathematics in the Mazarin college, he published (1741-'50) lectures on mathematics, mechanics, astronomy, and optics, which have passed through many editions. He next devoted himself to astronomical observations, both at his observatory and at the Cape of Good Hope. His catalogue of stars made at the latter station excited especial surprise from the quickness and accuracy of its formation. By simultaneous observations made by himself at the Cape and by Lalande at Berlin, he established the distance of the moon and of the planets Mars and Venus. While there he received orders to survey the island of Bourbon and the isle of France (Mauritius). On his return he investigated anew the problem of finding the longitude at sea, and proposed the modern plan of a nautical almanac. In 1757 he published his *Astronomie Fundamentale*; in 1758, *Tables solaires*; and soon after, Bouguer's treatise *De la gradation de la lumière*, and a new edition of the *Nouveau traité de navigation* by the same author. After his death his friend Maraldi published his treatise on the "Southern Starry Heavens," and his "Voyage to the Cape." La Caille was the author of a large number of other treatises, chiefly on astronomical subjects.

**LACANDONES**, an Indian tribe of Central America, whose territory, formerly embracing

a large proportion of N. W. Guatemala, Chiapas, and perhaps Tabasco, along the banks of the river of their own name and of the Usumasinta, seems at present to be confined to the fastnesses of the Chiche mountains. Little is known, however, of the precise limits of their country, as it is comprised in an extensive region hitherto unexplored, extending from lat. 16° to 17° N., and from lon. 90° to 93° W., according to M. Morelet, who visited the region, and describes it in *Voyage dans l'Amérique Centrale* (Paris, 1869). The Lacandones, now intermingled with the once indomitable Choles and Manches, were formerly aggressive and cruel, and not only successfully resisted the Spanish arms, but by their frequent incursions materially retarded the prosperity of the surrounding European colonies. They are now shy and timid in their limited intercourse with the Spanish population, and even with the civilized aboriginal tribes, to whom they occasionally bring tobacco and sarsaparilla in exchange for manufactured goods and rude instruments of agriculture or warfare. They speak a dialect of the language of the Mayas of Yucatan, in all likelihood the parent stock from which their separation was coeval with and determined by the same causes as that of the Itzaes. (See ITZAES.) Although now subject to the laws of the republic of Guatemala, they preserve the habits and religion of their forefathers, and their territory remains in its primitive condition. There is no reason for believing that they possess large cities and towns, with great temples glistening like silver in the sun, such as the cura of Quiché affirmed to Mr. Stephens that he had seen with his own eyes from the tops of the mountains of Quezaltenango.

**LACCADIVE ISLES** (Sanskrit, *lakke*, hundred thousand, and *dive*, island), a group of small islands in the Indian ocean, consisting of 20 clusters, 100 m. off the Malabar coast, between lat. 10° and 12° 40' N., and lon. 72° and 74° E.; area, 744 sq. m.; pop. 6,800. They are dependencies of British India. The principal are Underoot, Cabarita Akhalu, Kalpeni, Kaltair, Cheltac, Kerdmut, Ameni, Corrittee, and Minicoy. They are all of coral formation. The largest is but 7 m. long, and many of them are barren uninhabited rocks. From the dangerous reefs around them they are seldom visited by navigators, and during the S. W. monsoon all intercourse with the mainland is cut off. The harbor most frequently called at for supplies is Kan-Rattea, lat. 10° 34' N., lon. 72° 56' E. The islands are not fertile, excepting in cocoa-palms, the fruit of which forms the principal food of the inhabitants, and its fibre or coir one of the chief articles of commerce. The other products are rice, in small quantities, sweet potatoes, plantains, and betel nuts. Cows are the only quadrupeds on the islands, and they are few and of small size. The sea abounds in fish and turtles. The natives are an inoffensive race, of Arabian origin, who profess a kind of Mohammedanism, and are

called Moplays. Their dwellings are of stone, thatched. The Laccadives were discovered by Vasco da Gama in 1499.

**LACE**, a fabric of threads of cotton, linen, flax, silk, gold, or silver, interwoven to form a delicate plain or ornamental network. According to some authorities, lace was in use among the Egyptians and the Greeks and Romans. Mrs. Palliser and others suppose the articles referred to as lace in the Old Testament, and other early works, to have been elaborate needlework or embroidery, and that lace was not made until a later period. The invention of lace is claimed both by Italy and Flanders. While it is difficult to determine in which country the manufacture had its origin, it appears that lace was made in both as early as the 15th century. Italian lace is supposed to be referred to in an account dated 1469, and preserved in the municipal archives of Ferrara, while bone and bobbin lace are unmistakably mentioned in a document dated 1493. At a very early period the laces of Venice, Milan, and Genoa were the best known in the commercial world. The "Venice point" lace, wonderful for delicate texture and elaborate design, became specially famous. In England it was highly prized and in general use in the reign of Elizabeth, and it found its way into France about the same period. Toward the latter part of the 18th century the manufacture began to decline, and it has since become extinct. Flemish pictures of the 15th century represent persons adorned with lace, and a Belgian writer asserts that lace cornettes or caps were worn in that country as early as the 14th century. The invention of pillow lace has been claimed for Barbara Uttmann, who in 1561, having obtained aid from Flanders, began to make laces of various patterns at Annaberg, Saxony; but it is asserted by other authorities that she only introduced the manufacture into Germany at that date, as contemporaneous paintings bear evidence to the existence of the art in Flanders more than half a century before. The lace manufacture of the Netherlands increased with remarkable rapidity, and in the 16th century was a source of great wealth to the country. The article produced was of great beauty; the old Flemish laces, the Brussels point and the Mechlin, rivalled the best of the Italian. Every country of northern Europe, France (excepting Alençon), Germany, and England learned the art of lace making from Flanders. Prior to 1665 this industry seems to have been of little importance in France. The lace made was of coarse and inferior quality, and was in little demand compared with the artistic productions of Italy and Flanders, for which enormous sums were annually spent. Nor did the prohibitions against these foreign luxuries develop the native manufacture. In 1666 the manufacture of lace was established at Alençon by Colbert, who had secured from Venice 30 women skilled in the art. Through the aid of

Louis XIV. a great demand was created for this lace, which became known as the point de France and afterward as the point d'Alençon. But its high price limited its use to the rich, who now bought this instead of the Venetian laces. After the success of this enterprise, lace fabrics were established in various parts of France, and the number of lace-workers increased with great rapidity. At the beginning of the 18th century the annual production of lace in France was estimated at 8,000,000 francs. The celebrity of Spanish point lace in early times was scarcely less than that of the Flemish or Italian; but the manufacture has declined. Little is known concerning the origin of the manufacture of lace in Great Britain; but as the importation of this article was prohibited in 1483, it is presumed that the manufacture existed at that time. In 1640 lace making was a flourishing industry in Buckinghamshire, and in the 17th and 18th centuries it extended over a larger area than at present.—Lace consists of two parts, the ground and the flower pattern, or "gimp." In some cases, however, the design is not worked upon a ground, but the different parts are connected with threads. The flower or other ornamental pattern may be made together with the ground, as in Valenciennes or Mechlin, or separately, and then worked in or sewn on (*appliqué*). Lace made by hand is divided into point and pillow. The former, termed needle point, *point à l'aiguille*, &c., is made with the needle on a parchment pattern. Point is also applied to lace produced by a particular stitch. Pillow lace is so termed from the pillow or cushion which for more than three centuries has been used in making lace. On this pillow is fixed a stiff piece of parchment, upon which the pattern is marked by means of small holes pricked in it, through which pins are stuck into the cushion. The threads for the lace are wound upon bobbins—formerly bones, whence the term bone lace. By the twisting and crossing of these threads around the pins, the ground of the lace is made; while the pattern or figure is formed by interweaving a thread thicker than that forming the groundwork, according to the design indicated on the parchment. The designs are prepared by persons who devote themselves to this branch, while their execution is intrusted generally to women. Sometimes as many as 12 of these are employed upon the same design or figure, each having a different portion to produce. *Guipure* is a term so extensively applied to lace that it is difficult to limit its meaning. It is, however, a lace without ground, the designs being joined by "brides," or large coarse stitches. The names of the different varieties of lace have been derived from the places where the manufacture originated or has been carried on with the greatest success. The most noted products are now those of Belgium, France, and England. In Belgium 150,000 women are said to be employed in lace making, the ma-

majority of whom work at home. Throughout the country there are nearly 900 lace schools, many of which are in the convents. One of the most important centres of this industry is Brussels. The thread used, which is made at Hal and Rebecq-Rognon, of flax grown in Brabant, is of extraordinary fineness. The finest quality is spun in dark underground rooms, to avoid the dry air, which causes the thread to break, and to secure the best light, which is done by admitting a single beam and directing it upon the work. It is the fineness of the thread, as well as the delicacy of the workmanship, which has given to the best Brussels lace such celebrity and rendered it so costly. It is often sold at \$1,200 a pound, and has been mentioned as high as \$2,500. In the old Brussels lace the design was worked in with the ground. The *appliqué* lace is now extensively produced, the designs being made on the pillow and afterward attached to the ground with the needle. Mechlin lace, which has been made at Mechlin, Antwerp, Lierre, and Turnhout, formerly had a wide celebrity; but the manufacture has long been on the decline, though it appears to have partially revived. This has been called the prettiest of laces. It is fine and transparent, and is best adapted to summer use, being most effective when worn over color. It is made in one piece on the pillow, with various fancy stitches introduced. Its distinguishing feature is the flat thread which forms the flower, and gives to this lace the character of embroidery; it is hence sometimes called *broderie de Malines*. The most important branch of the pillow-lace trade in Belgium is the manufacture of Valenciennes, which, having become extinct in its native city, has attained great prosperity in Flanders. This lace is now chiefly made at Ypres, Bruges, Courtrai, Menin, Ghent, and Alost. The productions of Ypres are of the finest quality and most elaborate workmanship. Valenciennes lace is made upon the pillow, the same kind of thread being used for the pattern and the ground. It is remarkable for the beauty of its ground, richness of design, and evenness of tissue. It is said that more Valenciennes lace is used than any other kind; but the productions of this century are not equal in quality to those of the last. Grammont, Enghien, and Binche are also important centres of the lace industry. The last few years have witnessed a marked development of the manufacture throughout Belgium, and now white and black point and pillow lace is made in every province of the kingdom.—It is estimated that there are 500,000 lace makers in Europe, of whom nearly one half are employed in France. Almost all of the latter work at home. Of the French laces, the most noted is the point d'Alençon, which has had a wide celebrity for more than two centuries, and has been styled the queen of lace. It is made entirely by hand with a fine needle upon a parchment pattern, in small pieces which are

afterward united by invisible seams. The firmness and solidity of the texture are remarkable. Horsehair is often introduced along the edge to give firmness. Although the workmanship of this lace has always been of great beauty, the designs in the older specimens were seldom copied from nature. This circumstance gave a marked advantage to the laces of Brussels, which represented flowers and other natural designs with a high degree of accuracy. The defect, however, has disappeared in the point d'Alençon of recent manufacture; at the Paris exposition of 1867 were specimens containing admirable copies of natural flowers intermixed with grasses and ferns. Owing to its elaborate construction, this lace is seldom seen in large pieces. A dress made of point d'Alençon, the production of Bayeux, consisting of two flounces and trimmings, was exhibited at the exposition of 1867, the price of which was 85,000 francs. It required 40 women seven years to complete it. Lace made at Chantilly formerly held a high rank, but the manufacture has greatly declined; but Chantilly lace is produced at Bayeux and other places. Bayeux and Caen are important centres of the lace industry, and are specially noted for black laces. The productions of Lille and Arras are well known, though that of the former place is greatly diminished. The Lille lace is noted for the beauty of its ground, "the finest, lightest, most transparent, and best made of all grounds." The work is simple, consisting of the ground and the pattern marked by a thick thread. The lace of Baillieu is strong and cheap, and is extensively used for trimming; much of it is sent to America and India. The lace manufacture of Auvergne, of which Le Puy is the centre, is considered the most ancient and extensive in France; the estimated number of women employed is about 130,000. Nearly every kind of lace is produced here.—In England the manufacture of lace is carried on chiefly in the counties of Buckingham, Devon, and Bedford. The work is mostly done by women and girls at home. The best known of the English hand-made laces is the Honiton, so called from the town of this name in Devonshire, where it was first made. The high rank held by Honiton lace in recent years is attributed to the fact that Queen Victoria, commiserating the condition of the lace-workers of Devonshire, and wishing to bring their manufactures into notice, ordered her wedding dress, which cost £1,000, to be made of this material. Her example was followed by two of her daughters and the princess of Wales, and Honiton lace has continued to be fashionable and expensive. In making it, the designs, which often consist of simple sprigs, are formed separately and then attached to the ground. The Honiton guipure has an original character almost unique, and is said to surpass in richness and perfection any lace of the same kind made in Belgium. British point is an imitation lace made near London. Lace

is made to some extent in Ireland, of which the Limerick is the best known, and in Scotland; also in most of the countries on the continent.—*Machine-made Lace.* Nearly every kind of lace is now made by machinery, and such excellence is attained that it is often difficult even for a practised eye to distinguish between the two kinds. According to Mrs. Palliser, however, "the most finished productions of the frame never possess the touch, the finish, or the beauty of the laces made by hand." While the invention of this machinery has brought lace within the means of a large number who were formerly unable to buy it, the demand for the finer products of the pillow and the needle has not been diminished. The manufacture of lace by machinery is carried on chiefly in England and France, the great centre of this industry in the former country being Nottingham, and in the latter Calais. The first attempts to apply machinery to the work were made in 1758 by a stocking weaver of Nottingham, and his machine, which was called a pin machine, making single press point net in imitation of Brussels ground, is said to be still in use in France for making the variety known as *tulle*. The stocking weavers of Nottingham invented other machines, the first for bobbinet in 1799; and though they were all inferior, they made lace more cheaply than by the old methods, and caused Nottingham to become the centre of the trade. But the first really successful machine for bobbinet (so named from the threads crossing the warp being supplied from bobbins) was that of Heathcoat, invented in 1809, and suggested by the machinery employed in making fishing nets. The principle of the invention was in the use of fixed parallel warp threads, round which the bobbin threads were worked as the weft of the fabric, one set going obliquely across from right to left and the second set obliquely across from left to right. Heathcoat was compelled by the opposition his machine excited to remove from Nottingham to Devonshire, and it was not until the expiration of his patent in 1823 that the machine was introduced in the former place. In the machine the warp threads, to the number of 700 to 1,200 in a yard of width, are stretched from a roller, which extends the whole length of the thread beam, and the weft threads are wound each upon a bobbin formed of two thin brass disks riveted together, leaving a narrow space between them for the thread. Each bobbin holds about 100 yards of thread, and there are as many as 1,200 of them to a machine. The arrangement and movement of these in the machine can be understood only by careful inspection and study of the machine itself. The pieces of bobbinet measure from 20 to 30 yards each; the width is variable. The narrowest strips, even the narrow quillings used for cap borders, are made on the same machine, many breadths together, which are temporarily united by threads that are finally

drawn out. There are special machines called warp machines, of great variety, for making the sorts of lace known as warp lace; and there are others called point net for making this quality. A Jacquard apparatus is attached to some of the machines for working in the thick thread of gimp for the ornamental figures. Where the thread passes from one figure to another, it is clipped off by children, who use the scissors for this purpose with great dexterity. The patterns at many of the factories are worked in by hand. The government school of design established at Nottingham has served to educate many skilful designers, who prepare the patterns upon wood or stone as for engraving or printing, those parts intended to leave a mark being in relief. The block, being moistened with some colored pigment, is repeatedly impressed upon the net, until the pattern is transferred to the whole surface designed for it; and the figure is then worked with the needle, the web being extended horizontally in a frame. Before being embroidered the net is carefully examined, and the defective parts are skilfully repaired by a class of workwomen called lace menders. It is also singed by drawing it rapidly over the flame of gas lights. Bleaching and dyeing are final processes, preceding those belonging to calendering. "The labor of washing lace is almost an art; and only the most skilful are engaged in it. After washing, lace is spread out to dry on a cushioned table, and pins of a peculiar sort are run through each hole to prevent it from shrinking. When very fine, or the pattern intricate, an entire day will be spent upon one yard of lace." By means of the application of machinery to lace making, the price of the fabric has been wonderfully reduced; so that a rack of lace, equal to 240 meshes in the length, which in the early part of the present century cost to manufacture 3s. 6d., now costs not more than one penny; and a 24-rack piece, 5 quarters broad, formerly worth £17, is now sold for 7s.—Full information on this subject is given in the "History of Lace," by Mrs. Bury Palliser (London, 1865; 2d ed., 1869). See also the "History of Machine-wrought Hosiery and Lace Manufacture," by W. Felkin (London, 1867).

**LACE-BARK TREE** (*Agave lintearia*), a tree 25 to 30 ft. high, which is found in the island of Jamaica in the most inaccessible rocky places. It belongs to the family *thymelacææ*, which includes the daphnes, our leatherwood or wicopy (*Dirca*), and other plants noted for the great tenacity and sometimes poisonous quality of their inner bark. In *Agave* (from the insular name *Agave*) the inner bark consists of numerous layers, composed of fibres which interlace in all directions, so that when it is stretched transversely a layer of it has much the appearance of lace. Persons who visit Jamaica nearly always bring away a piece of this vegetable lace as one of the curious products of the island; and it is said to be still in

use there for articles of apparel. In the days of slavery in the island the lace-bark furnished thongs for the taskmaster's whips.

**LACÉPÈDE**. See LACONIA, and SPARTA.

**LACÉPÈDE, Bernard Germain Étienne de La Ville**, count de, a French naturalist, born in Agen, Dec. 26, 1756, died at his country seat near St. Denis, Oct. 6, 1825. He early evinced a taste for natural philosophy and musical composition, and going to Paris when 20 years old, was welcomed by Buffon and by the composer Gluck. He gave to music the time not devoted to natural philosophy, composed several operas, and in 1785 published his *Poétique de la musique* (2 vols. 8vo), in which Gluck's principles are expounded. He had previously written an *Essai sur l'électricité naturelle et artificielle* (2 vols. 8vo, 1781), and *Physique générale et particulière* (2 vols. 12mo, 1782-'4), which, although not well received by men of science, had such merits of style that Buffon engaged him as an assistant in continuing his "Natural History," and appointed him keeper and assistant demonstrator at the museum. His *Histoire des quadrupèdes ovipares et des serpents* (2 vols. 4to, 1788-'9) and *Histoire naturelle des reptiles* (4to, 1789) have been frequently reprinted as sequels to Buffon's work. He favored the revolution, received several offices of trust, and was elected in 1791 to the legislative assembly, over which he presided toward the end of the same year. On the massacres of September, he so energetically expostulated with Danton that his friends removed him from Paris, and persuaded him to resign his office at the museum. He did not return till after the 9th Thermidor. Being regarded as the legitimate heir of Buffon, he took his seat among the original members of the institute on its foundation, and was appointed to the newly created professorship of herpetology in the *jardin des plantes*. His *Histoire naturelle des poisons* (6 vols. 4to and 11 vols. 12mo, 1798-1803) and *Histoire des cétacés* (4to and 2 vols. 12mo, 1804) display great descriptive talent. On the organization of the consular government, he was made a member of the senate, in 1801 president of that body, in 1803 grand chancellor of the legion of honor, and soon afterward minister of state. As president of the senate he presented in 1809 the report upon the divorce of Napoleon and Josephine. He submitted to the Bourbons on their first return, joined Napoleon during the hundred days, and, though coldly treated on the second restoration, reentered the chamber of peers in 1819. He died of smallpox. Besides the works mentioned, he was the author of several papers printed in the *Mémoires* of the institute, and, jointly with George Cuvier and Geoffroy Saint-Hilaire, of *La ménagerie du musée national d'histoire naturelle* (1801), a descriptive history of the animals in the *jardin des plantes*. He devoted the last months of his life to correcting the notes of the *Histoire générale, physique et*

*civile de l'Europe, depuis les dernières années du 5<sup>e</sup> siècle jusque vers le milieu du 18<sup>e</sup>,* which appeared after his death (18 vols. 8vo, 1826), and attracted very little attention. To this must be added two other posthumous works: *Histoire naturelle de l'homme* (8vo, 1827), and *Les âges de la nature et l'histoire de l'espèce humaine* (2 vols. 8vo, 1830). Under the title of *Œuvres de M. le comte de Lacépède*, his discourses and natural histories of cetaceous and oviparous animals, snakes, and fishes were collected in 11 vols. 8vo, 1826, and reprinted in 1831-'3, 1836, 1840, and in 3 vols. 8vo, 1862.

**LA CERDA**, the name of an ancient Spanish family, which traced its origin to Fernando, the eldest son of Alfonso X. of Castile, called La Cerda, or the horse's mane, from a large tuft of hair which grew upon his shoulders. In 1269, at the age of 15, this prince married Blanche, daughter of St. Louis of France. Fernando died in 1275, leaving two sons, Alfonso and Fernando, heirs to the crown. But Sancho, second son of Alfonso X., claimed the succession, and caused himself to be proclaimed in his father's lifetime. Yolande, the wife of Alfonso, fled from Castile with her grandchildren, to find a protector for them in her brother Don Pedro, king of Aragon, or in their uncle Philip the Bold of France. These kings resolved that the young princes should remain prisoners in Aragon, and Yolande returned to Castile alone. Blanche, the mother of the princes, wandered through France and Aragon, vainly exclaiming against the injustice of this decision. Alfonso X. died in 1284, and in his will made Alfonso and Fernando de la Cerda his heirs, and even in their default excluded from the throne that son by whom the latter years of his life had been embittered. So sweeping a disinheritation was of little force, and caused slight hesitation between the unfortunate children and Sancho, already in possession of the throne, whose victories over the Moors had just given him the surnames of the Strong and the Valiant. At length, when it became the interest of the king of Aragon to embarrass the king of Castile, he set the princes of La Cerda at liberty. They were proclaimed at Badajoz and Talavera; but being unable to maintain themselves in Castile, they passed into France in the reign of Philip the Fair. They received from him but slight assistance, and their military operations were unfortunate. Sancho had died and had been succeeded by his own son. The kings of Portugal and Aragon, being invited to act as mediators between the ruling and the proscribed branches of the family, gave a decisive sentence in favor of the former, stipulating only that three cities should be ceded to Alfonso to aid him in maintaining the dignity of his birth. Alfonso, deserted by all his defenders, accepted the terms, and received the surname of the Disinherited. He died in 1325, leaving two sons. One of these, Carlos de la Cerda, known also as Charles of Spain, was appointed by King John in

1350 constable of France. But the French court was soon disturbed by a rivalry between Charles of Spain and Charles the Bad, king of Navarre; and in 1354, while on a visit to his young wife in the castle of L'Aigle in Normandy, the former was poniarded by assassins in the pay of the king of Navarre. In 1425 the house of La Cerda became extinct, but it is still represented in the female line by the dukes of Medina-Cœli.

**LA CHAISE** (or *Lachaise*) **D'AIX, François de**, a French Jesuit, confessor of Louis XIV., born at the château of Aix, in Forez, Aug. 25, 1624, died Jan. 20, 1709. He taught philosophy and theology with brilliant success at Lyons, was afterward rector at Grenoble and provincial of his order at Lyons, and in 1675 succeeded Ferrer as confessor of the king. He maintained his position amid the difficulties between Mme. de Montespan and the queen, Mme. de Montespan and Mme. de Maintenon, the Jesuits and the Jansenists, Bossuet and Fénelon, and the courts of Rome and of France. He promoted the revocation of the edict of Nantes (1685), but exerted a conciliatory influence with respect to Fénelon, Quesnel, and the Jansenists. Louis XIV. built for him a country seat on an estate called Mont Louis, which belonged to the Jesuits, the gardens of which are now transformed into the cemetery named Père Lachaise. (See CEMETERY.)

**LACHES** (law Fr. *lachesse*, idleness). The law shows no favor to either tardy or negligent suitors. *Vigilantibus non dormientibus jura subveniunt* (the laws assist those who are vigilant, not those who sleep upon their rights). In this spirit are framed statutes of limitation. (See LIMITATION, STATUTES OF.) So, too, in respect to the production of evidence: testimony discovered after a trial may be heard by the court, if material to the case; but if, by the exercise of a proper diligence, the evidence might have been offered at the trial, its non-production is attributed to the party's neglect or laches, and from the consequence of that the court will not willingly relieve him. The word laches remains familiar in the law of negotiable paper. The same principles of diligence and laches are found in equity practice. The negligence of a party in bringing suit or doing some other act required of him in order to become entitled to redress is laches, which the court of equity will discountenance. In the language of Baron Alderson: "Nothing will call the court's jurisdiction into exercise but conscience, good faith, and reasonable diligence. When these fail, the court will remain passive." For example, one who claims specific performance of an agreement must show that he has been in no default in the premises, but that he has taken all proper measures to secure performance; for if he has been guilty of laches his bill for relief will be dismissed. But, *nulum tempus occurrit regi*, lapse of time does not bar the rights of the crown; in other words, no laches can be imputed to the sover-

eign, whether crown or state. Not unfrequently, however, statutes of limitation are made applicable to demands on behalf of the sovereign, and also to criminal charges.

**LACHMANN, Karl**, a German philologist and critic, born in Brunswick, March 4, 1793, died in Berlin, March 13, 1851. He was educated at Leipzig and Göttingen, and in 1811 founded in the latter city, in conjunction with Dissen, Schulze, and Bunsen, a critical and philological society. He was successively preceptor at the gymnasium and professor in the university of Königsberg, and from 1827 till his death was a professor in that of Berlin. Among his numerous publications are critical editions of Propertius, Catullus, Tibullus, Lucretius, Gaius, the *Nibelungenlied*, Walther von der Vogelweide, and Wolfram von Eschenbach, and *Betrachtungen über die Ilias* (Berlin, 1847).

**LACHNER. I. Franz**, a German composer, born at Rain, Bavaria, April 2, 1804. He studied under the abbé Stadler, and in 1834 became chapelmaster at Mannheim. In 1835 he received the first prize for symphonic composition at Vienna with his *Sinfonia passionata*, and became royal chapelmaster at Munich. His compositions include symphonies, overtures, organ pieces, masses, oratorios, operas, and chamber, pianoforte, and vocal music. **II. Ignaz**, brother of the preceding, born at Rain, Sept. 11, 1807. He was first violinist at the opera and organist of a church in Vienna, and in 1831 became chapelmaster to the king of Würtemberg. He has written for both voice and instruments, and his works comprise operas, symphonies, ballets, and overtures; but he is best known from his songs. **III. Vincenz**, brother of the preceding, born at Rain in 1811. He succeeded Ignaz as organist and violinist in Vienna, and has written many admirable compositions for orchestra and stringed instruments, and also concerted vocal music.

**LACHRYMÆ CHRISTI**. See ITALY, WINES OF. **LACKAWANNA**, the name of a river and coal basin in Luzerne co., Pa. The stream rises in the N. E. corner of the state, enters the N. E. extremity of the northern anthracite coal field, along which it continues for 30 m. past Carbondale, Archbald, Providence, and Scranton, to the N. branch of the Susquehanna, which it enters at Pittston. The continuation of the Lackawanna valley S. W. of Pittston is the Wyoming valley, and they are shut in by the Shawnee mountain on the N. W. and the Wyoming or Moosic mountain on the S. W., the only gaps being where the Susquehanna enters at Pittston and passes out at Nanticoke. These mountains are steep rocky ridges, with a general elevation of from 1,500 to 2,000 ft. above the valley, which at Wilkesbarre is 525 ft. above the sea. The valley has an irregular trough-like form and an undulating surface, corresponding to that of the rock strata and coal beds beneath; and it is studded with thriving cities and towns, collieries, rolling mills, and blast furnaces. The entire area is 198 sq.

m., of which the Lackawanna valley has 100 sq. m. The coal field, the largest and finest of the anthracite basins, fills both valleys, and is of a narrow ellipsoidal form, slightly crescent-shaped, stretching in a N. E. and S. W. direction about 50 m., and not attaining in its widest central portion a greater width than 5 m. (See map in article ANTHRACITE.) The coal is mined from beds 5 to 14 ft. thick, at depths of 100 to 400 ft. from the surface; and in the Wyoming region the maximum depth of the basin is estimated at 1,800 ft., though none of the mines as yet exceed 550 ft. At Scranton there are four beds, 6, 7, 12, and 6½ ft. thick, at the depth of 125, 160, 300, and 400 ft. This coal field, being the nearest to New York, supplies a large portion of the anthracite consumed in that state and further east. Nine tenths of the coal is carried over the mountains. Around Carbondale coal is mined by the Delaware and Hudson canal company, and carried by their railroads over the Moosic mountain to Honesdale, 28 m., and thence by canal to Rondout on the Hudson river, 108 m. Since 1828 they have transported 27,227,471 tons of Lackawanna coal, of which 2,472,449 tons were mined in 1873. The Delaware, Lackawanna, and Western railroad company, whose chief operations are at Scranton, have 618 m. of railroad. Since 1851, when they forwarded their first coal to market, they have sold 26,404,867 tons, including 3,136,306 tons mined in 1873. The operations of the Pennsylvania coal company near Pittston, which has a railroad worked entirely by gravity and stationary engines, cover 16,424,322 tons mined since 1850, of which 1,239,214 tons were produced in 1873. There are other smaller proprietors, and a large iron manufacturing company at Scranton owning five blast furnaces and two rolling mills, which consume 300,000 tons of coal per annum. The avenues to market for coal from the Lackawanna valley are: the Jefferson branch of the Erie railway, from Carbondale N.; the Delaware and Hudson canal company's railroad, E.; the Delaware, Lackawanna, and Western railroad, 145 m., to New York; the Delaware, Lackawanna, and Western railroad, N. into New York state; the Pennsylvania coal company's railroad, E. to Hawley, 47 m., and thence by the Erie railway to New York, 126 m. From Wyoming valley: the Lehigh Valley railroad, 187 m., from Pittston to New York; the Pennsylvania and New York canal and railroad, N. into New York state; the Central New Jersey railroad, 194 m., from Scranton to New York; the Delaware, Lackawanna, and Western railroad and the Pennsylvania canal, S. to Baltimore. Several of these roads have branches into different parts of both valleys. The total amount of coal sent to market from both valleys since 1829 is 97,780,855 tons, including 10,047,241 tons in 1873.

**LA CLEDE**, a S. county of Missouri, drained by Gasconade river; area, 710 sq. m.; pop. in 1870, 9,380, of whom 162 were colored. It

has a rolling surface, in some places well timbered, in others occupied by prairies. The Atlantic and Pacific railroad crosses the county. The chief productions in 1870 were 66,993 bushels of wheat, 317,154 of Indian corn, 57,855 of oats, 27,872 of potatoes, 31,750 lbs. of tobacco, 16,773 of wool, 86,940 of butter, and 1,851 tons of hay. There were 2,854 horses, 2,065 milch cows, 4,005 other cattle, 7,980 sheep, and 12,362 swine; 5 flour mills, and 2 saw mills. Capital, Lebanon.

**LACLOS, Pierre Ambroise François Choderlos de**, a French writer and soldier, born in Amiens in 1741, died in Taranto in 1803. He entered the army at the age of 18, and reached the rank of captain in the corps of engineers in 1778. In 1782 he published a licentious novel, *Les liaisons dangereuses*, which nearly vied in point of popularity with Louvet's *Faublas*. After 30 years of military service he became secretary of the duke of Orleans, and thenceforth mingled in all the intrigues which aimed at the overthrow of Louis XVI. with the view of placing his own master on the throne. He became an ardent revolutionist, a prominent member of the Jacobin club, conducted their journal, and was the first to call for the deposition of the king after his flight to the frontier. With Brissot, he wrote the petition for the same object which was to be signed at the Champ de Mars, July 17, 1791, and brought about the massacre with which Lafayette and Bailly were so bitterly reproached. For a time he served in Marshal Luckner's army in the north, and was made brigadier general, Sept. 22, 1792. The next year he was incarcerated, but was liberated on the 9th Thermidor. After commanding the artillery in the army of the Rhine, he was sent in the capacity of inspector general to the army in southern Italy, where he died. He was the author also of *Poésies fugitives* (1783), of a continuation of Vilate's *Causées secrètes de la révolution du 9 thermidor*, and of several works on military tactics and fortifications.

**LACOMBE, Francis**, a French author, born in Toulouse in 1817, died at Arcachon, Sept. 5, 1867. He was in 1848 politico-economical editor of the *Assemblée nationale*, and fought a duel with Charles Blanc, who had challenged him for writing against his brother Louis. A five-franc piece in his pocket saved his life. His principal works are: *De l'organisation générale du travail* (1848, and many new editions); *Histoire de la bourgeoisie de Paris* (4 vols., 1851-'2); *Histoire de la monarchie en Europe* (4 vols., 1853-'5); and *Histoire de la papauté* (2 vols., 1867, unfinished).

**LACONDAMINE.** See **CONDAMINE**.

**LACONIA, Laconia**, or **Lacedæmon**, the southeasterly division of the ancient Peloponnesus, bordering on Messenia, Arcadia, and Argolis. The country comprised within its boundaries is a long valley shut in on three sides by mountain ranges, and open only on the south to the sea. On the north are the Arcadian

mountains, from which stretch two parallel ranges, Taygetus on the west and Parnon on the east, the former terminating on the S. coast in the promontory of Tanarum (now Cape Matapan), the most southerly point of the continent of Europe, the latter in the promontory of Malea. The principal summit of Taygetus, Taletum (now St. Elias), is 7,900 ft. high; the highest point of Parnon is about 6,350 ft. Taygetus is covered with forests of green pine, which, abounding in ancient times with game, was reputed one of the favorite haunts of Diana. In the southern part are rich quarries of marble and iron. The Eurotas, the chief river (now called Iris or Vasilopotamos), flows through the entire valley, is fed by several smaller streams, and empties into the gulf of Laconia. Lacedæmon or Sparta, the ancient capital, stood on its banks. There were no other towns of much importance. Amyclæ, in the plain S. of Sparta, was the ancient residence of the Achæan kings, but had lost its consequence in the time of Pausanias. Helos, on the Laconian gulf, is supposed to have given the name to the Helots. Gythium, also on the gulf, was the naval station of the Spartans, but there are no very good harbors on the coast. Laconia has much arable land, but the soil in general is poor and difficult to plough. According to Pausanias, the Leleges were the earliest inhabitants. In the time of the Trojan war the Achæan kings possessed the country. They were conquered by the Dorians, who became masters of all Laconia by the middle of the 8th century B. C. (See **SPARTA**).—The modern Laconia, a nomarchy of the kingdom of Greece, occupies very nearly the same territory; area, 1,678 sq. m.; pop. in 1870, 105,851. It is divided into four eparchies. Capital, Sparta, built since the revolution on one of the five hills of the ancient city.

**LACORDAIRE. I. Jean Baptiste Henri**, a French Roman Catholic divine, born at Recey-sur-Ource, Côte d'Or, May 12, 1802, died in Sorèze, Nov. 22, 1861. He was the son of a physician who had served in America under Rochambeau, was educated at Dijon, followed the prevailing impulse that was animating young men against the tendencies of the restoration, distinguished himself alike by the earnestness of his liberal opinions and by a peculiar obstinacy of character, and graduated in 1819 with the highest university honors. While studying the law at Dijon, he continued to attract notice by his intellectual power and anti-Catholic enthusiasm, especially as an orator in the literary societies. In 1821 he went to Paris to practise as a *stagiaire*, and for 18 months was employed as assistant to an advocate at the court of cassation. He also pleaded several cases with great success. But suddenly he abandoned the bar to enter the seminary of Saint Sulpice as a student of theology. He explains this change by saying that the soul of a young man "demands only a great cause to serve with great devotion." His social theories,

doubtless, prepared his return to the Catholic faith, his aim being to revive society by the instrumentality of religion and the church. While in the seminary his ardent piety was alike dissatisfied with the Cartesian philosophy and the Gallican liberties, the former granting too much to human reason, the latter verging to schism, neither being absolute enough. Yet he preserved in his new calling all the love of liberty which had animated his youth, linking it with the vital idea of Christianity, and his peculiar tendencies attracted the notice of his superiors both before and soon after he was ordained to the priesthood in 1827. He was appointed successively chaplain in a convent, in the college of Juilly, and in that of Henry IV. At Juilly he formed the acquaintance of Lamennais, who then advocated extreme ultramontaniam in religion and radicalism in politics; and his doctrines had such an influence on Lacordaire, that he has been called "one of Lamennais's best works." In 1830 Lacordaire and Montalembert associated themselves with Lamennais in founding *L'Avenir*, a journal whose motto was *Dieu et la liberté*, and which was devoted to the maintenance of the absolute authority both of the pope and the people. The bold theories and violent tone of this journal caused the editors to be brought before the civil courts, where Lacordaire's eloquence obtained a verdict of acquittal. He thereupon demanded that his name should be placed on the list of advocates; but the court decided that this was not consistent with his priestly functions. With Montalembert and De Coux he immediately opened a free school without the authorization of the government. The school was closed by the police, and Montalembert, happening just then to become by his father's death a peer of France, was summoned together with his associates before the chamber of peers, to answer for their infraction of the law. They spoke each in his own defence, and were sentenced to pay a fine. The political and religious reforms advocated by *L'Avenir* were condemned by Gregory XVI. in September, 1832. Lamennais, who had gone to Rome with the other editors for the purpose of averting this blow, replied to it shortly afterward by publishing his *Paroles d'un croyant*. But the others submitted to the papal sentence, and Lacordaire, separating himself for ever from Lamennais, wrote a pamphlet declaring his unqualified obedience to the Roman see. In 1834 he began his first course of lectures (*conférences*) in the chapel attached to the collège Stanislas. Though severely censured by many, their impression on young men particularly was so great that Archbishop De Quélen invited the preacher to deliver the Lenten course in the cathedral of Notre Dame in 1835. His sermons were admired not less for their literary excellence and a sort of romantic tone, than for their religious fervor. "He knows more of literature," said a severe critic, "than of history, more of history

than of philosophy, and more of philosophy or even politics than of religion;" and in his conferences all the social questions which had recently agitated France were discussed with an ability and splendor of style that attracted the most eminent men of letters. After two years of success, he again went to Rome in 1836, for the purpose, as was said, of studying theology, and there wrote his *Lettre sur le saint siège*, a solemn argument and protest against the doctrines of *L'Avenir*. He had already conceived the plan of reviving or founding a religious order in France, and after preaching in 1838 in Notre Dame he returned again to Rome, entered the order of the Dominicans and the convent of the Minerva, passed his novitiate in the convent of Quercia, wrote his *Vie de Saint Dominique* (Paris, 1840; new ed., 1858; translated into Spanish, Polish, and German), and in 1841 resumed his chair at Notre Dame, a friar preacher with shaved head and white robe. He preached afterward in the principal cities of France, reëstablishing the order of Dominicans, and displaying a new style of eloquence, which excited at once surprise and enthusiasm. On the outbreak of the revolution of 1848, being elected to the constituent assembly, he appeared there in his Dominican habit, and took his place on "the mountain," two benches from Lamennais, but soon gave in his resignation when he found that his reconstructive theories would have little chance in the conflicts of partisan politics. On Feb. 10, 1853, he preached a charity sermon in the church of St. Roch in behalf of the city poor schools. His theme was the formation of true manhood by education. He said toward the conclusion: "He who uses base means even for a good purpose, even for the salvation of his country, is still a scoundrel. There is no need of an army to stop my speech; a single armed man is sufficient. But God has given me, for defending my words and the truth that is in them, a something which can withstand all the empires of earth." He was commanded forthwith to quit Paris. He resigned shortly afterward his office of provincial of the Dominicans in France, ceased to preach in public, and devoted himself exclusively to the direction of the college of Sorèze, which belonged to himself. He wrote in 1858 that the new provincial and the general of his order had completely set him aside, and were laboring to ruin his influence among the French Dominicans. After the death of Alexis de Tocqueville, Lacordaire was elected his successor by the French academy; and in his inaugural discourse, Feb. 2, 1860, he made a glowing panegyric of American free institutions. Till the end of his life he united with Montalembert and Bishop Dupanloup in denouncing Louis Veuillot's manner of defending the interests of the Roman Catholic church. Among his works are: *Considérations philosophiques sur le système de M. de Lamennais*

(1834); a *Mémoire pour le rétablissement en France de l'Ordre des frères prêcheurs* (1840); *Conférences de Notre Dame de Paris, 1835-'50* (4 vols., 1844-'51); those on "God" and "Christ" translated into English by Henry Langdon, New York, 1871); *Lettre à un jeune homme sur la vie chrétienne* (1858); *De la liberté de l'Italie et de l'Eglise* (1861); and *Lettres à des jeunes gens* (1862). His complete works have appeared in 6 vols. (Paris, 1858). Count de Falloux has published *Correspondance du père Lacordaire et de Madame Swetchine* (1865).—See Montalembert, *Le père Lacordaire* (8vo, Paris, 1862); Chocarné, "Inner Life of Père Lacordaire" (8vo, London and New York, 1867); Villard, *Correspondance inédite et biographie du père Lacordaire* (Paris, 1870); De Loménie, *Galerie des contemporains illustres*; and Sainte-Beuve, *Lacordaire orateur, in Causeries du Lundi*. **II. Jean Théodore**, a French naturalist, brother of the preceding, born at Recey-sur-Ource, Feb. 1, 1801, died in Liège, Aug. 31, 1870. He studied law in Dijon, but from his love of natural science made four different voyages to South America between 1825 and 1832. He visited the Argentine republic, Chili, the Brazilian provinces of Pernambuco and Rio de Janeiro, and French Guiana, and afterward travelled through the interior of Senegal. Toward the close of 1832 he was attached to the editorial staff of the *Temps* in Paris, and wrote for several scientific periodicals. In 1835 the Belgian government appointed him professor of zoology in the university of Liège; in 1838 he became professor of comparative anatomy, and in 1850 dean of the faculty of sciences. Among his numerous publications are: *Introduction à l'entomologie* (2 vols., Paris, 1834-'7); *Faune entomologique des environs de Paris* (1835); and *Histoire naturelle des insectes: genera des coléoptères* (8 vols., 1854-'68).

**LACQUER**, a transparent or colored varnish for covering articles of brass or wood, either for ornament or to preserve them from becoming tarnished. Shell lac is the basis of the varnish commonly employed, whence the coating is termed lacquer, and the process lacquering. Holtzapffel gives the following recipes for "hard-wood lacquer": 2 lbs. of shell lac to 1 gallon of alcohol, but without turpentine; or 1 lb. of seed lac and 1 lb. of white rosin, dissolved in 1 gallon of alcohol. Various recipes are given for the lacquer for brass; the simplest and best pale lacquer is made by dissolving, without applying heat and by agitating together for five or six hours, half a pound of best pale shell lac and a gallon of alcohol. After standing for some time the clearer portion may be decanted, or the whole filtered through paper, and afterward kept in a close bottle excluded from the light. To give a yellow tint, gamboge, turmeric, or Cape aloes may be added to the shell lac; and for a red, dragon's blood and annotto. The most convenient method of employing the colors is to make

saturated solutions of them in alcohol, and to add suitable quantities of these to the pale lacquer. Solutions of turmeric, gamboge, and dragon's blood will be the most useful. The turmeric gives a greenish yellow tint, and with the addition of a little gamboge gives the green color to the lacquer used for bronzed works.

**LAC QUI PARLE**, a S. W. county of Minnesota, bordering on Dakota; area, 1,450 sq. m.; pop. in 1870, 145. It is bounded N. E. by the Minnesota river, which here receives the Lac Qui Parle river. The surface consists of rolling prairies.

**LACRETELLE. I. Pierre Louis**, a French jurist, born in Metz in 1751, died in Paris, Sept. 5, 1824. He had gained distinction both as an advocate and *littérateur*, when in 1778 he went to Paris, and was for several years one of the editors of the *Grand Répertoire de Jurisprudence*. His *Discours sur le préjugé des peines infamantes* was crowned by the French academy in 1786, and in 1787 he was one of a commission named by the king for the reform of penal legislation. In 1791 he was elected deputy for Paris in the legislative assembly, where he voted with the minority which defended the constitution of that year, supported the constitution in the club of the Feuillants, opposed the accusation of Lafayette in 1792, and afterward retired from Paris till the 9th Thermidor. He was a member of the legislative body in 1801, and succeeded La Harpe in the French academy in 1803. He accepted no office under the empire or the restoration, and wrote against the latter in the *Minerve Française*, founded in 1817 by Benjamin Constant, Étienne, Jouy, and others, of which he was one of the editors. His complete works, which treat various questions in philosophy, literature, and politics, were published in 1824, in 6 vols. **II. Jean Charles Dominique de**, a French historian, brother of the preceding, born in Metz, Sept. 3, 1766, died near Mâcon, March 26, 1855. He went to Paris in 1787, and was attached for a time to the *Journal des Débats*, for which he reported the speeches made in the constituent assembly and wrote many articles. In 1790 he became secretary to the duke de La Rochefoucauld-Liancourt; and he was associated with him in the project of securing the escape of the royal family, which was defeated by the king's indecision. After the execution of Louis XVI., of which he composed the narrative that was generally copied and translated, he occupied himself in lecturing on history and in writing for the *Journal de Paris* and the *Républicain Français* against the Jacobin party. On the 13th Vendémiaire (year IV.) he was proscribed as one of the leaders of the royalist movement against the convention, and retired to Épinay, where he began (1795) his *Histoire de France pendant le dix-huitième siècle* (6 vols. 8vo, 1808). Returning to Paris, he was arrested on the 18th Fructidor, and imprisoned for 23 months (1797-'9). Under the empire he was a member of the bureau of the press, editing at

the same time *Le Publiciste*, became imperial censor in 1810, successor of Esmeñard in the academy in 1811, and professor of history in the faculty of letters in 1812, where for 36 years his course was numerously attended. He was among the first to rally around the Bourbons in 1814, and in 1822 he received letters of nobility from Louis XVIII. When in 1827 Peyronnet proposed a law restricting the press, Lacroix delivered before the academy an eloquent harangue against it, which led that body to address the king in opposition to it. For this speech he lost his office of royal censor, which he had held since 1814. He retired to Mâcon in 1848. His historical works, nine in number, comprise the period from the commencement of the religious wars to the accession of Louis Philippe, but most fully that of the first revolution. Most of them are the first that were written on the period of which they treat, and the judgments are often those of a contemporary partisan.

**III. Henri de**, a French author, son of the preceding, born in Paris in 1816. He has published a number of works, including *Les cloches* (poems, 1841), *Dona Carmen* (1844), *Valence de Simian* (1845), *Nocturnes* (1846), *Contes de la méridienne* (1859), *Les noces de Pierrette* (1859), *Les nuits sans étoiles* (1861), *Le colonel Jean* (1865), and *Sous la hache* (1872). The last, a philosophical romance, is a plea for the abolition of the death penalty. In 1871 he was elected to represent Saône-et-Loire in the national assembly.

**LACROIX. I. Paul**, a French novelist and historical and philological writer, born in Paris, Feb. 27, 1806. Under the pseudonym of *Le bibliophile Jacob*, he wrote a number of historical tales and novels, in which he displayed much curious erudition. In 1834-5 he published *Histoire du 16<sup>e</sup> siècle en France, d'après les originaux manuscrits et imprimés* (4 vols. 8vo). He then produced in rapid succession an extraordinary number of novels, translations, and historical, philological, bibliographical, and polemical works. He has also been the editor of or a contributor to many periodicals. Since 1854 he has edited the *Revue universelle des Arts*, published simultaneously at Paris and at Brussels. He was appointed in 1855 keeper of the arsenal library, and is a member of historical committees connected with the ministry of public instruction. Among his later works are: *Dissertations bibliographiques* (1864); *Un mobilier historique des XVII<sup>e</sup> et XVIII<sup>e</sup> siècles* (1865); *L'Histoire de la vie et du règne de Nicolas 1<sup>er</sup>, empereur de Russie* (4 vols., 1864-'8); *Arts au moyen âge et à l'époque de la Renaissance* (1868; translated and illustrated, London, 1873; supplement, 1870); *Mœurs, usages et costumes au moyen âge et à l'époque de la Renaissance*, with 440 plates (1871); and *La vie militaire et la vie religieuse au moyen âge* (1872).—His wife, **APOLLINE BIFFE**, who was once an actress under the name of Pauline Derfeuille, gained some reputation as a novelist.

Among her works are *Fleur de serre et fleur des champs* (1854), *Falcone* (1856), and *Madame Berthe* (1857). **II. Jules**, a French poet and novelist, brother of the preceding, born in Paris, May 7, 1809. In 1830 he published a translation of Shakespeare's "Macbeth," which was highly praised by literary critics. He subsequently applied himself to novel writing, in which line of composition he is more remarkable for bitterness of sentiment, satirical power, and intricacy of plot, than morality and chasteness of style. His five-act tragedy, *Le testament de César*, was performed with success in 1849, at the Théâtre Français. In his *Valéria* (1851), another five-act play, written in conjunction with Auguste Maquet, Rachel filled two different parts. His literal version of Sophocles's *Œdipus Rex* was performed with marked success, Sept. 18, 1858, and obtained in 1862 from the French academy the grand prize of 10,000 francs. In 1868 his *Le roi Lear*, in five acts, in verse from Shakespeare, was successfully presented at the Odéon.

**LACROIX, Paul Joseph Eugène**, a French architect, born in Paris, March 19, 1814, died there in February, 1873. He was a foster brother of Napoleon III., studied in Paris and in Italy, was employed in restoring the town hall of St. Quentin, and as architect of the Elysée (1852) he designed the enlargement of this palace and also that of the Tuileries. He designed the tomb of Pope Adrian V. at Viterbo, a monument to Ney, and many other works.

**LACROIX, Sylvestre François**, a French mathematician, born in Paris in 1765, died there, May 25, 1843. He belonged to a poor family, but by his own exertions acquired an education, and became such a proficient in mathematics, that when scarcely 17 he was appointed professor in the marine school at Rochefort. In 1786 he went to Paris, and in 1787 became a professor in the military school. While he occupied this chair, the academy of sciences awarded him a prize of 6,000 livres for a treatise on maritime insurance. He held professorships consecutively in the artillery school, the normal school, the polytechnic school, the Sorbonne, and the collège de France. He was among the original members of the institute. In 1796 he began the publication of his elementary *Cours de mathématiques*, comprising arithmetic, algebra (English translation, Cambridge, Mass., 1818), geometry, and trigonometry, which was for years the best text book of its kind. Among his works are *Traité du calcul différentiel et intégral* (2 vols. 4to, 1797), and treatises on mathematical and physical geography and the teaching of mathematics.

**LA CROSSE**, a S. W. county of Wisconsin, separated from Minnesota by the Mississippi river, bounded N. W. by Black river, and drained by the La Crosse; area, 450 sq. m.; pop. in 1870, 20,297. The surface is undulating and generally well timbered, and the soil is fertile. The chief productions in 1870 were 581,485 bushels of wheat, 21,789 of rye, 192,503

of Indian corn, 286,126 of oats, 25,985 of barley, 66,526 of potatoes, 27,179 lbs. of wool, 182,501 of hops, 248,638 of butter, and 15,297 tons of hay. There were 3,486 horses, 4,438 milch cows, 5,231 other cattle, 9,288 sheep, and 4,408 swine; 2 manufactories of agricultural implements, 1 of boats, 3 of carriages, 1 of iron castings, 1 of machinery, 4 of saddlery and harness, 1 of sash, doors, and blinds, 5 of tin, copper, and sheet-iron ware, 1 of woollen goods, 4 breweries, 7 saw mills, and 1 bridge-building establishment. Capital, La Crosse.

**LA CROSSE**, a city and the capital of La Crosse co., Wisconsin, on the E. bank of the Mississippi river, at the mouth of the Black and La Crosse rivers, 105 m. W. N. W. of Madison and 175 m. W. N. W. of Milwaukee; pop. in 1860, 3,860; in 1870, 7,785; in 1874, including the village of North La Crosse annexed in 1871, estimated by local authorities at 13,000. It is finely situated on a level prairie, and has many handsome buildings, including the court house, which cost \$40,000, the post office, an opera house, and the high school building. It has ample railroad communication by means of the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, the La Crosse, Trempealeau, and Prescott, the Southern Minnesota, and the Chicago, Dubuque, and Minnesota lines. The city has an extensive trade in lumber, and contains a large manufactory of saddlery and harness, a plough factory, three foundries and machine shops, a grist mill, a large sash, door, and blind factory, several breweries, nine saw mills, and three banking houses. The United States courts for the W. district of Wisconsin hold one session here annually. There are flourishing graded schools, a young men's library of 2,400 volumes, two daily and five weekly (one German and one Norwegian) newspapers, a semi-monthly periodical, and 17 churches.—La Crosse was first laid out in 1851, though an establishment for trading with the Indians existed as early as 1841. It was incorporated as a city in 1856.

**LACTANTIUS, Firmianus**, one of the fathers of the Latin church, born, according to some, in Firmium, Italy, according to others, in Africa, about 260, died in Treves about 325. The names Lucius Cœlius or Cæcilius, sometimes bestowed on him, are not mentioned by Jerome and Augustine, or found in any ancient manuscript. According to his own account, he was born of heathen parents, and became a Christian at a mature age. Jerome calls him a pupil of the African Arnobius, under whom he studied rhetoric at Sicca, near Carthage. In early life he published in hexameters a work entitled *Symposion*, being a collection of riddles for convivial amusement. This work gained him such a reputation that he was invited by Diocletian in 301 to open a school of eloquence in Nicomedia, where he remained till 312. As this city was almost exclusively inhabited or visited by Greeks, Lactantius found but few pupils. During his stay there

the Christians were persecuted, and their religion assailed by the heathen philosophers. Having, it is surmised, become himself a Christian about this epoch, he wrote in defence of the persecuted creed his great work *Institutiones Divinae*, of which, while still in Nicomedia, he composed an epitome addressed to his brother Pentadius. This was followed by another entitled *De Opificio Dei*. In the former work Lactantius proposes to demonstrate the right of the Christian religion to exist legally, and to communicate its doctrines by public teaching; in the latter he grounds the belief in the existence of a God on the adaptations seen in every known form of organic life. In 312 Lactantius was called to Treves by the emperor Constantine, to superintend the education of his son Crispus. He appears to have lived in great poverty while in Nicomedia, and to have distinguished himself by his modesty and disinterestedness while at court. Before his conversion to Christianity, Lactantius had been a diligent student of the great Roman orator, whose harmonious and eloquent style he had labored so successfully to imitate that he acquired from posterity the appellation of the "Christian Cicero," and St. Jerome says that he was by far the most learned man of his age. Besides the works mentioned, he wrote a treatise *De Ira Dei*, which is still extant, two books to Asclepiades, and eight books of letters, which are lost. The work *De Mortibus Persecutorum* is thought by many of the best critics to belong to Lactantius, and to be identical with the work *De Persecutione Liber unus* mentioned as his by St. Jerome. The first edition of his works was printed at Subiaco in 1465; later editions are by Le Brun and Lenglet du Fresnoy (2 vols. 4to, Paris, 1748), Père Édouard de St. François Xavier (14 vols. 8vo, Rome, 1754-'9, considered the best), and in Gersdorf's *Bibliotheca Patrum Ecclesie selecta* (vols. x., xi., Leipsic, 1842).—See "A Summary of the Writings of Lactantius," by the Rev. J. H. B. Mountain (London, 1839).

**LACTIC ACID**, a product of the decomposition of any kind of sugar in solution, induced by the presence of certain albuminous ferments, as diastase exposed for some time in solution to the air. Milk contains both the elements for the production of this acid, sugar of milk and albuminous caseine. Its change to sour milk is called the lactic fermentation, and lactic acid is a product of this change. It was in sour milk that the acid was originally discovered by Scheele, whence he named it lactic; but it has since been obtained from the juices of many vegetables, and from the fluids of the stomach and flesh of animals. As milk turns, the coagulum which is formed is a combination of lactic acid and caseine. If the lactic acid be taken up by bicarbonate of soda, the caseine set free induces further fermentation, and more lactic acid is formed from the sugar of milk; and so by adding more soda the process may be kept up until all the sugar of milk is

converted into lactic acid. If a succeeding fermentation be allowed to take place, butyric acid is produced. The composition of lactic acid is expressed by the formula  $C_3H_5O_3$ , and it has the same centesimal composition as sugar of milk. When concentrated *in vacuo* over sulphuric acid, lactic acid is obtained in the form of a sirupy colorless fluid, of specific gravity 1.215 and very sour. At a temperature of 266° F. it yields water and becomes an anhydrous solid (dilactic acid), which dissolves sparingly in water, but readily in alcohol and ether. Lactide is a crystalline substance, of composition  $C_6H_8O_4$ , produced by subjecting the acid to a temperature of 482°; it is now called lactic anhydride.—In the animal economy lactic acid is thought to play an important part from its property of dissolving large quantities of freshly precipitated phosphate of lime; and this has led to its prescription in medicine with the view of its removing phosphatic deposits in the urine, as well as to hold in solution phosphate of lime when given as a medicine. It has also been recommended in certain forms of dyspepsia. It has been proposed as a local application to dissolve the false membranes of croup, being applied in liquid form, or as a spray from an "atomizer;" but the success obtained with this treatment by other observers has not equalled that claimed by the original proposer. The acid may be conveniently prepared by evaporating sour milk to one eighth its bulk, filtering, adding lime, again filtering, separating the crystals of lactate of lime which form, purifying these by redissolving and recrystallizing, and finally decomposing the salt by means of oxalic acid and recovering the lactic acid by filtering. But it is best obtained by dissolving 8 parts of cane sugar in about 50 parts of water, and fermenting by 1 part caseine and 3 parts chalk, and decomposing the lime salt by sulphuric acid.—The salts formed by this acid with bases are called lactates. The only important one is the lactate of iron, which is much employed in medicine as a stimulant and tonic. It is prepared by digesting lactic acid and iron filings at a gentle heat on a sand bath for five or six hours, and then allowing the liquor to boil. It is then filtered, concentrated, and allowed to cool and crystallize. The crystals are drained in a funnel, washed with alcohol, dried rapidly, and transferred to a bottle, which must be well stopped. Lactate of iron when pure is in white crystalline plates. It has an acid reaction, is soluble in 12 parts of boiling water, and the solution soon becomes yellow from the iron passing to a higher degree of oxidation. When sold in a powdered state, it is apt to be adulterated; for this reason it should be purchased in the crystals. The medicinal applications may be in the form of lozenges or sirup. In one of the Paris hospitals it has been introduced into bread, hence known as chalybeate bread, a grain of lactate of iron in each ounce, which does not injuriously affect the taste or

quality of the bread. This is given to patients suffering from chlorosis, and in other forms the medicine has proved beneficial in this disease. It is observed that it decidedly increases the appetite. Sarcolactic acid is the variety which is obtained from the juice of flesh; paralactic acid also exists.

**LACTOMETER.** See GALACTOMETER.

**LACUSTRIANS.** See LAKE DWELLINGS.

**LADAKH**, or **Middle Thibet**, a state of central Asia, subject to Cashmere, bounded N. by East Turkistan, E. by Great Thibet, S. and S. W. by the Punjab and Cashmere proper, and W. by Cashmere and Bulti; area, about 30,000 sq. m.; pop. about 150,000. The country is elevated and rugged, lying mostly between the Karakorum range and the western Himalayas. The river Indus flows N. W. between these ridges, its elevation here being nearly 11,000 ft. above the sea. The climate is cold and arid. The soil is sterile, but the slopes, being industriously cultivated, produce wheat, barley, buckwheat, apples, and apricots. The domestic animals are horses, yaks, cows, the zho (cross of the yak and the cow), asses, sheep, and goats. The sheep attain great size, and are used as beasts of burden in some parts of the country. Iron, lead, copper, and sulphur are found in considerable quantities. The people of Ladakh are mostly Thibetans. They are mild, good-humored, peaceable, and honest, but indolent, given to intoxication, and very sensual. Polyandry prevails among the lower classes. They carry on a trade in wool, used for the manufacture of Cashmere shawls. The country was formerly governed by independent despots, from whom it was wrested by Gholab Sing, the late rajah of Cashmere, in 1835. Capital, Leh.

**LADANUM**, or **Labdannum**, a resinous exudation of various evergreen shrubs of the genus *Cistus*, principally of the *C. Creticus*, found in the islands of the Grecian archipelago and the neighboring countries. The purer variety sometimes found in commerce is put up in bladders in masses of several pounds each. The substance readily softens and becomes adhesive in the hand. Externally it is dark red, almost black, and internally grayish. It diffuses an agreeable balsamic odor, and has a bitter and somewhat acrid taste. The common quality is very largely mixed with sand and other foreign matters; it is in spiral-shaped pieces of dark gray color, and hard and brittle. It contains only about 20 per cent. of resin, while in the purer quality 86 per cent. has been found; the other ingredients are gum and wax, with malate of lime, and in the common quality 72 per cent. of foreign substances. Ladanum, like many other similar drugs, has fallen into disuse; it was formerly employed in fumigation, and as a stimulant expectorant, and also as an ingredient of plasters.

**LADD**, **William**, an American philanthropist, born in Exeter, N. H., May 10, 1778, died in Portsmouth, April 9, 1841. He graduated at

Harvard college in 1797, and took an active part in organizing the American peace society, of which he was for many years president. In its interests he edited the "Friend of Peace," commenced by Dr. Noah Worcester, and the "Harbinger of Peace," and published a number of essays and occasional addresses on the subject of peace, including "An Essay on a Congress of Nations" (8vo, Boston, 1840). He carried his views to the extent of denying the right to maintain defensive war, and caused this principle to be incorporated into the constitution of the American peace society.

**LADINO**, a term applied throughout Central America, and particularly in Nicaragua and Guatemala, to the mestizo or half-breed descendants of whites and Indians. It was sometimes, though rarely, used by the royal governors and officers very nearly in the sense of *criollo* or creole, to distinguish Spaniards born in the country from those who had emigrated from the Peninsula. In the production of the ladino the white element has almost always been represented by the father, inasmuch as few women accompanied the first settlers on their voyage to America. The ladinos are for the most part of a yellowish orange tinge; the males more nearly approach to the European in form and feature than the females, in whom the Indian element predominates, but who may be said to be the handsomest women in Central America. The ladinos disdain all manual labor, and seek to adopt the same pursuits as the whites, with whom they desire to be confounded as much as possible; hence a multitude of candidates for a very limited number of government offices, the result of which is that the ladinos form a restless, turbulent class, to whom may be attributed in a great measure the civil wars and general insecurity of the Central American republics.

**LADISLAS** (Hun. *László*), Saint, king of Hungary (1077-95). See HUNGARY.

**LADISLAS** (Pol. *Władysław*) II., king of Poland, born in Lithuania about 1350, died in Grodek, near Lemberg, Galicia, May 31, 1434. He was the son of Olgerd and grandson of Gedimin, the grand dukes of Lithuania, and as a pagan prince, though the son of a Christian mother, received the name of Jagello or Jagiello. He succeeded his father in Lithuania, and in 1386, having married Hedvig, the beautiful and pious young daughter of Louis the Great, king of Hungary and Poland, became a Christian and received the Polish crown. He converted Lithuania to Christianity, and finally united it with Poland. He was successful in his wars against the Teutonic knights, whom he routed in the battle of Grünwald (1410). He greatly contributed to the development of the power of his kingdom, which was ruled by his dynasty down to 1572, when it became an elective state.—His son and successor, **LADISLAS III.**, having been elected king of Hungary (as Uladislas I.), waged war with the Turks, made peace with them, broke his oath, and fell

in the battle of Varna (1444). He was succeeded in Poland by his brother Casimir IV.

**LADMIRALTY, Louis René Paul de**, a French soldier, born in 1808. He graduated at Saint-Cyr in 1829, and rose in Algeria to the rank of brigadier general in 1848. He was wounded at the battle of Solferino in 1859. In 1866 he became senator, and in 1867 was put in command of the second army corps and of the camp of Châlons. During the Franco-German war he was at the head of the fourth corps, and took part in the battles around Metz. On the capitulation of that fortress he became a prisoner in Germany, and returned to France after the conclusion of peace in May, 1871. He took a conspicuous part as commander of the first corps under MacMahon in the operations against the commune, and on July 1, 1871, was appointed military governor of Paris, which post he still holds (1874). He has published *Bases d'un projet pour le recrutement de l'armée de terre* (1871).

**LADOGA**, a lake of Russia, the largest in Europe, surrounded by the governments of Viborg, Olonetz, and St. Petersburg, and lying between lat. 59° 58' and 61° 46' N., and lon. 29° 50' and 32° 55' E.; length 124 m., greatest breadth 87 m.; area, about 7,000 sq. m. It is 59 ft. above the sea. Its depth is very variable, being in some places upward of 150 fathoms, and in others too shallow for navigation. Its coast is generally low, much indented, and dangerous from hidden reefs. Its waters abound with fish. Storms are frequent and sudden, and the influx of 70 streams causes strong and uncertain currents. It is connected with Lake Onega by the river Svir, with Lake Ilmen by the Volkhov, and with the gulf of Finland by the Neva. It contains several islands, some of them inhabited; the largest are Valaam on the north and Konevets on the south. The principal towns on its coasts are Kexholm, Schlüsselburg, Serdobol, and Novaia (New) Ladoga. The Ladoga, Sias, and Svir canals form a continuous line around the S. and S. E. sides of the lake; and by the artificial union of several rivers and lakes vessels pass from the Baltic to the Volga and thence to the Caspian sea. There is communication also with the White sea.

**LADRONE, Marianne**, or **Mariana Islands**, a group of about 20 islands belonging to Spain, in the north Pacific ocean, N. of the Caroline islands, between lat. 13° and 21° N., and lon. 144° and 146° E.; area, 416 sq. m.; pop. about 10,000. When the Spanish missionaries sent by Queen Mariana, widow of Philip IV. of Spain, established themselves on the islands toward the end of the 17th century, the natives numbered 40,000. The present inhabitants are mostly descendants of settlers from Mexico and the Philippines. The islands are of volcanic formation, mountainous, well watered, and well wooded. The breadfruit, banana, and cocoanut grow to perfection, and the soil is productive in sugar, rice, corn, tobacco,

cotton, and indigo. The climate is salubrious, the heat being tempered by the trade winds. Horses, cattle, and llamas were early introduced by the Spaniards; wild hogs are numerous and very large. The principal islands are Guahan, Rota, Aguijan, Saypan or Seypan, and Tinian. Lord Anson visited Tinian in 1742, and found there cyclopean ruins. The seat of government is at San Ignacio de Agaña, on the island of Guahan, the most southerly of the group, where there is also a good fortified harbor. Asuncion and Pagon, in the north, are noted for their volcanoes. The general navigation is rendered dangerous by shoals and currents. A pearl fishery exists on the coast of Saypan. Magellan discovered the islands shortly before his death in 1521, and named them the Ladrones from the thievish disposition of the natives. They were afterward called the Lazarus islands, and in 1667, when the Jesuits settled there, they were renamed Marianne or Mariana in honor of the Spanish queen.—There are two other small groups called Ladrones: one in China, situated at the mouth of the bay of Canton, which is a resort of pirates; the other in the Pacific, 10 m. off the coast of Colombia.

**LADY** (Anglo-Saxon, *hláfdige*; Old Eng., *levedy*), a title used as the correlative of lord (A. S. *hláford*), or, in common speech, as the correlative of gentleman. It is supposed to have signified originally "bread-giver" (Goth. *hlaiþ*, loaf, and *dian*, to distribute), or "she who takes care of the bread" (A. S. *hláf*, loaf, and *weard*, to look after, to care for, to ward). The primary notion entertained of a chief or lord was that he was the provider of the food consumed by his family, and his lady had the care or distribution of it. Horne Tooke's derivation of the word from *hlifian*, to lift, *i. e.*, one raised to the rank of her lord, is untenable. As a title of honor in England, it belongs to peeresses, and to the wives of peers and of peers by courtesy, being prefixed in such cases to the peerage title. The daughters of dukes, marquises, and earls are designated by courtesy by the title, prefixed to their Christian and their surname. The wives of baronets receive it by courtesy, their legal designation being dame, and it is generally extended, also by courtesy, to the wives of knights of every degree. In Saxon times the queen was occasionally termed *ses hláfdig*, the lady, which is still preserved in the phrase "our sovereign lady the queen." In common usage the term is applied to any woman of the better class, and in the United States it has so lost its significance as to be given indiscriminately to almost any well dressed woman.—"Our Lady" is a title frequently applied to the Virgin Mary, generally in connection with some attribute, as "Our Lady of Mercy." Lady chapel, in cathedrals, is a chapel dedicated to the Virgin, and is usually placed east of the altar.—Lady day, in the calendar, is the 25th of March, being the Annunciation of the

Virgin Mary. In England and Ireland it is one of the regular quarter days, on which rent is made payable.

**LADY-BIRD** (sometimes called **LADY-BUG**), a small beetle of the trimerous division, and of the genus *coccinella* (Frisch). In this extensive and well known genus the body is hemispherical, the thorax very short, the antennæ composed of 11 joints and the tarsi of 8, the

Lady-Bird.

elytra convex, the under surface flat, and the legs short; the digestive canal is nearly straight, and as long as the body. The general colors are red, yellow, or orange with black spots, or black with white, red, or yellow spots. Many species have been described. The larvæ are small, bluish, flattened grubs, spotted with red or yellow, and with six legs on the anterior part of the body; they are hatched from yellowish eggs, of a disagreeable odor, laid usually in the spring in clusters among the *aphides* or plant lice. Both the larvæ and the perfect insects destroy immense numbers of these lice, and are therefore among the best friends of the agriculturist; when found upon plants they are in quest of their insect prey, and deprive vegetation of none of its juices, and they are entirely guiltless of producing the potato rot or any other similar disease. There are some very small lady-birds of a blackish color, and with a few short hairs, of the genus *scymnus*, whose larvæ are as savage among the plant lice as the lion among the smaller mammals.

**LADY'S SLIPPER**, the common name, corresponding to the generic one, of orchidaceous plants of the genus *cyprripedium* (Gr. *Κύπρις*, a name of Venus, and *πόδιον*, a sock), also sometimes called moccason flower. The genus and two other allied ones differ from other orchids in having two anthers instead of one; the sepals are three, two of them frequently united; petals three, of which the lower one, or lip as it is termed in orchids, is inflated to form a large sac, which in some species bears a resemblance to a slipper. To add to the ordinarily strange appearance of the flower, the lateral petals are in some of the exotics prolonged to form tails, which hang down for several inches below the lip. The genus has a wide range, from the tropics, where they have leathery and persistent leaves, to Canada and Siberia; the leaves of the northern ones are thin, and perish with the stem after flowering. Our commonest native lady's slipper is the stemless (*C. acavale*), which is found in woods, especially under evergreens, from the Carolinas to Canada, but is much more frequent northward; it has two large oblong leaves, from between which arises a stem, sometimes a foot high, bearing at its summit a single large flower, the lip of which, about 2 in. long, is beautifully veined with rose purple on a lighter or white ground. Two yellow-flowered species (*C. parviflorum* and *C. pubescens*), which differ but little except in size, are not rare in

bogs and woods; these have leafy stems 1 to 2 ft. high, and one to three flowers. The roots of these are used by herb doctors as antispasmodics under the name of nervine, nerve-root, &c. The ram's-head and small white lady's slipper (*C. arietinum* and *C. candidum*) are the

Lady's Slipper (*Cypripedium spectabile*).

rarest of our native species, and highly prized by botanists. The most beautiful of the American, and in some respects the finest of all cypripediums, is the showy lady's slipper (*C. spectabile*); though not very common, it grows in abundance in cold bogs in some localities upon the northern border, and extends along the mountains as far south as North Carolina. The stems, about 2 ft. high, as well as the numerous ovate leaves, are downy, and bear at the

Nepal Lady's Slipper (*Cypripedium insigne*).

summit one to three large flowers, of which the much inflated lip is white, and marked in front with pinkish purple, the color shading off much after the manner of the cheek of a well ripened peach. This species, so highly prized abroad, is seldom seen in cultivation in its native coun-

try; there is nothing in the whole range of hardy herbaceous plants that equals it in beauty, and it may be cultivated by any one who will imitate its natural locality by preparing a deep peaty soil for it. The same remark as to cultivation applies to all our species. Europe has but a single species, *C. calceolus*, which has a yellow lip netted with purple veins. The tropical and sub-tropical species and varieties of the greenhouse and stove are numerous; the best known of these is *C. insigne*, from Nepal, which has thick dark green leaves, and flowers spotted and mottled with yellow, green, and purple. An old plant of this forms a large clump with numerous flowers, which keep in perfection for several weeks; it is well suited to the greenhouse or conservatory, as is the somewhat similar *C. venustum*, which has broader and spotted leaves.

**LÆKEN**, a village of Belgium, a suburb of Brussels, with a royal palace built in 1782 by the Austrian princess Maria Christina. After the invasion of the French in 1792 it was to be converted into a hospital; but the archduke Charles acquired the property from his aunt, and sold it about 1794 to a surgeon. Napoleon bought it in 1806 for 500,000 francs, for Josephine, and in 1811 he resided here for some time with Maria Louisa. In 1812 he exchanged it for the Élysée Bourbon. Subsequently it became the property of Belgium, and the royal family reside here occasionally. Malibran is buried in the cemetery of Laeken, where her husband De Bériot had a monument erected to her by the sculptor Geefs. In the parish church are the tombs of Queen Louise and King Leopold I., and an extensive Gothic building is in course of erection as a vault for the royal family. The *allée verte* extends nearly all the way from Laeken to Brussels.

**LÆLIUS. I. Caius**, a Roman general, born about 235 B. C. He commanded the fleet which captured New Carthage, in Spain, 210 B. C. He was the friend of Scipio, and commanded the left wing of his army at the battle of Bœcula, 208, and afterward with a detachment of the fleet defeated Adherbal in the straits. He was sent twice to the court of Syphax. Near the close of the second Punic war he sailed with a portion of the fleet to the African coast, landed at Hippo Regius, and began to plunder the country, but soon returned to Messana, from an apprehension that the Carthaginians were cutting off his retreat. In 204, with Masinissa, he burned the Punic and Numidian camps and pursued Hasdrubal and Syphax, and in 203 captured the latter and his capital Cirta. He commanded the Italian cavalry at the battle of Zama, and his charge determined the victory. He was chosen prætor in 196, and consul in 190. Afterward he obtained the province of Cisalpine Gaul, which he held for two years, and was sent on several important missions by the senate. The date of his death is unknown. **II. Caius Sapiens**, a Roman statesman, son of the preceding, born about 186

B. C., died about 115. He was tribune of the people in 151, prætor in 145, and consul in 140. Before his consulship he was assigned the province of Lusitania, and conducted a successful campaign against the formidable guerilla chief Viriathus. At the beginning of his political career Lælius inclined to that party which sought to raise the masses to the condition of landed proprietors; but the excitement and violence occasioned by the measures of the elder Gracchus so alarmed him that he withdrew from the popular side, and supported the aristocracy. In 132 he aided the consuls against the partisans of Tiberius Gracchus, and in 130 he opposed the passing of the Papirian rogation. For his course in that period, his friends and faction honored him with the cognomen of *Sapientis*, or the Wise. In common with the younger Scipio, he had early applied himself to the language and learning of Greece, and had imbibed the doctrines of the Stoics from Diogenes of Babylon and Panætius. He is the Lælius of Cicero's *De Amicitia*, *De Senectute*, and *De Republica*.

**LAEMLEIN, Alexandre**, a French painter, born at Hohenfeld, Bavaria, Dec. 9, 1813. He went to Paris in his 10th year, to live with his uncle Alexandre Laemlein, the author of a cyclopædia of chess, and became a naturalized French citizen in 1848, and professor of drawing at the special school of design in 1855. His works include many historical portraits at Versailles, and many large paintings, as "The Chastity of Joseph," "The Awakening of Adam," and "Tabitha resuscitated by St. Peter." The last was purchased by the government for the church of Saint Pierre de Gobert near Agen, where it has become a shrine for pilgrims. His "Charity," "Jacob's Ladder," and "Vision of Zacharias" are all powerful paintings, which were much admired at the exhibition of 1855. Among his later works are "Music" (1852), "Diana and Endymion" (1857), "Job" (1857), "The Love of Angels" (1863), "Orpheus" (1866), and "Hope" (1868).

**LAENNEC, René Théodore Hyacinthe**, a French physician, born in Quimper, Brittany, Feb. 17, 1781, died there, Aug. 13, 1826. In 1800 he went to Paris, and attached himself to the clinical school of the charity hospital, then directed by Corvisart. He obtained the degree of M. D. in 1814, and became principal editor of the *Journal de Médecine*. In 1816 he was appointed chief physician of the Necker hospital, where he soon after discovered mediate auscultation; and in 1819 he published his *Traité de l'auscultation médiate et des maladies des poumons et du cœur* (translated by Dr. Forbes of Chichester). In 1821 he was appointed professor of medicine in the collège de France, but ill health soon compelled him to resign.

**LAER, or Laar, Pieter van**. See BAMBOCOCCIO.

**LAFARGE, Marie Cappelle**, a French woman notorious for her condemnation as a poisoner, born at Villers-Hellon, Aisne, in 1816, died at Ussat, a watering place in the Pyrenees, Nov.

7, 1852. She belonged to a good family, and was accustomed to all the refinements of Parisian life. In 1838 she married Pouch-Lafarge, an owner of iron works at Glandier, in the department of Corrèze, who represented himself as a wealthy country gentleman; but being disappointed in her expectations, she quarrelled with him and exhibited the utmost rancor toward him. After about 16 months her husband was seized with a strange illness, and within a fortnight he died. Strong suspicion fixed upon Madame Lafarge, who, it was proved, had twice purchased arsenic under pretence of killing rats. She was arrested, and when in confinement was charged by one of her relations with having stolen a set of diamonds; and these having been found in her possession, she was sentenced to two years' imprisonment (April, 1840). Not daunted by this, she represented herself as the victim of a deep-laid conspiracy, and declared her innocence of both robbery and poisoning. The public at home and abroad became interested in her case. She secured the services of three eminent advocates; and the evidence against her was so slight that a verdict of acquittal was confidently expected, when the celebrated Orfila, who had made a chemical examination of the body of the deceased, reported evidences of poison. Madame Lafarge was found guilty and sentenced to hard labor for life (September, 1840). Public opinion was still divided. The chemist Raspail impugned the report of Orfila, and a bitter controversy ensued. The convict, incarcerated at Montpellier, published her *Mémoires* (4 vols. 8vo, 1841-'2), and continued to receive marks of sympathy. After five years of imprisonment she was permitted to remove to the convent of St. Rémy, and the interest manifested in her behalf on account of her failing health contributed to procure her liberation in June, 1852. She removed to Ussat, where she soon died protesting her innocence. Her *Heures de prison*, containing her thoughts during her confinement, was published after her death (3 vols. 8vo, 1853).

**LA FARINA, Giuseppe**, an Italian author, born in Messina in 1815, died in September, 1863. He early wrote in the liberal interest, and fled from Sicily in 1837; being again molested after his return there in 1839, he resided in Florence till 1848, when he became a member of the Sicilian parliament and cabinet under the republican government, retiring to Turin in 1849. In 1861 he was elected to the Italian parliament as a representative of Palermo, and Rattazzi appointed him president of the national Italian society. His works include illustrated books of travel, "Souvenirs of Rome and Tuscany," several dramas, and histories of the Sicilian revolution of 1848-'9 (2 vols.) and of Italy from 1815 to 1850 (6 vols.), the latter being his most important publication.

**LAFAYE, or Lafait, Prosper**, a French painter, born at Mont Saint-Sulpice, Yonne, in 1806. He was at first a landscape and subsequently

a historical painter. Many of his works are at Versailles, including "The Masked Ball," one of his best. At the exhibition of 1855 he showed two paintings illustrating the maxims of La Bruyère. For more than 20 years he has been almost exclusively occupied in the decoration of windows.—His brother, PIERRE BENJAMIN (1808-'67), published *Synonymes français* (1841), for which he received a prize, and *Dictionnaire des synonymes de la langue française* (1858; supplement, 1865).

**LAFAYETTE**, the name of six counties in the United States. **I.** A N. county of Florida, bordering on the gulf of Mexico, and bounded E. and N. E. by the Suwannee river; area, 900 sq. m.; pop. in 1870, 1,783, of whom 197 were colored. The surface is level. The chief productions in 1870 were 28,455 bushels of Indian corn, 10,180 of sweet potatoes, 192 bales of cotton, 12 hogsheads of sugar, and 3,269 gallons of molasses. There were 200 horses, 2,020 milch cows, 4,198 other cattle, and 5,619 swine. Capital, McIntosh. **II.** A N. county of Mississippi, drained by Tallahatchee river and its tributary the Yocknapatafka; area, 790 sq. m.; pop. in 1870, 18,802, of whom 7,983 were colored. It has a rolling surface, covered in places with small tracts of timber. The soil is fertile. The Mississippi Central railroad passes through it. The chief productions in 1870 were 17,864 bushels of wheat, 470,305 of Indian corn, 23,772 of sweet potatoes, and 9,007 bales of cotton. There were 2,334 horses, 2,322 mules and asses, 4,515 milch cows, 1,016 working oxen, 6,832 other cattle, 6,281 sheep, and 31,514 swine; 2 tanneries, 2 currying establishments, 7 saw mills, and 1 wool-carding establishment. Capital, Oxford. **III.** A S. parish of Louisiana, traversed by Vermilion river, which is navigable by steamboats; area, 350 sq. m.; pop. in 1870, 10,388, of whom 4,755 were colored. The surface is level and the soil rich and alluvial. The principal productions in 1870 were 238,020 bushels of Indian corn, 47,043 of sweet potatoes, 14,385 lbs. of wool, 40,166 of butter, 221,600 of rice, 6,234 bales of cotton, 128 hogsheads of sugar, and 6,715 gallons of molasses. There were 4,322 horses, 944 mules and asses, 4,804 milch cows, 1,883 working oxen, 10,171 other cattle, 6,881 sheep, and 6,814 swine; 9 manufactories of carriages, 6 of molasses and sugar, and 2 saw mills. Capital, Vermillionville. **IV.** A S. W. county of Arkansas, bordering on Louisiana and Texas, and traversed by Red river and its Sulphur fork; area, 1,260 sq. m.; pop. in 1870, 9,139, of whom 5,158 were colored. It has a good soil and a level surface, consisting partly of prairie. The chief productions in 1870 were 247,004 bushels of Indian corn, 22,303 of sweet potatoes, and 9,572 bales of cotton. There were 1,406 horses, 1,476 mules and asses, 2,779 milch cows, 3,494 other cattle, 1,392 sheep, and 11,466 swine. Capital, Lewisville. **V.** A S. W. county of Wisconsin, bordering on Illinois and drained by Fèvre and Pekatonica

ivers; area, 630 sq. m.; pop. in 1870, 22,659. It has an undulating surface, thinly timbered. In the N. W. part are several regular hills called the Platte mounds. Lead, copper, and limestone are abundant. The soil is fertile. The Mineral Point railroad crosses the county, and the northern division of the Illinois Central skirts the southern border. The chief productions in 1870 were 516,900 bushels of wheat, 1,294,453 of Indian corn, 1,519,202 of oats, 75,802 of barley, 198,327 of potatoes, 33,538 of flax seed, 65,089 lbs. of wool, 689,335 of butter, 22,760 of cheese, and 38,749 tons of hay. There were 10,353 horses, 10,461 milch cows, 18,412 other cattle, 18,770 sheep, and 35,482 swine; 14 manufactories of carriages, 2 of pig lead, 5 of saddlery and harness, and 6 flour mills. Capital, Darlington. **VI.** A W. county of Missouri, bounded N. by the Missouri river and drained by a number of small streams; area, 450 sq. m.; pop. in 1870, 22,622, of whom 4,039 were colored. The Lexington branch of the Missouri Pacific railroad passes through it. The surface is undulating and well timbered. Limestone, sandstone, and coal are abundant, and the soil is remarkably fertile. The chief productions in 1870 were 421,567 bushels of wheat, 1,576,126 of Indian corn, 268,881 of oats, 91,345 of potatoes, 113,735 lbs. of tobacco, 33,100 of wool, 154,045 of butter, and 7,292 tons of hay. There were 6,983 horses, 2,760 mules and asses, 5,541 milch cows, 11,237 other cattle, 12,244 sheep, 33,334 swine, and a number of manufactories. Capital, Lexington.

**LAFAYETTE**, a city and the county seat of Tippecanoe co., Indiana, at the head of navigation on the E. bank of the Wabash river, 60 m. N. W. of Indianapolis; pop. in 1850, 6,129; in 1860, 9,387; in 1870, 13,506, of whom 3,639 were foreigners; in 1874 estimated by local authorities at 22,000. It is built on rising ground, enclosed in the rear by hills of easy ascent, commanding a fine view of the river valley. It contains many handsome buildings, and has paved streets lighted with gas. Near the centre of the city is a public square containing an artesian well 230 ft. deep, from which issues sulphur water possessing curative properties. To the north and northeast are Greenbush and Springvale cemeteries, handsomely situated and adorned with trees. The battle ground of Tippecanoe, where Gen. Harrison defeated the Indians, Nov. 7, 1811, is 7 m. N. of the city; and just S. of the limits are the agricultural fair grounds of the county. Lafayette is on the line of the Wabash and Erie canal, and at the intersection of the Lafayette, Muncie, and Bloomington, the Cincinnati, Lafayette, and Chicago, the Louisville, New Albany, and Chicago, the Indianapolis, Cincinnati, and Lafayette, and the Toledo, Wabash, and Western railroads, by means of which and the river it commands the trade of a rich and extensive country. There are a number of important manufactories, embracing founderies and ma-

chine shops, ornamental iron works, breweries, marble works, flouring mills, plough works, reaper works, woollen mills, pump factories, cooperages, &c. Pork packing is extensively carried on. There are five national banks, with an aggregate capital of \$2,505,000, and two savings banks. The city is divided into six wards, is governed by a mayor and council of 12 members, and has a police force and a fire department. The county jail, erected in 1869 at a cost of \$95,000, is a substantial structure. The city contains several hotels, a home for the friendless, and an opera house which cost \$62,000. Lafayette is the seat of Purdue university, named in honor of John Purdue, who gave it \$150,000 and 100 acres of land. It also received the proceeds (\$212,238) of the congressional land grant for a state college of agriculture and the mechanic arts, and the state and county have aided it by donations amounting to \$110,000. The buildings already

of the American revolution and a French statesman, born at the château of Chavagnac, near Brioude, Sept. 6, 1757, died in Paris, May 20, 1834. His family was one of the most ancient and eminent in the French nobility. His father, the marquis de Lafayette, was an officer of the army, and fell in battle in Germany at the age of 25. His mother died soon afterward, and he was thus left in infancy heir to a large estate. At an early age he was sent to the college of Plessis at Paris, and when only 16 married a lady still younger, a daughter of the count d'Ayen, son of the duke de Noailles. He entered the army as an officer of the guards, and in 1776 was stationed at Metz with his regiment, in which he was a captain of dragoons. At a dinner given by the commandant of the garrison to the duke of Gloucester, brother of the king of England, who was then on a visit to Metz, Lafayette heard that the American colonies had declared their independence. Be-

fore he left the table he had mentally resolved to draw his sword in the cause of American liberty, and he immediately went to Paris to make arrangements for the execution of his plan. He became acquainted with the American agents in Paris, Franklin, Deane, and Arthur Lee, and communicated to them his intention of proceeding to America. This was at the darkest period of the revolutionary war, and the news had just reached France of the occupation of New York, the loss of Fort Washington, and the disastrous

Purdue University Building.

erected, at a cost of \$110,000, are the dormitory, boarding house, laboratory, gymnasium, military hall, manufacturing shop, power and gas house, and janitor's residence. The university building proper is in process of construction, and will cost \$75,000. The institution has 184 acres of land connected with it. St. Mary's academy (Roman Catholic) has about 300 pupils, and there are several other Catholic schools. There are five public school buildings, the Ford school house, erected in 1869 at a cost of \$85,000, being the finest. The young men's Christian association has a free reading room and library. Three daily, one semi-weekly (German), and four weekly newspapers are published, and there are 24 churches.—Lafayette was laid out in 1825, and received a city charter in 1857. It is becoming a favorite place of resort for invalids and tourists.

**LAFAYETTE, or La Fayette, Marie Jean Paul Roch Yves Gilbert Motier, marquis de, a general**

retreat of the Americans through New Jersey. The cause of America looked desperate, and the few friends whom Lafayette had apprised of his design urged him to abandon it. Even the American commissioners told him they could not in conscience urge him to go; they had not the means even to give him a passage across the Atlantic. But he replied that the more desperate were the affairs of the Americans, the more necessary was there for giving them assistance; and as for passage, he would purchase a vessel for himself and his companions. He accordingly caused a vessel to be secretly fitted out at Bordeaux. While his preparations were going on, to avert suspicion from himself, he made a visit to his kinsman the marquis de Noailles, then French ambassador in London; but while in Great Britain he scrupulously abstained from using the opportunity afforded of obtaining military information that might be of service to the Ameri-

cans. At the end of three weeks he returned to France, and without passing through Paris hastened to Bordeaux. Here he learned that the British ambassador at Paris had penetrated his design, and that the government had given orders for his arrest. Though his ship was not quite ready, he instantly made sail for Pasages, the nearest port in Spain, where he had scarcely arrived when he was waited upon by two French officers with an order from the king of France directing him to go to Marseilles. They also brought letters from his relatives censuring his conduct, and requesting him to return home; but his wife, who was devotedly attached to him, and who shared his enthusiasm for American liberty, wrote urging him to stand firm and to proceed on his enterprise. He returned with the officers to Bordeaux by land, leaving his vessel at Pasages, and in apparent obedience to the royal command set out for Marseilles; but soon after leaving Bordeaux he took the road to Spain, and, though closely pursued, reached Pasages, where he instantly put to sea. He was accompanied by 11 officers, among them the German veteran Baron de Kalb. His departure created a great sensation not only in France but in England. The passage to America was long and stormy, and there was much danger from the English cruisers on the coast. Lafayette and his companions, however, landed in the night near Georgetown, S. C., and, though at first taken for a party of the enemy, were at length received and hospitably entertained in the house of Major Huger, who conveyed them the next day, April 25, 1777, to Charleston, where they were received with enthusiasm. "The sensation produced by his appearance in this country," says Mr. Ticknor, "was, of course, much greater than that produced in Europe by his departure. It still stands forth as one of the most prominent and important circumstances in our revolutionary contest; and, as has often been said by one who bore no small part in its trials and success, none but those who were then alive can believe what an impulse it gave to the hopes of a population almost disheartened by a long series of disasters." Lafayette proceeded by land to Philadelphia, where congress was then in session, and on his arrival addressed a letter to the president of that body, asking leave to enter the army as a volunteer and to serve without pay. Congress expressed its high sense of the value of his example and of his personal worth by the following resolution: "Whereas the marquis de Lafayette, out of his great zeal to the cause of liberty, in which the United States are engaged, has left his family and connections, and at his own expense come over to offer his services to the United States, without pension or particular allowance, and is anxious to risk his life in our cause: Resolved, that his services be accepted, and that, in consideration of his zeal, illustrious family and connections, he have the rank and

commission of major general in the army of the United States." His commission was dated July 31, 1777, while he yet lacked more than a month of being 20 years old. Congress considered the appointment merely honorary; but it speedily became apparent that Lafayette was bent on serious service, and was well qualified to command. Washington and Lafayette met for the first time at a dinner party in Philadelphia. Lafayette made a highly favorable impression, and at the close of the entertainment Washington took him aside, thanked him warmly for the sacrifices he had made in the American cause, and invited him to regard himself at all times as a member of his military family. The personal acquaintance thus commenced soon ripened into an intimacy that was never for a moment interrupted. The private correspondence of Washington shows that he not only felt for Lafayette the warmest affection, but entertained the highest opinion of his military talent, personal probity, and general prudence and energy. The youthful major general was first in active service at the battle of Brandywine, Sept. 11, where he had no separate command, but was attached to the staff of Washington as a volunteer. He plunged into the hottest of the fight, and when the defeated Americans began to retreat, threw himself from his horse, entered the ranks, and exerted himself to rally them. He was shot by a musket ball through the leg, but was unconscious of the wound till his aide told him that the blood was running from his boot. He rode with a surgeon to Chester, but would not suffer his wound to be dressed till he had restored order among the troops who were retreating in confusion through the village. It was two months before his hurt was sufficiently healed to enable him to join the army. On Dec. 1 congress resolved "that Gen. Washington be informed that it is highly agreeable to congress that the marquis de Lafayette be appointed to the command of a division in the continental army." This resolve was passed at the request of Washington himself, who three days afterward directed Lafayette to take command of the division of Gen. Stephen, who had been dismissed. About this period the board of war, of which Gates was the head and which had been created and was controlled by the faction hostile to Washington, planned an expedition to Canada which was approved by congress; and Lafayette was appointed to the command in the expectation that so flattering a distinction would attach him to the party by whom it was conferred. The first intimation that Washington had of the project was from the letter to Lafayette announcing his appointment. The young Frenchman, indignant at the slight offered to his chief in not consulting him, carried the letter immediately to Washington, told him he saw through the artifice, and would be governed by his advice. Washington advised him to accept the appointment, but told him he did not know where the means could

be found to carry out such an expedition. Lafayette accordingly accepted the command, and proceeded to Albany, the designated headquarters of the expedition; but after waiting three months for the promised force and supplies, during which period he took measures for putting the Mohawk valley in a state of defence, he at length received orders from congress to join the army at Valley Forge, and to suspend the invasion of Canada. He returned to the camp in April, 1778, and on May 18 was despatched by Washington from Valley Forge to Barren Hill, 12 m. distant, where he took post with 2,100 men and five pieces of cannon. Sir Henry Clinton, the British commander at Philadelphia, on the night of May 19 sent Gen. Grant with 5,000 men to surprise Lafayette. The negligence of the militia outposts permitted the British to approach within a mile before they were discovered, and early in the morning Lafayette found himself nearly surrounded. But a dexterous stratagem and a skilful movement, promptly conceived and executed, baffled the British general, and conveyed the Americans with their artillery safely across the Schuylkill and back to Valley Forge. His conduct in this affair called out the warmest expressions of approbation from Washington. At the battle of Monmouth, June 28, Gen. Lee, to whom as next in rank to the commander-in-chief the command of the advanced forces belonged, refused at first to take it, and Washington gave it to Lafayette; but Lee subsequently changed his mind and applied to be reinstated, to which Lafayette assented with his accustomed grace and disinterestedness, and served under Lee during the battle, in which he displayed great gallantry. Seeing at one point of the engagement a good opportunity to attack the enemy with his division, he rode up to Lee and asked permission to make the attempt. "Sir," replied Lee, "you do not know British soldiers; we cannot stand against them." Lafayette replied: "It may be so, general; but British soldiers have been beaten, and they may be again; at any rate I am disposed to make the trial." Lee gave him permission to attack, which he did with vigor and success until Lee, on beginning the "unnecessary, disorderly, and shameful retreat" for which he was afterward punished by court martial, ordered him to fall back. A few weeks later Lafayette was sent with two brigades of infantry to assist Gens. Greene and Sullivan in the attempt to drive the British from Rhode Island, in which they had at first the assistance of a French fleet under Count d'Estaing, France having now declared war against England and formed an alliance with the United States. D'Estaing, however, before anything of importance was effected, withdrew with his fleet to Boston harbor for repairs, in spite of the remonstrances of the American generals. Lafayette was despatched to Boston to persuade him to return to Newport, but could only get a promise from him that if required he would march his marines by land to

the aid of the Americans. During Lafayette's absence an engagement took place, Aug. 29; and though he rode from Boston to Rhode Island, 70 m., in 6½ hours, he arrived only in time to assist in conducting the retreat from the island, which the American commanders had decided upon, on learning of the approach of the British fleet with a fresh army on board. The good understanding between the French and American troops had been somewhat impaired by the conduct of D'Estaing, and Lafayette was of essential service in restoring harmony.—His own country being now at war, Lafayette, who still retained his commission in the French army, deemed it his duty at the end of the campaign of 1778 to return to France and place himself at the disposal of his government, and at the same time to exert himself in behalf of America by personal conferences with the French ministry. At the request of Washington, congress granted him leave of absence, accompanied by complimentary resolutions, and by a letter recommending him to the good offices of the American minister in Paris. Congress also voted him a sword. After a detention at Fishkill by severe illness, he embarked for France at Boston in January, 1779. He was received with extraordinary demonstrations of popular enthusiasm by all classes of society. His name, introduced into dramatic performances, called out acclamations at the theatres; he was followed by crowds in the streets wherever he went; he made a journey to one of his estates in the south of France, and all the towns through which he passed received him with processions and civic honors; and in the city of Orleans he was detained nearly a week by prolonged festivities in honor of his return. Amid the admiration and flattery with which he was surrounded he did not neglect the interests of America. It was mainly his personal efforts that caused the army of Rochambeau to be sent to America. "It is fortunate for the king," said the old count de Maurepas, the head of the ministry, "that Lafayette did not take it into his head to strip Versailles of its furniture to send to his dear America, as his majesty would have been unable to refuse it." Having procured for the United States assistance both with men and money, Lafayette, on May 11, 1780, rejoined Washington at the headquarters of the army, bringing himself the first intelligence of his success. He brought also a commission from Louis XVI. appointing Washington a lieutenant general of the army of France and vice admiral of its navy, a measure intended, as it afterward operated, to prevent difficulties respecting official etiquette between the French and American commanders. A French fleet bringing Rochambeau and 6,000 soldiers arrived at Newport July 10, and Washington despatched Lafayette to concert measures with Rochambeau for future operations. Soon after his return he was stationed at Tappan on the Hudson in command of six battalions of light

infantry, watching the movements of the British under Sir Henry Clinton, with whom Arnold, then in command at West Point, was secretly negotiating for the betrayal of that important fortress. Arnold made an attempt to obtain from Lafayette the names of the spies he maintained in New York city, on pretence that intelligence from them might often be conveyed more expeditiously by way of West Point; but Lafayette declined to communicate them. Lafayette was one of the court of 14 general officers, convened at Tappan, Sept. 29, by whom Major André was tried as a spy and condemned to death. During Arnold's invasion of Virginia in the beginning of 1781, Washington sent Lafayette, Feb. 20, with 1,200 men of the New England and New Jersey lines, to assist in the defence of that state. They arrived at Annapolis in a state of great destitution, without shoes, hats, or tents. The United States having neither money nor credit, he purchased for them a full supply with his own funds. His presence inspired the militia of Virginia with fresh hope, and his force was soon doubled in numbers. Toward the end of May Lord Cornwallis took command of the British in Virginia, and, with his usual energy, on the fourth day after his arrival he marched to attack Lafayette, who with about 3,000 troops was then encamped in the neighborhood of Richmond. Confident in his superiority of numbers, Cornwallis was so sure of success that he wrote home, "The boy cannot escape me." Lafayette, however, made a skilful retreat to the northward, and, though pursued with unusual activity, made his way safely to the Raccoon ford on the Rappahannock in Culpeper county, where he was joined by Gen. Wayne, who had marched from Maryland to his assistance with 800 men. Lafayette then advanced, and interposed himself in a strong position near Charlottesville between the British army and some large quantities of stores removed from that town on the enemy's approach. Cornwallis marched off toward Williamsburg, pursued by Lafayette, a portion of whose troops overtook the British, July 6, at the Jamestown ford, where a sharp action was fought. Continuing his retreat, Cornwallis at last took post at Yorktown. Lafayette stationed his army so as to cut off their retreat into the Carolinas, and awaited the reinforcements from the north, which came a few weeks later under the command of Washington and Rochambeau. For his services during the siege of Yorktown, where in conjunction with Hamilton he commanded one of the assailing parties, he was publicly thanked by Washington on the day after the surrender of Cornwallis.—At the close of the campaign he returned to France. In granting him leave of absence, congress passed resolutions acknowledging his eminent services, and directing all the ministers of the United States in Europe to confer and correspond with him. He was received with the highest enthusiasm

in France, and his request for additional men and money for service in America was readily complied with. The enthusiasm spread from France to Spain, and an expedition of 60 vessels of the line and 24,000 troops was organized to sail from Cadiz under the command of Lafayette, who led 8,000 men from Brest to Cadiz. Soon after his arrival he heard of the conclusion of peace at Paris; and from a letter which he sent from Cadiz, Feb. 5, 1783, congress first learned the news of the treaty. In 1784, at the invitation of Washington, he revisited the United States, landing at New York Aug. 4, and proceeded almost immediately to Mount Vernon. He subsequently visited Annapolis, Baltimore, Philadelphia, New York, Albany, and Boston, receiving everywhere the warmest testimonials of affection and respect. On his departure in December, congress appointed a solemn deputation of one member from each state to take leave of him on behalf of the whole country. In the year after his return to France he visited Germany, where he was received with much distinction. Frederick the Great paid him marked attention, and took him with him on a military tour of inspection and review. For some years he now occupied himself with efforts to ameliorate the political condition of the French Protestants, and in promoting the abolition of slavery in the colonies. He purchased a plantation in Cayenne, emancipated the slaves, and expended a large sum in their education. The assembly of the notables at Paris, Feb. 22, 1787, was the first step in the French revolution. Of that assembly Lafayette was a member, and contributed essentially to give character to its deliberations. He stepped forth at once the champion of the people, denounced the abuses of the government, proposed the abolition of private arrests and of the prisons of state, the restoration of Protestants to equal privileges of citizenship, and the convocation of the states general. "What!" said the count d'Artois, the brother of the king, and afterward king himself as Charles X., "do you demand the states general?" "Yes," replied Lafayette, "and something better than that." The states general, which soon became the constituent assembly, met May 5, 1789. According to Jefferson, its initiatory movements were concerted by Lafayette and a small circle of friends at the hotel of Jefferson himself. He proposed in this body a declaration of popular rights not unlike that of the American declaration of independence; and by his influence on the night of July 13, while the Bastille was falling before the people, the decree providing for the responsibility of the royal ministers was carried through. Two days afterward he was appointed commander-in-chief of the national guards of Paris, an organization which rapidly extended throughout the kingdom until it embraced 3,000,000 men. It was at his suggestion that the tricolor was adopted, July 26; an emblem destined, as he said, to make

the tour of the world. His influence was now at its height, and while he retained it, it was always exercised on the side of moderation, humanity, and constitutional liberty. A loyal subject, though in principle a firm republican, he defended the freedom of the king as sincerely as he had ever defended that of the people. His courage and coolness during the tumults of Oct. 5 and 6 saved the lives of the king and queen from a ferocious mob that had taken possession of the palace of Versailles. When the national assembly decreed the abolition of feudal titles, Lafayette was among the first to lay down that of marquis, which he never resumed; and the only title which he bore till his death was that of general, which he derived from his commission in the American army. After the splendid and imposing ceremony of the adoption of the constitution, July 14, 1790, in the Champ de Mars, where, in the presence of half a million of people, he took the oath to its support in the name of the nation, he resigned his command of the national guards in an able and patriotic letter, and retired to his estates in the country. When war was declared against Austria, March 20, 1792, he was appointed to the command of one of the armies sent to guard the frontier. He established discipline, and won victories at Philippeville, Maubeuge, and Florennes. But the Jacobins, who were now becoming predominant in France, hated and feared him, and orders were sent to the camp from the ministry of war designedly to embarrass and annoy him. In return he addressed a letter to the assembly denouncing the Jacobins as enemies of the constitution and the people. A majority of the assembly and the local assemblies of 75 of the departments gave their formal sanction to his views. But violence at length prevailed, and on Aug. 8 he was denounced in the assembly as an enemy of the nation, and a motion was made for his arrest and trial. After vehement debates it was lost by a majority of 406 to 224. But the terrible events of Aug. 10 soon followed, and the reign of terror was established. Commissioners were sent to the army with orders to arrest Lafayette. Arrest at that period was certain death. He saved himself by flight, after placing the army in such a position that his departure could not expose it to danger. He crossed the frontier Aug. 17, intending to take refuge in Holland. But he was seized the same night by an Austrian patrol, and being soon recognized was treated as a criminal and exposed to disgraceful indignities. He was handed over to the Prussians because their prisons were near at hand, and was at first confined at Wesel and afterward at Magdeburg. But the Prussians, unwilling to bear the odium of holding Lafayette a prisoner, soon transferred him again to the Austrians, who consigned him to damp and dark dungeons in the citadel of Olmütz. Here he was told that he would never again see anything but the four walls of his prison;

that he would never receive news of events or of persons; that his name would be unknown in the citadel, and that in all accounts of him sent to court he would be designated only by a number; that he would never receive any notice of his family, or of the existence of his fellow prisoners. At the same time knives and forks were kept from him, as he was officially informed that his situation was one which would naturally lead to suicide. The want of air and of proper food, and the dampness and filth of his dungeon, brought on dangerous diseases, of which his jailers took no notice; and at one time all his hair came off. His friends for a long time could get no intelligence of his fate; but at length Dr. Eric Bollmann, who was employed by Count Lally-Tolendal, and who had established himself for the purpose as a physician at Vienna, ascertained that he was confined at Olmütz. The military physician at Olmütz by this time had thrice made a formal representation to the Austrian government that Lafayette would die unless he was allowed to breathe a purer air. To the first application the reply was made that "he was not sick enough yet;" but at length the outcry of public indignation in Europe compelled the authorities to grant him permission to ride out occasionally in a carriage accompanied by two soldiers. Dr. Bollmann and a young American travelling in Austria, Francis K. Huger, then planned a rescue, which proved so far successful that Lafayette escaped from the prison, but through a misunderstanding rode in the wrong direction, was rearrested, and confined with redoubled severity. (See BOLLMANN.) Meantime his wife, who had been imprisoned at Paris during the reign of terror, obtained her liberty on the downfall of Robespierre. She then went to Vienna, obtained with difficulty a personal interview with the emperor Francis, and gained permission to share her husband's captivity, under the hardship of which her health soon became so impaired that she never fully recovered from its effects. Great exertions were now made both in Europe and America to obtain the release of Lafayette. In the house of commons Gen. Fitzpatrick, Dec. 16, 1796, made a motion in his behalf, which was supported by Col. Tarleton, who had fought against Lafayette in America, by Wilberforce, and by Fox. President Washington wrote a letter to the emperor, asking for the liberation of his old companion in arms. The Austrian government was deaf to all entreaties. But an advocate now appeared whose plea was irresistible. Bonaparte at the head of his victorious army demanded the release of Lafayette in the preliminary conferences held at Leoben before the treaty of Campo Formio. He was often afterward heard to say that in all his negotiations with foreign powers he had never experienced so pertinacious a resistance as that which was made to this demand. The Austrian negotiators attempted to compel Lafayette to receive

his freedom clogged with conditions; but he firmly replied that he would never accept his liberation in any way that should compromise his rights and duties, either as a Frenchman or as an American citizen. He was set free at last, Sept. 19, 1797, after five years of imprisonment, 22 months of which had been shared by his wife. The unsettled condition of France still precluded his return to his native country, and he took up his residence in Holstein, where he lived in retirement, occupying himself with agriculture, until toward the end of 1799, when he removed to his estate of La Grange, a fine old château about 40 m. from Paris. Here he lived quietly, still occupied with agriculture and holding steadfastly to his republican convictions. Napoleon in a personal interview endeavored in vain to persuade him to take the post of senator. He also offered him the cross of the legion of honor, but Lafayette rejected it with disdain, calling it an absurdity. When the question was submitted to the people whether Napoleon should be first consul for life, Lafayette voted in the negative, and informed Napoleon of the fact in a letter, which put an end to their intercourse. Nothing could tempt him from his retirement. President Jefferson offered to appoint him governor of Louisiana, then just become a territory of the United States; but he was unwilling by quitting France to appear to abandon the cause of constitutional freedom on the continent of Europe. During the hundred days after the return from Elba, when Napoleon granted to the people an elective house of representatives, Lafayette again appeared in public. He was chosen a representative and took his seat in the chamber, refusing a peerage which the emperor offered him. On the first ballot for president of the house he had the highest number of votes; but he declined the honor, and exerted himself for the election of Lanjuinais. He took little part in the debates till after Napoleon's return from Waterloo, when he took the lead in demanding the emperor's abdication. Lucien, the brother of Napoleon, opposed the motion to this effect in a speech of great power and eloquence. He denounced the proposition as a signal instance of inconstancy and national ingratitude. Lafayette arose, and, contrary to rule and custom, spoke from his place and not from the tribune. "The assertion which has just been uttered," he said, "is a calumny. Who shall dare to accuse the French nation of inconstancy to the emperor Napoleon? That nation has followed his bloody footsteps through the sands of Egypt and through the snows of Russia; over fifty fields of battle; in disaster as faithfully as in victory; and it is for having thus devotedly followed him that we now mourn the blood of three millions of Frenchmen." These few words made an impression on the assembly which could not be resisted; and as Lafayette ended, Lucien himself bowed respectfully to him and without resuming his speech sat down.

After the entry of the allies into Paris, Lafayette returned to La Grange. Touched with a sympathy for Napoleon in his adversity which he had not felt at the height of his power, he offered to procure him the means of escaping to America; but Napoleon could not forgive his former opposition, and refused to accept his assistance. In 1818 Lafayette was elected to the chamber of deputies, where he voted constantly for all liberal measures, and opposed the censorship of the press and everything that tended to infringe the constitutional rights of the people.—In 1824 the congress of the United States passed unanimously a resolution requesting President Monroe to invite Lafayette to visit the United States. He accepted the invitation, but declined the offer of a ship of the line for his conveyance, and with his son and secretary took passage on a packet ship from Havre to New York, where he landed on Aug. 15, 1824. His progress through the country resembled a continuous triumphal procession. He visited in succession each of the 24 states and all the principal cities. In December congress voted him a grant of \$200,000 and a township of land, "in consideration of his important services and expenditures during the American revolution." His hereditary fortune had been mostly lost by confiscation during the reign of terror. On Sept. 7, 1825, he sailed from Washington in a frigate named in compliment to him the Brandywine. On his arrival at Havre the people assembled to make a demonstration in his honor, but were dispersed by the police. In August, 1827, he pronounced a funeral oration over the body of Manuel, a distinguished member of the chamber of deputies. In November of the same year the chamber was dissolved, and Lafayette was reelected. During the revolution of July, 1830, he was appointed commander-in-chief of the national guards of Paris, and, though not personally engaged in the fight, his name and his experience and energy were of the greatest service to the liberal cause. His influence was successfully exerted to prevent the revolution from assuming a sanguinary character, and from proceeding to extremes which would have brought France into perilous collision with all the powers of Europe. He sacrificed his own republican preferences for the sake of peace and order, and placed Louis Philippe on the throne, "a monarchy surrounded by republican institutions." He soon resigned his commission as commander of the national guards, and confined himself to his duties as a representative of the people, and to the exercise of his moral influence as the acknowledged chief of the constitutional party on the continent of Europe. In attending in the winter and on foot the obsequies of a colleague in the chamber of deputies, he contracted a cold which settled on his lungs and caused his death. He received a magnificent funeral, and his body was buried, by his own direction, in the cemetery of Pic-

pus in the faubourg St. Antoine.—See “Eulogy on Lafayette, delivered in Faneuil Hall, Sept. 6, 1834,” by Edward Everett; and *Mémoires et manuscrits de Lafayette*, published by his family (6 vols. 8vo, Paris, 1837-'8). There are numerous biographies of him, both in French and English.

**LAFAYETTE COLLEGE**, an institution of learning at Easton, Pa., chartered in 1826. Situated in the great mining and manufacturing region of Pennsylvania, the college has special facilities for affording a scientific and industrial education. Besides the usual classical course, there is a general course in science, and the following special courses of four years each: 1, engineering, civil, topographical, and mechanical; 2, mining engineering and metallurgy; 3, chemistry. The “working sections” afford opportunities for combining theoretical instruction with practical operations in road and mining engineering, metallurgy and mineralogy, and chemistry. Post-graduate courses are also provided. Of the several college buildings, the most imposing is Pardee hall, completed in 1873, for the use of the Pardee scientific department, through the munificence of Mr. Ario Pardee of Hazleton, Pa., whose gifts to the college amount to nearly \$500,000. It is constructed of Trenton brown stone, with trimmings of light Ohio sandstone, and consists of a central building five stories high, 53 ft. front and 86 ft. deep, and a wing on each side 61 by 31 ft., four stories high; the whole terminating in two cross wings 42 ft. front and 84 ft. deep, making the front of the entire structure 256 ft. In 1874 there were 280 students and 28 instructors, of whom 16 were professors and 3 assistant professors. The college has valuable collections and apparatus, and a library of 8,200 volumes.

**LA FÈRE**, a town of France, in the department of Aisne, at the confluence of the Serre and the Oise, 13 m. N. W. of Laon; pop. in 1866, 3,122. It is strongly fortified, and has a school and bureau of artillery, an arsenal, and fine barracks. It was bombarded for two days by the Germans in 1870, and capitulated on Nov. 27, after an unsuccessful sortie, with 2,000 soldiers and 70 pieces of artillery.

**LAFFITTE, Jacques**, a French banker, born in Bayonne, Oct. 24, 1767, died in Paris, May 26, 1844. He was the son of a poor carpenter, but received a fair education. In 1788 he went to Paris, was admitted a clerk in the banking house of Perregaux, and at the end of a few years was made a partner. He at once became the leading spirit of the firm, and successfully extended the range of its operations. He was chosen one of the regents of the bank of France in 1809, member of the tribunal of commerce in 1813, and governor of the bank in 1814, holding the last post for five years. During the events of the two restorations his liberality was equally conspicuous with his integrity. In 1814 he advanced 2,000,000 francs to the pro-

visional government to relieve its embarrassment and secure the pay of the French army. In 1815 he made himself responsible for 600,000 francs, exacted by Blücher as a war contribution from the city of Paris. Meanwhile he was banker of both Louis XVIII. and Napoleon, and faithfully discharged his confidential duties toward them. When the latter finally left the capital, he placed in trust with Laffitte about 5,000,000 francs, which was afterward distributed according to his will. In 1816 he was elected to the chamber of deputies; and although he took his seat among the opposition, he was appointed member of a government committee on finance, and was instrumental in persuading the king to resist the imprudent tendencies of his adherents. In 1817 he was reelected; and in 1818, when the public credit was in danger, he prevented a commercial crisis by purchasing government stocks to the amount of several millions. He participated in the establishment of institutions for bettering the condition of the common people, among others of the savings bank of Paris; he opened his purse to old officers in reduced circumstances, relieved merchants on the verge of bankruptcy, and readily assisted even his political opponents. His political importance was increasing daily; his house became the rendezvous of the most eminent members of the opposition, either in the legislative chambers or in the public press; he was the friend of Béranger and the patron of Thiers. He embraced with ardor the cause of Louis Philippe, and pointed him out beforehand as the only man who could save the country in the event of a revolution. On the publication of the famous ordinances of July, 1830, he first tried to bring back Charles X. to a wiser line of policy; but his efforts being fruitless, he moved the organization of a provisional government, issued a proclamation in behalf of the duke of Orleans, proposed his appointment as lieutenant general of the kingdom, and brought about a reconciliation between him and Lafayette, thus preventing the latter from proclaiming the republic; and finally he had the duke chosen king of the French by 219 deputies, out of 252 present (Aug. 7). He was appointed minister of state, and, assuming the ministry of finance, was intrusted with the premiership, Nov. 3; but his sentiments were too liberal to suit the king, and he resigned in the following March. His banking business had suffered from his absence and the commercial difficulties consequent upon the revolution, his credit became impaired, and his exertions to prevent the fall of his firm were unavailing. He sold his property, and established a new banking house under the appellation of *banque sociale*, of which he was the manager; but his anticipations of success were not realized. He was elected again to the chamber of deputies in 1837 by one of the districts of Paris, reelected in 1839 and 1842 by the city of Rouen, and at the opening of the session of 1843-'4

presided over the chamber as its oldest member. His only daughter married the eldest son of Marshal Ney. Besides some financial and political essays which have been printed, Laffitte left *mémoires* which are still unpublished. *Les souvenirs de M. Laffitte, racontés par lui-même* (3 vols., 1844), written by Ch. Marchal, deserves little credit. There is an elegant biographical sketch of him, by Loménie, in the *Galerie des contemporains illustres*.

**LAFITAU, Joseph François**, a French missionary, born at Bordeaux in 1670, died there, July 3, 1746. He entered the society of Jesus at an early age, and, after distinguishing himself by his taste for literature and historical pursuits, was sent as a missionary to Canada in 1712. He was placed at the Iroquois mission at Sault St. Louis, where his room is still shown. Here he devoted himself to the study of the Indian type and character. In 1716 he discovered and identified the ginseng, the Chinese estimation of which was known. He returned to France the next year, and issued a *Mémoire présenté à son altesse royale Mgr. le duc d'Orléans, régent de France, sur la précieuse plante du ging-seng de Tartarie, découverte en Amérique* (Paris, 1718; Montreal, 1858), which led to a trade in ginseng between America and China. His studies of Indian life compared with that of ancient nations appeared after a visit to Rome in *Mœurs des sauvages américains comparées aux mœurs des premiers temps* (2 vols. 4to, 1724). He also wrote *Histoire des découvertes des Portugais dans le nouveau monde* (2 vols. 4to, 1733).

**LAFITTE, Jean**, a corsair, privateer, or smuggler of Louisiana and the gulf of Mexico, born in France, either at St. Malo, Marseilles, or Bordeaux, about 1780, died, according to some accounts, at sea in 1817, according to others, at Silan, Yucatan, in 1826. There is a singular uncertainty with regard to the events of his career. It has been stated that he never was at sea but twice—once when he came to America, and again in the voyage on which he was drowned; and that he fitted out privateers to cruise against Spanish commerce under the flag of Cartagena. Other authorities assert that he began life as mate of a French East Indiaman, but, quarrelling with the captain, left his ship at Mauritius and entered upon a course of daring and successful piracy in the Indian ocean, varied by occasional ventures in the slave trade. After several years he returned to France, disposed of his prizes, sailed for the West Indies, and took out a commission as privateer from the newly organized government of Cartagena (afterward New Granada), continuing his depredations, not only upon Spanish, but upon British commerce. Another account represents him as having begun his career as lieutenant of a French privateer, which was captured by a British man-of-war and taken into an English port, where the officers and crew of the privateer were thrown into prison. Here Lafitte was confined for several years under circum-

stances of peculiar hardship, after all his comrades had obtained their release. The resentment toward Great Britain engendered by this real or supposed severity is said to have been the motive that inspired his subsequent career. Unable to gratify this resentment in the service of his native country, on account of the suspension of hostilities at the time of his release, he found means of doing so under cover of a privateer's commission (against Spain) obtained from the Cartagenian government. According to this account—which bears some indications of authenticity in its general features—the only acts of Lafitte that could properly be designated as piratical were committed against British vessels. He is said to have gone to New Orleans in 1807; and whatever may have been the facts with regard to his early history, there is no doubt that in 1813-'14 he was at the head of an organized and formidable band of desperadoes, whose headquarters were on the island of Grande Terre, in Barataria bay, some 30 or 40 miles west of the mouth of the Mississippi. It is generally admitted that the operations of these adventurers were not restricted within the limits to which their commission would have confined them. Barataria bay afforded a secure retreat for their fleet of small vessels; and their goods were smuggled into New Orleans by being conveyed in boats through an intricate labyrinth of lakes, bayous, and swamps, to a point near the Mississippi river a little above the city. After various ineffectual presentments and prosecutions before the civil tribunals, an expedition was despatched against the Baratarians in 1814, under the command of Commodore Patterson. The settlement on Grande Terre was captured, with all the vessels that happened to be in port at the time; but Lafitte and his comrades made their escape among the swamps and bayous of the interior, from which they returned to the same rendezvous and resumed operations, as soon as Com. Patterson's forces had retired. About the same time the British, then maturing their plans for a descent upon the southern coast of the United States, made overtures to Lafitte for the purpose of securing his coöperation in that enterprise. A brig of war was despatched to Barataria, her commander bearing a letter from Commodore Percy, commanding the British naval forces in the gulf, and one from Col. Nichols, then in command of the land forces on the coast of Florida, offering Lafitte \$30,000 and the command of a fine ship, on condition of obtaining his services in conducting the contemplated expedition to New Orleans and in distributing a certain proclamation to the inhabitants of Louisiana. Lafitte dissembled with the British officer (Capt. Lockyer, of the *Sophia*) who was the bearer of these tempting proposals, and asked for time to consider them. Meantime he immediately wrote to Gov. Claiborne of Louisiana, enclosing the documents that had been handed him by Capt. Lockyer, informing the

governor of the impending invasion, pointing out the importance of the position that he occupied, and offering his services in defence of Louisiana, on the sole condition of pardon to himself and followers for the offences with which they stood charged. This amnesty would, of course, include in its provisions a brother of Jean Lafitte, who was then in prison in New Orleans under an indictment for piracy. After some hesitation on the part of the American authorities, Lafitte's offer was accepted. In connection with an officer of the army Lafitte was employed in fortifying the passes of Barataria bay, and rendered efficient service, in command of a party of his followers, in the battle of Jan. 8, 1815. The subsequent career of Lafitte is involved in as much obscurity as his earlier life. President Madison confirmed the amnesty which had been granted to all the Baratarians who had enlisted in the American service, though it does not appear that their chief ever received any further reward from the government. It is generally understood that he returned to his old pursuits and formed a settlement on the site of the present city of Galveston, which was broken up in 1821 by a naval force under the orders of Lieut. (afterward Commodore) Kearny; but it is possible that his brother Pierre, who commanded one of his vessels, has been confounded with him. Other authorities say that he was for a time after the war commander of a packet between Philadelphia and New Orleans. In person Lafitte is represented to have been well formed and handsome, about 6 ft. 2 in. high, with large hazel eyes and black hair. His manners were polished and easy, though retiring; his address was winning and affable; and his influence over his followers almost absolute. There is every reason for believing that he was of a respectable family, and that his early opportunities for education had been good.—See "De Bow's Review," vols. xi., xii., xiii., xix., and xxiii.; Marbois's "Louisiana;" Gayarré's "Louisiana;" Latour's "War in Louisiana;" Walker's "Jackson and New Orleans;" Yoakum's "History of Texas;" and Parton's "Life of Jackson."

**LA FLÈCHE**, a town of France, in the department of Sarthe, on the left bank of the Loir, in a beautiful valley, 25 m. S. W. of Le Mans; pop. in 1866, 9,292. It has a tribunal of primary jurisdiction, a chamber of agriculture, a theatre, an aqueduct, and a statue of Henry IV. which was unveiled in 1857. The large castle built by Henry IV., which is surrounded by a magnificent park and contains a picture gallery and a library of about 20,000 volumes, now serves as a military school. The town has an active trade in grain, wine, leather, cattle, and fowls. In December, 1793, the royalists were defeated here by the republican troops under Westermann. The Jesuit college of La Flèche was long celebrated, and among its students were some very eminent men. The town suffered much during the war of La Vendée.

**LAFONT, Pierre Chéri**, a French actor, born in Bordeaux in 1801, died in Paris, April 19, 1873. He began life as a surgeon in the navy, went to Paris in 1822, and made his début at the Vaudeville in 1823. From 1839 to 1849 he achieved brilliant successes at the Variétés as the chevalier de St. Georges and in other plays. In 1855 he resumed his connection with the Vaudeville, and in 1859 appeared at the Gymnase, when his personation of the marquis in *Les Ganaches* (1862) and of Raoul in *Montjoye* (1863) increased his reputation. His more recent successes were won in *Kabagas* and *Le centenaire*. He was a comic actor of singular elegance and grace, and was as popular in London as in Paris.

**LA FONTAINE, Jean de**, a French fabulist, born in Château-Thierry, July 8, 1621, died in Paris, April 13, 1695. He received an irregular education, partly at home, partly at the college of Rheims, and in 1641 entered the seminary of the Oratorians with the design of becoming a priest; but at the end of 18 months he returned home, and led an idle and dissipated life, which gave little promise of his future celebrity. He showed however considerable poetical talent, and this was fully awakened on his hearing the recitation of one of Malherbe's odes. He began eagerly to read the ancient and modern poets and prose writers. In order to reclaim him from his loose habits and apparent idleness, his father induced him to marry in 1647, and resigned to him his own office of master of waters and forests; but Jean was ill fitted for either a husband or a functionary, and was equally neglectful of his matrimonial and official duties. In 1654 he published at Rheims a translation in verse, or rather an adaptation, of Terence's "Eunuch," which gave no indication of his future powers. He soon went to Paris, and was introduced to Fouquet, the great patron of literature and art at that time, who appointed him his poet, and bestowed upon him a yearly income of 1,000 livres. La Fontaine was thus enabled to live at his ease for seven years, during which he produced only occasional poems of no great merit. On the fall of his protector he wrote in 1661 his admirable *Élégie aux nymphes de Vaux*, an eloquent but fruitless appeal to the magnanimity of Louis XIV. in behalf of the superintendent. Two years later he renewed his entreaties in his *Ode au roi*, but with no better success. He would now have been at a loss for means of livelihood, had it not been for the generosity of two noble ladies, the duchess of Bouillon, Cardinal Mazarin's youngest niece, who welcomed him at her château, and the duchess dowager of Orleans, from whom he received a pension as her gentleman servant; but he was always neglected by the king, who could not overlook his irregular mode of life, the character of some of his writings, and above all his fidelity to Fouquet. In 1665 he brought out the first series of his *Contes*; a second part appeared in 1666, and they were completed in 1671.

and 1675. Notwithstanding their licentious turn, they were eagerly read even by the most respectable ladies. Meanwhile he had already published part of the work upon which his fame especially rests; the first six books of his *Fables* had appeared in 1668 with a dedication to the dauphin, the son of Louis XIV. and pupil of Bossuet. The following five books were published in 1678 and 1679, with a dedicatory epistle to Mme. de Montespan; the 12th and last, written under encouragement from the young duke of Burgundy, grandson of the king, through his preceptor Fénelon, was printed 15 years later, when the poet had reached the age of 73. His life had undergone several changes during that period of increasing fame; the death of the duchess of Orleans and the exile of the duchess of Bouillon left him unprovided for, but he received the most generous hospitality from Mme. de la Sablière, a lady celebrated for her literary taste, who for 20 years secured him all the comforts of a home. When she died, he was fortunate enough to find at M. d'Hervart's another home, where he was cared for with equal kindness, and where he died. During the last two years of his life the religious sentiments of his youth revived; he performed severe penances for such of his works as strict morality could not approve of, and it may be said that his end was the sage's death as depicted by himself: *Rien ne trouble sa fin; c'est le soir d'un beau jour*. He had been elected to the French academy in 1683, but was not admitted till 1684 in conjunction with Boileau the satirist. His character presented a strange mixture of childish simplicity and finesse, which is perceptible in his poems. His freedom from all restraint and his dreamy disposition have given birth to innumerable anecdotes of his absence of mind. Besides the works mentioned above, he left *Psyché*, a mythological novel, and *Adonis*, a charming narrative poem, both of which were published in 1669 under the patronage of the duchess of Bouillon; *Phlémon et Baucis* and *Les filles de Minée*, which, although intended as mere imitations of Ovid, are stamped with true originality; four or five light comedies, and two operas. There are several recent editions of La Fontaine's complete works; and his select works, his fables in particular, are constantly reprinted in every form. Many translations into English have been made, including the "Fables" in verse by Robert Thompson (4 vols. 8vo, Paris, 1806), and by Elizur Wright (French and English, illustrated, 2 vols. 8vo, Boston, 1841; 2 vols. in 1, 12mo, 1856). There is an excellent *Histoire de la vie et des ouvrages de La Fontaine*, by Walckenaer (4th ed., Paris, 1858).

**LA FORGE, Anatole de**, a French author, born in Paris, April 1, 1821. He was for several years in the diplomatic service, and from 1848 to 1863 was a prominent editor of *Le Siècle* and a warm advocate of the independence of Italy and Poland. In September, 1870, the government of the national defence appointed

him prefect of the department of Aisne; and although the Germans had invaded the greater part of that department, he successfully defended Saint Quentin (Oct. 8), where he was wounded, and afterward resigned because he was not allowed to resist a new attack against that town. He joined Gambetta at Tours, and for a short time at the beginning of 1871 he was prefect of Basses-Alpes. He has published a great variety of writings, including *Histoire de la république de Venise sous Manin* (2 vols., Paris, 1850), and *Des vicissitudes politiques de l'Italie dans ses rapports avec la France* (2 vols., 1850); and he is now engaged (1874) in finishing his *Histoire du cardinal Richelieu*.

**LA FOURCHE**, a S. E. parish of Louisiana, bordering on Baratavia bay and intersected by Bayou La Fourche; area, 1,100 sq. m.; pop. in 1870, 17,719, of whom 6,659 were colored. The surface is level, and the soil, except where too marshy for cultivation, is very fertile. Morgan's Louisiana and Texas railroad passes through the parish. The chief productions in 1870 were 181,095 bushels of Indian corn, 11,624 of sweet potatoes, 1,691,410 lbs. of rice, 7,128 hogsheads of sugar, and 366,685 gallons of molasses. There were 334 horses, 1,812 mules and asses, 1,241 cattle, and 521 swine; 1 iron foundry, 1 saw mill, and 69 manufactories of molasses and sugar. Capital, Thibodeaux.

**LA FUENTE**, or **Lafuente, Modesto**, a Spanish historian, born in 1806. He was for some time professor at Astorga, and became known at Leon and subsequently in Madrid as a satirical journalist. His periodical writings, chiefly published under the name of Fray Gerundio (1844-'50), acquired great popularity; his principal work is a *Historia general de España* (26 vols., Madrid, 1850-'62).

**LA FUENTE Y ALCÁNTARA, Mignel**, a Spanish historian, born in the province of Malaga, July 10, 1817, died in Havana in August, 1850. He studied law, devoted himself to historical investigations, became secretary of the cortes, and was appointed attorney general (*fiscal*) in the island of Cuba. He had barely arrived in Havana when he was attacked by the local fever and died. His vast researches into the history of his country, and his appreciation of its different political phases as well as its romance, are exhibited in his *Historia de Granada* (4 vols., Granada, 1848-'8; 2 vols., Paris, 1851). He also wrote a work on hunting, and one on the characters and revolutions of the different races in Spain at different periods, and especially of the Moors during the middle ages.

**LAGO MAGGIORE** (anc. *Lacus Verbanus*), a lake of N. Italy and Switzerland, enclosed by Lombardy, Piedmont, and the canton of Ticino; length 40 m.; average breadth 2 m., greatest breadth 5 m.; greatest depth 2,625 ft.; elevation of surface above the sea, about 683 ft. The principal affluents are the Ticino, flowing from the St. Gothard range, the Toce or Toccia, entering on the west, and the Tresa,

which drains the lake of Lugano; its great outlet is the Ticino, which issues from its S. extremity at the town of Sesto. Near the entrance of the gulf of Tosa, on the W. side, lie the Borromean islands, remarkable for their picturesque beauty. The Swiss portion of this lake is termed lake of Locarno. The surrounding mountains are covered with forests, the timber of which gives rise to a considerable traffic, and employs numerous vessels. Steamers ply regularly between Magadino, near the N. extremity, and Sesto. The lake abounds in fish, particularly trout. There are valuable quarries of fine white marble on its shores.

**LAGOMYS.** See PIKA.

**LAGOS**, a seaport town of Portugal, in the province of Algarve, 110 m. S. S. E. of Lisbon, on the N. W. shore of Lagos bay; pop. about 8,000. It is well built, and contains three churches, three convents, a civil and military hospital, an almshouse, a grammar school, and a handsome aqueduct. Its inhabitants are chiefly engaged in the tunny and sardine fishery. The harbor, which is only navigable for small vessels, is defended by four forts. In the bay of Lagos, Aug. 17, 1759, a British fleet under Boscawen obtained a decisive victory over a French squadron under De la Clue.

**LAGOS**, a British settlement on the coast of Dahomey, W. Africa, comprising the island of Lagos, called Eko by the natives, and the coast from the river Yerewa, near Badagry, to Ode, about lon. 4° 10' E.; pop. in 1871, 60,221, of whom only 92 were whites. Within these bounds are the fortified trading posts of Badagry, Lagos, Palma, and Leckie, and a few native villages. The station at Ode is now abandoned. A strip of country back of these forts, from 5 to 12 m. wide, is considered to be under the protection of Great Britain. The coast is low and sandy, with outlying bars and lagoons inland. The island of Lagos is at the mouth of Ikorodu lagoon, which opens into the sea through a narrow channel. Large vessels do not pass in, but land their cargoes on the outer beach, whence they are carried by canoes to the inner lagoon. A narrow arm of this lagoon stretches westward parallel to the coast about 60 m. to Denham lagoon. Badagry is on the inner side of this strait. Palma and Leckie are on the outer coast, 70 or 80 m. further E. The chief rivers which empty into the lagoon are the Yerewa, the Ogun or Lagos, and the Ona. The trade at these settlements was once flourishing, and previous to the troubles on the Gold coast the revenue amounted to £45,000. The principal exports are palm oil and kernels, shea butter, ground nuts, cotton, and indigo. In 1872 the value of the imports was £366,256; exports, £444,848. The revenue for the same year was £41,346; expenditure, £41,346; public debt, £18,628.—The town of Lagos had in 1871 a population of 36,005, of whom 82 were white. The church (of England) missionary society, the Wesleyan society, and the Roman Catholics

have churches and schools there. The hospital, built originally as a barrack for troops, is the principal public building. Lagos was formerly the capital of a small territory tributary to Dahomey. It was one of the chief slave-trading stations on the coast, and was strongly fortified. In November, 1851, a British consul was fired on while negotiating a treaty for the abolition of the slave trade, and a small force from the steamer Bloodhound, which attempted to avenge the insult, was driven off. In December following an organized attack was made, and it was captured, although defended by 5,000 men and more than 50 guns. It was formally ceded to Great Britain in 1861.

**LAGOSTOMUS**, a genus of mammals of the chinchilla family, inhabiting the vast plains east of the Andes. There is but one species, *L. trichodactylus*, the viscacha or biscacho. The anterior feet are four-toed, with small falcular nails for digging; the posterior three-toed, with strong

Lagostomus (*L. trichodactylus*).

straight nails; ears and tail moderate. They dwell in burrows, which are near the surface, and so numerous that in many places it is dangerous to ride rapidly over the plains or pampas inhabited by them. Like the prairie dog of North America, this animal has companion burrowing owls, which sit at the mouth of the holes during the daytime; as in the case of the American rodent, it is not likely that the owl lives in the same hole, but it makes use of these burrows which it finds ready dug, driving out the viscacha, and perhaps occasionally making a meal on the unprotected young; from the absence of shrubs and trees on the great prairies and pampas, the owls, unable to burrow themselves, occupy the holes of the rodents as habitations and breeding places.

**LAGOTIS** (Bennett), or *Lagidium*, a genus of the chinchilla family, having the following dental formula: incisors  $\frac{3}{3}$ ; molars  $\frac{4-4}{4-4}$  = 20. The incisors are sharpened, and each molar con-

sists of three complete oblique plates. Skull arched posteriorly and above; the superior cellules of the tympanum are inconspicuous. All the feet are four-toed, the great toe being entirely absent; nails long and subfalcular; ears very long; tail long; fur soft but caducous. Of this genus there are two species, the *L. Cuvieri* and the *L. pallipes*, being, it is supposed, the viscacha of all the writers from Pedro de Cieça downward, who have declared that animal to be an inhabitant of the western or Peruvian slope of the Andes. It is about the size and color of the hare, which is wanting to the fauna of Peru, Chili, and Ecuador, and appears to be equivalent in those countries to that creature and to the rabbit, among which it has been classed by some writers, especially Lesson, in his *Manuel*, who has apparently confounded the eastern and western species, *lagotis* and *lagostomus*, and who gives it as the *lepus viscaccia* of Gmelin. This

Lagotis Cuvieri.

animal breeds among rocks and stony places, burrows in the ground, and is famous, if mortally wounded and not killed at once, for taking refuge in its burrow and dying within it, so as to be lost to its pursuers. Its fur, which is longer and softer than that of the rabbit, has the peculiarity of falling out as soon as the animal is dead. This animal and the chinchilla are evidently connecting links between the hares and the squirrels, the first coming nearer to the hares, the latter to the squirrels.

**LA GRANGE**, a N. E. county of Indiana, bordering on Michigan, and drained by Pigeon river; area, 384 sq. m.; pop. in 1870, 14,148. It has a nearly level surface, much of which is occupied by timber. The soil is fertile. The Grand Rapids and Indiana railroad passes through the county. The chief productions in 1870 were 445,731 bushels of wheat, 344,882 of Indian corn, 58,488 of oats, 119,563 of potatoes, 120,461 lbs. of wool, 243,649 of butter,

and 18,139 tons of hay. There were 5,217 horses, 4,211 milch cows, 5,072 other cattle, 31,958 sheep, and 12,004 swine; 4 manufactories of carriages, 1 of woollen goods, 6 flour mills, 17 saw mills, and 3 currying establishments. Capital, La Grange.

**LAGRANGE, Joseph Louis**, count de, a French geometrician, born in Turin, of French parents, Jan. 25, 1736, died in Paris, April 10, 1813. His first publication was a letter to C. J. Fagnano, June 23, 1754, which contained a series of fluxions and fluents of different orders, somewhat resembling the binomial theorem of Newton. In 1755 he was made professor of geometry in the royal school of artillery at Turin, where many of his pupils were his seniors. In conjunction with several of them, he established a scientific society, whose memoirs, owing particularly to his contributions, afterward acquired a high reputation, his essays on the propagation of sound being especially noticed. He meanwhile corresponded with Euler, to whom he communicated his first ideas of the solution of the isoperimetrical problems. In 1764 he won a prize from the French academy of sciences for a memoir on the libration of the moon. In 1766 a second prize, on the subject of the satellites of Jupiter, was awarded him by the French academy; and he was invited to become a mathematical director of the Prussian academy. In Berlin he was treated with great distinction by Frederick the Great, and spent there 20 years, during which he prepared his great work, the *Mécanique analytique*. On the death of Frederick, yielding to a secret desire and to the entreaties of Mirabeau, notwithstanding liberal offers from the courts of Naples, Sardinia, and Tuscany, he went to France, where he was welcomed by Queen Marie Antoinette, received as a veteran pensioner of the academy an income equal to that which he had enjoyed at Berlin, and was provided with apartments in the Louvre. His *Mécanique analytique* appeared a few months after his arrival in Paris in 1787, and commanded general admiration. Though now in the zenith of his fame, he was seized with fits of morbid melancholy, during which he lost all taste for his wonted pursuits. His spirits revived about the beginning of the revolution, and his treatment by the revolutionists was perhaps still more flattering than that which he had obtained from kings and princes. His pension was unanimously confirmed by the national assembly, and he was appointed member of a committee for examining useful inventions, and director of the mint in conjunction with Monge and Berthollet. In 1793, when a decree of the convention ordered all persons not born in France to leave the country, an exception was made in favor of Lagrange. On the establishment of the normal school and of the polytechnic school he was appointed professor in those institutions. For his pupils he wrote his *Théorie des fonctions analytiques* (4to, 1797; new ed., 1813), and his *Leçons sur*

*le calcul des fonctions* (last ed., 1806); but the ideas in these books are far from being as perfect as the method of fluxions and its kindred doctrines. On the foundation of the institute and the board of longitude, he was placed among the members of the former, and at the head of the latter. On the entrance of the French army into Turin, the generals and many high functionaries, headed by the civil commissary, went in procession, by order of the directory, to congratulate Lagrange's father, then 90 years of age, on the merits of his son. Napoleon made him a senator and a count of the empire, and styled him the "high pyramid of mathematical sciences." His last years were devoted to preparing new editions of his *Mécanique analytique* (2 vols. 4to, 1811-'15), and *Théorie des fonctions analytiques* (4to, 1813). An edition of his complete works was published in 1867-'70, at the cost of the government.

**LA GRANJA**, or **San Ildefonso**, a small town of Spain, in the province of Segovia, 34 m. N. N. W. of Madrid, renowned for its romantic situation on the N. declivity of the Sierra Guadarrama, and for a fine palace built by Philip V. (1724-'7) at an elevation of nearly 4,000 ft., with pleasure grounds, in imitation of Versailles. One of the fountains (*f fuente de la fama*) rises 150 ft. The royal family resided here in summer, and here Maria Christina was surprised in the night of Aug. 13, 1836, by a number of *exaltados*, who had bribed her guards, and who obliged her to agree to restore the constitution of 1812, whence the name of "revolution of La Granja." Philip V. and his queen are buried in the church of the town. A manufactory after the model of Sèvres has been established here, but with little success. In the vicinity are various villas and parks which belong to the royal family.

**LA GUAYRA**, or **Laguaira**, a seaport of Venezuela, on the Caribbean sea, 5 m. N. E. of Carácas, of which it is the port; lat. 10° 36' N., lon. 66° 57' W.; pop. about 6,000. It comprises only two streets running E. and W., and occupies a narrow strip of land between the mountains and the sea; the houses are well built, and there are one or two good public edifices. The port is a deep bay with several creeks, the principal of which is that of Macuto to the east. The bottom is regular, and there is 15 ft. of water at a cable's length from the shore; but there being no shelter against the prevailing easterly winds, the anchorage is unsafe, and landing is often attended with great danger. Although La Guayra is the most extensively frequented port on the coast, ships after discharging their cargo commonly go to Puerto Cabello in search of safer anchorage and for repairs. The fort of Cerro Colorado commands the town; and the coast is lined at intervals with numerous batteries, most of which are, however, without armament. The principal commercial houses are branches of establishments in Carácas. The shipping averages about 200 vessels annually,

with an aggregate of 40,000 tons. The chief articles of export are coffee, cacao, indigo, hides, and sarsaparilla; the imports include machinery, manufactured goods, flour, and wine; and the total annual value of both exports and imports is estimated at \$8,000,000. There is besides an extensive coasting trade in the various productions of the country for Carácas, with which communication is carried on by a carriage road 12 m. long. The climate is healthy, although the heat, the greatest on the Caribbean shores, except that of Maracaibo, is excessive, ranging from 100° to 110° F.

**LA HARPE**, **Frédéric César**, a Swiss statesman, born at Rolle in 1754, died in Lausanne, March 30, 1838. He was educated in democratic opinions, and began the practice of law, but, disliking the profession, was on the eve of going to the United States to enlist in the continental army, when he became preceptor of a young Russian nobleman, whom he accompanied to Italy. His success attracted the attention of the empress Catharine II., who called him to St. Petersburg, confided to his care her two grandsons, Alexander and Constantine, and gave him the grade of colonel. The republican preceptor subjected the young princes to severe training, and taught them principles and ideas which seldom find their way into courts. On the breaking out of the French revolution, he actively participated by his writings in the plans for reorganizing the Helvetic confederation so as to make it a single and undivided republic. The government at Bern having made this known to the empress, she dismissed him, with a pension for life. Leaving Russia in 1793, he went to Geneva, and then to Paris, where he secured the intervention of the directory, thus accomplishing the revolution of 1798 by which Switzerland was to become a democratic republic. He became the controlling member of the Helvetic executive directory, and wielded with energy, and even violence, the power he had acquired through foreign arms; but his hopes were dispelled by the change in French policy after the 18th Brumaire. The Helvetic directory was dissolved, and La Harpe, suspected of conspiring against the new order of things, was arrested; but he escaped to Paris, and was told by Bonaparte that he had better leave Switzerland alone. He then retired to Plessis-Piquet, near Paris, where he devoted himself to agricultural pursuits, until the fall of the empire revived his hopes of his country's emancipation. In 1814 he received a visit from the emperor Alexander, who gave him the rank of general in the Russian army and bestowed upon him many distinguished favors. La Harpe resumed his influence over the mind of his former pupil; and if he could not prevail upon him to favor his democratic plans in regard to Switzerland, he at least contributed to the preservation of that confederation, and to the liberation of his own canton of Vaud from the rule of Bern. After the treaty of Vienna he resided in Lausanne. He published a num-

ber of pamphlets expounding his plans for the reorganization of his country, and denouncing the misdeeds of its old governments.

**LA HARPE, Jean François de**, a French critic, born in Paris, Nov. 20, 1739, died there, Feb. 11, 1803. His father died when he was nine years old, and he was admitted as a free scholar to the Harcourt college, where he gave early evidence of literary talent. On leaving this institution, he wrote with several of his comrades some satirical verses on certain members of the college, for which he was imprisoned by the police for several months. This severe punishment, together with his narrow circumstances, increased the natural bitterness of his disposition. His first attempts at poetry were heroic epistles, a kind of poem then much in vogue. In 1768 he produced his tragedy of *Warwick*, which was successful. Three similar plays, *Timoléon* (1764), *Pharamond* (1765), and *Gustave Wasa* (1766), failed; and, disappointed in his anticipations of fortune, he went to Ferney, where he remained for nearly two years the guest of Voltaire. On his return to Paris in 1768, he became a contributor to the *Mercure de France*, and was noted for the bitterness of his criticism. He won 11 of the academical prizes within 10 years, 8 being at the French academy. These successes, as well as the reputation which he won by his *Mélanie, ou la Religieuse*, a play flattering the liberal ideas of the time, procured in 1776 his election to the academy. The tragedies he produced after this were mercilessly criticised, and, with the exception of *Philoctète* (1780) and *Coriolan* (1784), were coldly received by the public. He was meanwhile the correspondent of the grand duke Paul of Russia, the son of Catharine II., and undertook several publications, especially an *Abrégé de l'histoire générale des voyages*, from which he realized some profit. He adopted the revolutionary principles, showed himself an ardent Jacobin, and became an occasional flatterer of Robespierre. Yet he was incarcerated during the reign of terror, which made such an impression on his mind that he became a devout Christian and an uncompromising enemy of all that was called philosophy. On his liberation after the 9th Thermidor, he resumed with great success a course of public lectures which he had begun a few years before. These lectures, collected under the title of *Lycée, ou Cours de littérature ancienne et moderne* (12 vols. 8vo, 1799-1805), were long regarded as a standard of literary criticism. His *Correspondance littéraire* with the grand duke Paul was printed in 1801 (4 vols. 8vo); and the severity of its judgments rekindled the hatred against him, and embittered the last years of his life.

**LA HOGUE.** See CAPE LA HAGUE.

**LA HONTAN, Armand Louis de Delondarce de**, baron de la Hontan et Herlèche, a French traveller, born near Mont de Marsan, Gascony, about 1667, died in Hanover in 1715. His travels, which were widely read in French and

translated into English and other languages, make him play an important part in Canadian affairs, but he evidently came out merely as a private soldier. The voluminous Canadian documents are utterly silent as to him and his services. He came over in 1683 in one of the three companies of marines sent to enable Gov. de la Barre to invade the Iroquois cantons. He was in that governor's fruitless expedition, and in Denonville's against the Senecas. In 1688 he was sent to Michilimackinac and Sault Ste. Marie with a detachment, and pretended to have discovered and explored Long river, a branch of the Mississippi, which he peopled with fictitious tribes, misleading geographers for many years. He soon after descended to Quebec, and in November, 1690, sailed for France. He was sent back to Canada in 1691, and while he was returning to France soon after with despatches from Frontenac, the vessel put in to Placentia, Newfoundland, and La Hontan rendered signal service in defending it against the English. He was accordingly made king's lieutenant in Newfoundland and Acadia, with a company of 100 men. On arriving there in 1693 he got into difficulties with Gov. de Brouillon, and made his escape to Portugal. He then visited Spain, Denmark, and England. After vainly soliciting redress and advancement from the French court, he published his *Nouveaux voyages de M. le baron de Lahontan dans l'Amérique Septentrionale* (2 vols. 12mo, the Hague, 1703; the second volume relating chiefly to the Indians). A third volume, *Dialogue de M. le baron de Lahontan et d'un sauvage dans l'Amérique, avec les voyages du même en Portugal*, appeared at Amsterdam in 1704. The dialogue is fictitious and merely a vehicle for anti-Christian ideas. The voyages are dedicated to the king of Denmark, and are said to have been rewritten by Gueudeville. La Hontan also wrote *Réponse à la lettre d'un particulier opposée au manifeste de S. M. le roi de la Grande Bretagne contre la Suède*, published by Leibnitz after the baron's death. Truth and fiction are so blended in his work that it has long ceased to be of any authority.

**LAHORE**, a city of India, capital of the Punjab, about 1 m. from the E. bank of the Ravee, in lat. 31° 36' N., lon. 74° 21' E., 265 m. N. W. of Delhi; pop. in 1871, 98,924. It is walled with brick and defended by a citadel and outworks. The moat which formerly encircled it is now filled up, and is laid out in gardens and planted with trees. There are several fine mosques, including one of red sandstone, with lofty minarets and cupolas, said to have been built by Aurungzebe. The Hindoos have a number of temples, and in the neighborhood are some handsome tombs, one of the most attractive of which is that of the emperor Jehanghir, built of red sandstone and adorned with marble mosaics representing flowers and texts of the Koran. The city has narrow streets, tall gloomy houses, small but well furnished bazaars, and a vernacular college sup-

ported partly by the British government, having several hundred pupils. Lahore has little commercial activity, but has some manufactures, chiefly lacquered wares, mirrors, and silks, especially shawls, flowered with gold and silver threads. The surrounding country is

government to stop the slave trade, opened negotiations with the king of the Foolaahs at Timbo, the capital of Foota Jallon, and contributed much to the knowledge of that country and of the upper course of the Niger. The war with the Ashantees, in which Governor McCarthy

Tomb of Runjeet Singh, Lahore.

covered with vast ruins, attesting the magnificence of the ancient city, which was the capital of the Ghuznevite dynasty in the 12th century, and the favorite residence of the descendants of Baber. It is said to have been founded by Lava or Lo, the son of Rama, whose wife Leeta is still worshipped here. Runjeet Singh was invested with the rajahship of Lahore by Zeman Shah in 1799, and after his death the territory was seized by the British (1849) and consolidated with the rest of the Punjab.

**LAHR**, a town of Germany, in Baden, on the Schutter, 24 m. N. of Freiburg; pop. in 1871, 7,710. It has a gymnasium, a Protestant and a Catholic church, a female high school, an industrial and a commercial school, and manufactories of tobacco, leather, vinegar, and snuff-boxes. A branch line connects the town with the Baden railway. Since 1800 the most popular almanac of Germany, *Der Lahrer Hunkende Bote*, has been published here; it reached in 1873 a circulation of over 800,000, more than 50,000 being among the Germans of America.

**LAIBACH**. See LAYBACH.

**LAINZ**. See LAYNEZ.

**LAING, Alexander Gordon**, a British traveller, born in Edinburgh, Dec. 27, 1794, murdered near Timbuctoo, Africa, in September, 1826. He was educated for a schoolmaster, but joined the army, went to the West Indies in 1811, and served there several years in various positions, a part of the time with his uncle, afterward Lieut. Gen. Gordon. In 1820 he went to Sierra Leone, and became aide-de-camp to the governor, Sir Charles McCarthy. He took an active part in the efforts made by the English

lost his life, compelled him to return to Sierra Leone. On returning to England he was made major, and placed at the head of an African exploring expedition. He sailed for Tripoli in 1825, and on July 26, 1826, joined a caravan for Timbuctoo, which he reached on Aug. 18. He left there on Sept. 22 for Sego, where he expected to arrive in 15 days, but was killed on the journey by the Arabs of the country, acting under instructions, it was afterward discovered, of the son of the prime minister of the bashaw of Tripoli. He published an account of his first journey under the title of "Travels through the Timanee, Kooranko, and Soolima Countries, to the Sources of the Rokelle and Niger, in the year 1822" (8vo, London, 1825).

**LAING, Malcolm**, a Scottish historian, born on the island of Mainland, Orkneys, in 1762, died there in November, 1818. He was educated at the university of Edinburgh, studied law, and was called to the bar in 1785; but not succeeding in his profession, he turned his attention to literature. His first work was a continuation of Dr. Henry's "History of Great Britain," which was followed in 1800 by a "History of Scotland, from the Union of the Crowns to the Union of the Kingdoms." To this were appended two dissertations, historical and critical, one on the Gowry conspiracy, the other on the authenticity of Ossian's poems. His arguments against the latter brought considerable obloquy upon him at the time, but led to the investigation and report of the Highland society. To the second edition of his history (1804) he appended an essay "On the Participation of Mary, Queen of Scots, in the Murder of Darnley," in which he strongly argued her guilt. In 1807 he was a member of parliament for the Orkneys, but ill health soon compelled him to withdraw to private life. Besides the works already mentioned, he published an edition of the "History and Life of King James VI.," from the original manuscript, which had served as the foundation of the forgeries of Crawford in his "Memoirs of the Affairs of Scotland."—His brother, SAMUEL LAING, is known as the author of books of travel, and of works on so-

count of his first journey under the title of "Travels through the Timanee, Kooranko, and Soolima Countries, to the Sources of the Rokelle and Niger, in the year 1822" (8vo, London, 1825).

cial and political subjects. A new edition of his book on Norway appeared in 1854.

**LAIRESSE, Gérard de**, a Flemish painter, born in Liège in 1640, died in Amsterdam, July 28, 1711. At the age of 16 he was a successful painter, and received large prices for his pictures; but dissipation kept him in poverty until he removed to Amsterdam, where he rose to fortune and reputation. At the age of 50 he became blind, but he dictated his discourses on the theory and practice of painting, which were published under the title of *Groot schilderboek* (Amsterdam, 1707). He excelled in subjects drawn from mythology, particularly bacchanalian scenes.

**LAIÏS**, the name of two celebrated courtesans of ancient Greece. **I.** The elder Laïs lived in the time of the Peloponnesian war, and is generally supposed to have been a native of Corinth. She was considered the most beautiful woman of her age, but was also remarkable for her avarice and caprice. Among her lovers was the philosopher Aristippus, who dedicated two of his works to her. She grew enamored of Eubotas of Cyrene, who promised to take her to his native city if he should prove victor in the Olympic games. He succeeded, and fulfilled his promise by taking thither her portrait. In her old age she became intemperate, and died at Corinth, where a monument was erected to her memory in the grove called the Cranion. **II.** The younger Laïs was a native of Hyccara in Sicily, and lived in the age of Philip and Alexander the Great. She removed to Athens in her youth, and is said to have been induced by the painter Apelles to adopt the profession of a courtesan. She became the rival of the famous Athenian hetæra Phryne; but falling in love with a handsome Thessalian youth named Hippolocus, she accompanied him to his native country, where her beauty exciting the jealousy and envy of some of her sex, they allured her into a temple of Venus, and there stoned her to death. She was buried on the banks of the Peneus; the inscription engraven on her monument is given by Athenæus.

**LAKE** (It. *lacca*), a pigment prepared from infusions of vegetable dyes or of cochineal, by causing the coloring matter to unite and form a precipitate with some earthy or metallic oxide. This is usually alumina, but the oxides of tin and zinc sometimes serve as the basis. A solution of alum is employed to furnish the alumina, and potash is commonly added to it—always if the infusions are acid. If the infusions are made with alkaline liquors, the alum solution may be added alone. A decoction of turmeric yields an orange lake; of cochineal, a brilliant red lake (see **CARMINE**); of Brazil wood, also a red, made violet by excess of potash, and brownish by cream of tartar. Madder also gives a red lake. Persian or French berries produce yellow lakes; and green lakes may be obtained from these mixed with blue pigments. The varieties of blue pigments in use render it needless to prepare blue lakes.

**LAKE**, the name of nine counties in the United States. **I.** The N. W. county of Tennessee, bounded N. by Kentucky, W. by the Mississippi river, which separates it from Missouri, and S. E. by Redfoot river; area, about 250 sq. m.; pop. in 1870, 2,428, of whom 393 were colored. The surface is level, and the soil fertile. The chief productions in 1870 were 414,570 bushels of Indian corn and 52 bales of cotton. There were 511 horses, 615 milch cows, 1,304 other cattle, 816 sheep, and 5,853 swine. Capital, Tiptonville. **II.** A N. E. county of Ohio, bordering on Lake Erie and drained by Grand and Chagrin rivers; area, 220 sq. m.; pop. in 1870, 15,935. The surface is undulating, and the soil a fertile clayey loam, with occasional ridges of sand. Iron ore is found. The Lake Shore and the Painesville and Youngstown railroads pass through it. The chief productions in 1870 were 84,164 bushels of wheat, 236,771 of rye, 202,948 of oats, 700,910 of potatoes, 99,058 lbs. of wool, 20,650 of hops, 409,550 of butter, and 22,009 tons of hay. There were 3,598 horses, 5,409 milch cows, 4,267 other cattle, 22,906 sheep, and 2,936 swine; 15 manufactories of carriages, 1 of drugs and chemicals, 1 of explosives and fireworks, 4 of iron castings, 3 of machinery, 3 of sash, doors, and blinds, 7 of tin, copper, and sheet-iron ware, 3 of tobacco and cigars, 2 of woollen goods, 3 planing mills, 13 saw mills, and 7 flour mills. Capital, Painesville. **III.** A N. W. county of Indiana, bordering on Lake Michigan and Illinois, bounded S. by the Kankakee river and drained by the Calumick and Deep; area, 468 sq. m.; pop. in 1870, 12,339. The surface is level and diversified by woodlands and prairies, with large marshes near the Kankakee; the soil is generally fertile. It is traversed by several railroads. The chief productions in 1870 were 63,398 bushels of wheat, 189,947 of Indian corn, 364,008 of oats, 73,516 of potatoes, 49,989 lbs. of wool, 557,820 of butter, 40,650 of cheese, and 40,994 tons of hay. There were 5,560 horses, 7,694 milch cows, 9,489 other cattle, 11,637 sheep, and 8,526 swine; 4 manufactories of carriages, 4 of brick, 1 of sash, doors, and blinds, 1 brewery, and 5 flour mills. Capital, Crown Point. **IV.** A N. E. county of Illinois, bordering on Lake Michigan and Wisconsin, and drained by Fox and Des Plaines rivers; area, 425 sq. m.; pop. in 1870, 21,014. The surface is chiefly an undulating prairie, diversified by tracts of timber and many small lakes. The soil is a rich, deep, black loam. The Chicago and Northwestern railroad passes through it. The chief productions in 1870 were 169,135 bushels of wheat, 517,353 of Indian corn, 699,069 of oats, 222,234 of potatoes, 318,042 lbs. of wool, 927,533 of butter, 128,207 of cheese, and 76,337 tons of hay. There were 8,087 horses, 12,167 milch cows, 10,787 other cattle, 67,763 sheep, and 13,385 swine; 8 manufactories of carriages, 2 of brick, 3 of cheese, 1 of pumps, 1 brewery, 1 planing mill, 3 tanneries, 3 curry-

ing establishments, 1 flour mill, and 1 saw mill. Capital, Waukegan. **V.** A W. county of the lower peninsula of Michigan, drained by the Notipeskago river and affluents of the Manistee; area, 576 sq. m.; pop. in 1870, 548. Capital, Chase. **VI.** A N. E. county of Minnesota, bordering on British America and Lake Superior; area, 4,500 sq. m.; pop. in 1870, 135. A chain of lakes extends along the N. border, and the S. E. portion is watered by numerous streams that empty into Lake Superior. The surface is broken by rugged ranges of drift hills. Copper and iron are found. Capital, Beaver Bay. **VII.** A N. W. county of California, bounded E. by the Coast range; area, 972 sq. m.; pop. in 1870, 2,969, of whom 119 were Chinese. It contains Clear lake, which receives numerous streams, and empties through Cache creek into the Sacramento. The valleys of the lake and streams are productive, and the hills afford pasturage. Borax lake, covering 300 acres, near Clear lake, yields that commodity abundantly. In the S. E. part are valuable quicksilver mines. Sulphur is found on the E. side of Clear lake, and copper and other minerals in various localities. The chief productions in 1870 were 87,016 bushels of wheat, 11,615 of Indian corn, 3,894 of oats, 67,946 of barley, 5,154 of potatoes, 58,046 lbs. of wool, 84,268 of butter, 63,340 of cheese, and 5,296 tons of hay. There were 1,984 horses, 1,827 milch cows, 2,408 other cattle, 16,307 sheep, and 11,547 swine; 4 saw mills, and 1 establishment for smelting quicksilver. Capital, Lakeport. **VIII.** A W. county of Colorado, bounded E. by the Rocky mountains, and W. by Utah; area, about 12,500 sq. m.; pop. in 1870, 522. It is watered by the Gunnison and other tributaries of Grand river. The Arkansas rises in this county, and flows S. E. near the E. border. Along this river and near the head waters of the Gunnison gold mining is carried on to some extent. The surface is broken by a continuous series of spurs and ranges, extending from the Rocky mountains to the N. and W. borders, but there are numerous fertile valleys and small parks, and much of the county is adapted to grazing. Timber is abundant. In 1870 there were 13 placer and 2 quartz gold mines. The chief productions were 2,173 bushels of wheat, 5,338 of oats, 6,530 of potatoes, and 111 tons of hay. The value of live stock was \$47,673. There were 1 flour mill and 3 saw mills. In 1874 the S. portion was set off to form Hinsdale and La Platte cos. Capital, Dayton. **IX.** A S. E. county of Dakota territory, recently formed and not included in the census of 1870; area, 720 sq. m. It is drained by affluents of Vermilion river and of the Big Sioux.

**LAKE, Gerard**, viscount, an English general, born July 27, 1744, died Feb. 20, 1808. He successively served in the seven years' and the American war, and under the duke of York in Holland, became general, and was commander-in-chief during the Irish rebellion of 1797-8.

In 1800 he went to India in the same capacity, and achieved victory after victory during the Mahratta war (1803), storming Alighur, occupying Delhi and making the old and blind Mogul emperor Shah Allum the vassal of England, capturing Agra, and winning a decisive battle near Laswaree (Nov. 1), which brought the districts N. of the Chumbul into British possession, and for which he was made a baron (Sept. 1, 1804). Subsequently he was engaged in warfare against Holkar (1804-'5), and after his return to England he was made a viscount, Oct. 31, 1807. The third viscount, Warwick Lake, dying June 24, 1848, without male issue, the title became extinct.

**LAKE, Henry Atwell**, an English soldier, born about 1809. He is a younger son of Sir James Samuel William Lake, and rose in the engineer service in India (1826-'55) to the rank of lieutenant colonel. In the Crimean war he rendered Kars almost impregnable, and was called by the Russians the English Todleben, and was not held responsible for the surrender of that stronghold (1855). With Gen. Williams he was a prisoner of war in Russia till the restoration of peace, and after his return to England he published "Kars and our Captivity in Russia" (London, 1857). Subsequently he was made colonel, aide-de-camp to the queen, and chief commissioner of the Dublin police.

**LAKE DWELLINGS**, a class of prehistoric habitations existing in some form in various parts of the world, but found in greatest perfection and most thoroughly explored in Switzerland. In Scotland and Ireland they are called crannoges. They are of two kinds, fascine dwellings and pile dwellings. The former were built on a foundation of reeds or tree stems, woven together in horizontal layers alternated with layers of clay or gravel, the whole mass sunk in the water and kept in place by a few stakes or piles. The pile dwellings were built on platforms supported by piles driven deeply into the lake bottom, but projecting above the water. Though the fascine dwellings were the simpler, they were not necessarily the more ancient; the explorations in Switzerland show that they were commonly used in the smaller lakes, and where the bottom was too soft to hold a mass of piles firmly, while the pile dwellings were invariably constructed in the large lakes, where the waves would have swept away a foundation of fascines. Lake dwellings date back to the stone age, and are still in use in some parts of Russia, in Borneo and other islands of the Malay archipelago, and in central Africa. Herodotus relates (book v., 16) that certain tribes of Pæonians lived in pile dwellings on Lake Prasias in Thrace, and as these were connected with the shore by a single narrow bridge, they defied the troops of Darius when their kindred tribes were led away into Asia. Each family had its own hut, with a trap-door beneath, through which they fished by letting down a basket. The infant children were tied by the foot with a cord, to

prevent their falling into the water. Hippocrates records that the colonists of the Phasis lived in reed huts in the middle of the river. Certain Assyrian bass reliefs represent inhabited artificial islands formed of woven rushes. Venezuela received its name (little Venice) from the Spanish discoverers because of the houses built on piles in the lagoon of Maracaibo. The lake dwellings of extinct peoples represent all stages of civilization from the age of stone to the dawn of the iron age. Those of Lake Moosseedorf, Switzerland, are supposed to be the oldest, and those of Ireland the most recent.—In 1829 an excavation on the shore of Lake Zürich at Obermeilen revealed the existence of ancient piles and other antiquities, but no extended examination was made. The winter of 1853-4 in Switzerland was one of extraordinary drought and cold; the rivers shrank to their smallest dimensions, and the level of the lakes was lower than had ever before been known. The inhabitants on the shore of a little bay between Obermeilen and Dallikon took advantage of the low water to extend their gardens by building a wall and filling the space back of it with mud dredged from in front. The dredging brought to light the heads of a system of piles, great quantities of stags' horns, and several ancient implements. Dr. Ferdinand Keller followed up this discovery, and similar remains of prehistoric villages were found in Lakes Zürich, Constance, Geneva, Bienne, Neuchâtel, Morat, and several of the smaller lakes of Switzerland. From 20 to 50 settlements have been explored in each of the larger lakes; and immense numbers of implements of horn, bone, stone, bronze, and pottery have been found, with a few of gold, wood, and iron, mingled with bones of animals, and in a very few cases human remains. The most perfect example of a lake dwelling of the stone age was in the little lake of Moosseedorf, near Bern. The water was artificially lowered 8 ft. in the winter of 1855-6, which revealed a settlement at each extremity of the lake; the one at the eastern end was most thoroughly examined. The piles had been driven irregularly, the mass forming a parallelogram 55 by 70 ft. They were stems of oak, birch, fir, and aspen, from 5 to 7 in. in diameter, some being split and some still retaining the bark. The remains of a bridge which had connected the settlement with the shore were found. The superstructure had apparently been destroyed by fire, only portions of the charred wood remaining. The implements were found, not in the mud of the ancient lake bottom, but in a stratum next above it, now called the relic bed, consisting of loose peat, gravel, clay, wood, and charcoal, from 5 in. to 2 ft. thick. Many of the heaviest implements were near the top of the bed, and many of the lightest near the bottom. Among them were a harpoon of stag's horn, a flint saw fastened with asphalt in a handle of fir wood, needles made of boars' teeth, awls, knives, pincers, chisels, and arrow

heads of bone, fish hooks of boar's tusk, and a comb of yew wood. There were also numerous bones of animals, some of which bore the marks of stone axes and saws; a few fragments of pottery, some incrustated with soot; linseed, and burnt wheat and barley. Every

1. Knife of boar's tooth. 2. Bone chisel. 3. Bone knife. 4. Bone awl. 5. Flint saw, in handle of fir wood. 6. Harpoon of stag's horn. 7. Comb of yew wood. 8. Wedge of fir wood. 9. Fish hook of boar's tusk. 10, 11. Needles of boar's tusk.

hillock in the marsh land around this settlement is full of chips and flakes and unfinished instruments of flint. The lake dwellings situated in what are now peat moors offer in some respects a better opportunity for investigation than those which are still under water. The best specimen of this kind was discovered in 1858 at Robenhäusen near Lake Pfäffikon, in the canton of Zürich. The space covered with piles is an irregular quadrangle containing nearly three acres, which must have been about 2,000 paces from the ancient western shore of the lake in which it stood, and about 3,000 from the eastern; the piles of a bridge connecting it with the latter still remain. The piles of this village, numbering about 100,000, were of oak, beech, and fir, some of them being split, were 10 or 11 ft. long, sharpened with stone hatchets, and driven in from 2 to 3 ft. apart. The platform was made of cross timbers and boards, fastened to the piles with wooden pins. The outermost piles were bound together with hurdle work. Investigation revealed three systems of piles, one above the other, indicating different periods of habitation. The piles of the two lower systems are round stems of soft wood, those of the uppermost split trunks of oak. Here were found mealing stones, hearth stones, wheat and barley, 8 lbs. of bread, burnt apples and pears, beech nuts, acorns, cherry stones, flax, cords, nets, mats, and woven cloth of bast and of flax, an abundance of broken pottery, many

flint weapons, tools of horn and bone, several implements of maple wood, two or three long bows such as are still used by the South sea islanders, and a canoe 12 ft. long, 1½ ft. broad, and 5 in. deep. The relic bed is 3 ft. thick. It is conjectured that the settlement was inhabited for many centuries, and that the first two structures were destroyed by fire, as the heads of the piles are charred and quantities of charcoal are found in the relic bed. The direction and arrangement of the masses of charcoal suggest that at least one of the fires occurred during the strong south wind (*Föhn*) by which at some time nearly every town in Switzerland has suffered. Almost the entire shore of the Untersee was lined with lake dwellings; those at Wangen have been most carefully explored and have yielded a greater abundance of articles than any other. Here were found numerous spindle whorls of clay, charred flax in all stages of manufacture, baked bread, and nearly 100 bushels of grain. Fascine structures are found at Niederwyl and Wauwyl. In the former split stems and boards were largely used, and some of the beams were mortised. There is no trace of burning. At Nidau-Steinberg, on the lake of Biene, is a lake settlement in which have been found manufactured articles of wood, horn, bone, clay, flint, bronze, iron, and gold. It is especially rich in bronze relics, consisting of hatchets, knives, sickles, spear heads, chisels, pins, needles, fish hooks, rings, and wire. The articles of iron include spear heads and two curved plates riveted to a piece of wood be-

large. At Morges the moulds for casting bronze hatchets were found. But in none of the lake dwellings is there any evidence of the use of the potter's wheel. The only one of the Swiss lake dwellings which bears the distinctive characters of the iron age is at Marin, on the lake of Neufchâtel. Here were also found rings, balls, and beads of glass, colored blue and yellow, and portions of eight human skeletons, including one skull. The number of iron weapons and implements found here is very large, and many of them are ornamented. Dr. Keller declares that "these ornamentations do not show the least relation to the Celtic implements which have come to light, and quite as little to those of Roman origin." He believes that the swords and lance points came from the workshops of Gaul.—Various attempts have been made to estimate the age of these lake dwellings, the form and size of the superstructures, and the number of inhabitants; but the figures obtained are largely the result of conjecture, and have very little value. Nor is it certain what was the exact reason for building on the water instead of on land. Protection from hostile tribes, safety from wild beasts, and convenience for fishing have been suggested, but are far from satisfactory. It seems pretty clear that they were not merely temporary abodes, that domestic animals as well as human beings were housed in them, and that some of them were abandoned without being burned. The scarcity of human remains is an enigma to archæologists, and not the slightest clue appears as to the manner in which the lacustrians disposed of their dead. Dr. Oswald Heer, in his work on the plants of the lake dwellings, says they show connection with the countries of the Mediterranean, but none with eastern Europe. The cereals were identical with those of the ancient Egyptians. The fauna of the lake dwellings includes a large number of fishes and birds still common to the country (but with no trace of any domestic fowl), and the bear, the dog, the ass, the ibex, the sheep, the cow, the hog, and other large animals, many of them belonging to extinct species. Since the discovery of the lake dwellings of Switzerland, similar structures have been found in Italy, Bavaria, Saxony, the French Jura, and other parts of Germany and France, and in Denmark.—The first discovery of crannoges in Ireland was made by William R. Wilde in 1839, near Dunshaughlin, county Meath. The lake of Lagore being drained, a circular mound 520 ft. in circumference, which had been known as an island, was seen to be of artificial construction. Oak piles had been used, mortised into planks laid flat on the bottom of the lake, and strengthened with cross beams. Some of the piles were grooved to hold panels which were driven down between them. The space within was filled with peat intermingled with bones of horses, asses, deer, sheep, goats, dogs, and foxes, and contained a large number of ornaments, weapons, and

Bronze Implements from Unter Uhldingen.—1. Sickle. 2. Pin. 3. Fish hook. 4. Socketed celt. 5. Knife. 6. Lance point. 7. Pin.

tween them; the articles of gold are a corrugated plate and a spiral of square wire. Some of the piles in this settlement are 10 in. in diameter, and were sharpened by the action of fire. Much of the pottery found here was unbroken, and some of the vessels were very

utensils of wood, bone, stone, bronze, and iron; 150 cart loads of bones were taken out. The ancient annals of Ireland relate that the island in Lake Lagore was plundered and burned by a hostile chief in 848, and that the buildings were pulled down by Norse pirates in 933. More than 50 crannoges have since been discovered in Ireland, and as many in Scotland. The latest discovery in Scotland (1871) is in Loch Etive, a platform 60 ft. in diameter, with a dwelling 50 by 28 ft. No essential difference of construction has been noted between those of the two countries.—See Keller, *Die Pfahlbauten in den Schweizerseen* (3 vols., Zürich, 1854-'60; English translation, London, 1866); Troyon, *Habitations lacustres* (Lausanne, 1860); Rutimeyer, *Die Fauna der Pfahlbauten* (Basel, 1861); Schaub, *Die Pfahlbauten in den Schweizerseen* (Zürich, 1864); Heer, *Die Urwelt der Schweiz* (Zürich, 1864-'5; English translation, "Primeval Life in Switzerland," London, 1874), and *Die Pflanzen der Pfahlbauten* (Zürich, 1865); Lyell, "Antiquity of Man" (London, 1863); Lubbock, "Pre-Historic Times" (London, 1869); and "Palafittes of the Lake of Neuchâtel," by E. Desor, in the Smithsonian report for 1865.

**LAKE OF THE WOODS** (Fr. *Lac des Bois*), a body of water in the Northwest territories of Canada, on the frontier of Minnesota, about lat. 49° N., lon. 95° W. It is 300 m. in circumference, and has an irregular outline indented with bays. A vast number of small islands dot its surface. The Winnipeg river flows from it on the north, and it receives Rainy river on the south. Wild rice grows plentifully along its shores.

**LALANDE, Joseph Jérôme Le Français de**, a French astronomer, born in Bourg-en-Bresse, July 11, 1732, died in Paris, April 4, 1807. His family name was Le Français, but he assumed that of Lalande at the outset of his scientific career. He was educated in the college of the Jesuits at Lyons, and was sent to Paris to study law; but making the acquaintance of De Lisle, he devoted himself to astronomy under him and Le Monnier. The latter in 1751 procured him a scientific mission to Berlin, where he was to ascertain, through astronomical observations, the distance between the earth and the moon, while La Caille was making similar observations at the Cape of Good Hope. He was presented to Frederick the Great, and, although but 19 years old, was made a member of the Berlin academy of sciences. On his return in 1753, he was elected to the French academy of sciences, assisted Clairaut in his researches on comets, especially that of Halley, and in 1760 became the editor of the *Connaissance des Temps*, which he conducted till 1775, and subsequently from 1794 till his death. In 1762 he succeeded De Lisle in the chair of astronomy at the collège de France, and during 45 years delivered lectures on that science. He reached the height of his fame when he published a map illustrating the

two transits of Venus which were to take place in 1761 and 1769, and showing the exact time of those transits for all countries on the globe. About the same time he announced to the world the results of the calculations through which the distance between the sun and the earth had been definitely ascertained. He gave much attention to navigation, and delivered lectures and published works on this subject, which are highly valued. But the popularity acquired by his scientific labors did not satisfy his thirst for fame; and in order to keep public curiosity constantly alive, he stationed himself on the Pont-Neuf to give astronomical explanations to passers by; announced that he would travel in a balloon from Paris to Gotha, where a scientific congress was to be held; had it reported that he ate spiders, caterpillars, worms, and other insects; and professed the boldest atheism. Lalande's principal work is the *Traité d'astronomie* (2 vols. 4to, Paris, 1764), which exceeded in utility all previous treatises of the kind.

**LALEMANT**, a Parisian family, of which several members were prominent in the early French missions in Canada. **I. Charles**, born Nov. 17, 1587, died in Paris, Nov. 18, 1674. He became a Jesuit in 1607, and in 1625 went to Canada, where he was superior of the missions. While going with ships to the relief of Quebec in 1629, he was wrecked near the mouth of the St. Lawrence, and narrowly escaped, some of his associates being drowned. He returned to Canada in 1634, after its restoration by England, when he took charge of the church of Notre Dame de Recouvrance in the lower town of Quebec, and opened the first school. After attending Champlain on his deathbed he returned to Europe in 1638, was rector of colleges at Rouen, La Flèche, and Paris, superior of the professed house, and vice provincial. Several of his letters have been printed: *Copie de trois lettres écrites es années 1625 et 1626* (Albany, 1870, reprinted from Sagard and Martin); *Lettre envoyée au P. Hierosme l'Allemant, où sont contenus les mœurs, &c., des sauvages* (Paris, 1627, and in the *Mercurie Français*, 1628; both, Albany, 1870); *Lettre envoyée de Bordeaux*, describing his shipwreck, published in Champlain (Paris, 1632; Albany, 1870). **II. Jérôme**, brother of the preceding, born in 1593, died in Quebec, Jan. 26, 1673. He entered the Jesuit order in 1609, and went to Canada in June, 1638, having been rector of several colleges in France. He was on the Huron mission till 1645, and was superior of all the missions in Canada from 1644 to 1650; made two voyages to France, where for a time he was rector of the college of La Flèche, but returned again in 1659 with Bishop Laval as superior of the missions, having been recommended to the king by the Canada company for the bishopric. He is the author of five of the "Jesuit Relations" of the Huron missions, and of six of the general volumes, for the years 1645-'8 and 1661-'4. **III. Gabriel**,

nephew of the preceding, born Oct. 30, 1610, killed March 17, 1649. He also entered the society of Jesus (1630), went to Canada in September, 1646, and was sent to the Huron mission. In the overthrow of that nation by the Iroquois he fell into the hands of the savages, and with Father Brebœuf was put to death with exquisite torture, prolonged for many hours.

**LALLEMAND, Claude François**, a French physician, born in Metz, Jan. 26, 1790, died in Marseilles, Aug. 25, 1854. After serving as assistant surgeon in the armies of the empire, he studied in Paris at the Hôtel-Dieu under Dupuytren, and from 1819 to 1845 was professor of clinical surgery at Montpellier, with the exception of three years during which he was suspended for his liberal political expressions. His most important work, the *Recherches anatomico-pathologiques sur l'encéphale et ses dépendances* (Paris, 1820-'36), established his reputation, and was translated into many languages. In 1845 he was elected to the academy of sciences, and removed to Paris, and was consulted by patients from every part of Europe. He bequeathed 50,000 francs to the institute.

**LALLY, Thomas Arthur**, count, baron of Tulledally or Tollendal, in Ireland, a French soldier, born in Romans, Dauphiny, in January, 1702, beheaded in Paris, May 9, 1766. He was the son of Sir Gerard Lally, an Irish loyalist, who accompanied James II. in his exile to France. He was educated to the profession of arms, and when scarcely 12 years old performed his first military service at the siege of Barcelona. For his gallantry at the sieges of Kehl in 1733 and Philippsburg in 1734, where he saved his father's life, he was promoted to the rank of major. In 1737 he visited England, Ireland, and Scotland, with a view to promote the interests of the pretender; and in 1738 he was sent on a secret mission to St. Petersburg. In 1745 he distinguished himself at the battle of Fontenoy, where he led the Irish brigade whose gallantry secured victory to the French. Louis XV. made him brigadier general on the field. The same year, at the head of a body of volunteers, he landed in Scotland, joined the young pretender Charles Edward, and served as his aide-de-camp at the battle of Falkirk. In 1755, being consulted by the French ministry upon the best mode of impairing the power of England, he strongly urged an attack upon her East Indian possessions. He was offered the command of an expedition to carry out his plan, received the appointment of governor general of the French establishments in the East, and sailed for his destination, May 2, 1757. But the means which had been placed at his disposal were wholly inadequate. He landed at Pondicherry, April 28, 1758, and found that the agents of the French East India company were secretly against him. Nevertheless, the Coromandel coast was conquered in a few weeks. He overcame all the obstacles thrown in his way, laid siege to Madras in

the month of December, carried the Black Town, and had some prospect of success; but being unsupported by D'Aché, the commander of the French fleet, and having no money to pay his mutinous soldiers, he was finally obliged to retire on the arrival of an English fleet. Soon after he found himself besieged in Pondicherry by an enemy ten times his superior in numbers. He held out for ten months; but deserted by his fleet, betrayed by the agents of the French company, having exhausted his resources, and the garrison being reduced to 700 men, he was finally compelled to surrender at discretion, Jan. 14, 1761, to Gen. Coote, who had 22,000 troops under his command and was supported by 14 ships. He was carried as a prisoner to London; but having heard that he was charged by his personal enemies with various crimes, he obtained his release on parole, went to Paris, and voluntarily entered the Bastille, in order to hasten his trial, but was left there for 19 months without examination. Finally he was accused as a traitor and a defaulter by the men who had been the cause of his ruin, and a mock trial took place; witnesses of the worst character, some of whom were his own servants, were admitted to testify against him; he was refused counsel, and was not even allowed to present his defence; and at last, after a protracted secret deliberation, he was sentenced to death and executed. Several years afterward the whole of these proceedings were revised, and the sentence was finally reversed in 1778.

**LALLY-TOLLENDAL, Trophime Gérard**, marquis de, a French politician, son of the preceding, born in Paris, March 5, 1751, died March 11, 1830. Although of legitimate birth, he was brought up, under the name of Trophime, in ignorance of his parentage until the eve of his father's execution. He first made himself known by his untiring efforts, during 12 years, to procure the reversal of his father's sentence, in which he secured the assistance of Voltaire, who wrote in his behalf. In 1789 he was one of the deputies of the nobles to the states general; he supported moderate reforms, and favored the establishment of a constitutional monarchy with two chambers and an absolute power of veto vested in the king; but after the events of Oct. 5 and 6 he was so alarmed at the course of the revolutionists that he retired with Mounier to Coppet in Switzerland. There, under the title of *Quintus Capitolinus aux Romains*, he published in 1790 a pamphlet censuring the proceedings of the constituent assembly. He returned to Paris in 1792 to oppose the Jacobins, and was imprisoned, but escaped to England a few days previous to the September massacre. In 1793 he asked to be appointed one of the counsel of King Louis XVI., but was not answered. He returned to France after the 18th Brumaire, and lived in retirement until the return of the Bourbons, when he was made a peer.

**LAMA.** See LLAMA.

**LAMAISM** (Thibetan, *bLama*,\* lord, master, teacher), the prevailing religion of Thibet and some other parts of Asia. It is a form of Buddhism modified by the adoption of some of the doctrines and practices of Sivaism, one of the religions of India, and Shamanism or spirit worship, a Mongolian superstition. The most essential features of Lamaism are described in the article **BUDDHISM**, vol. iii., pp. 399 *et seq.* Of the religion of Thibet previous to the introduction of Buddhism nothing certain is known. According to the Thibetan and Chinese annals, a king of Thibet named Srong-bTsan-sGam-po (the upright wise prince), who reigned in the early part of the 7th century, was the introducer of Buddhism into that country. He had two wives, one from China, the other from Nepal, in both which countries Buddhism had been established for several hundred years. These princesses brought with them Buddhistic books and idols. For the preservation of the latter, temples were built at Lassa (*Lha-ssa*, god-land), which afterward became and still remains the great metropolis of Lamaism. In 632 Srong-bTsan sent his prime minister Thumi-Ssam-bho-ta to Nepal to study Buddhism, and to adapt the Devanāgarī or Sanskrit alphabet, to the Thibetan language. This king also introduced the wonderful mystic formula of six syllables, *Aum ma-ni pad-me hum*, which is supposed to mean, "God! jewel in the lotus, Amen." It is a kind of universal prayer or invocation, and great spiritual and corporeal benefits are attributed to its utterance. During the century following the death of Srong-bTsan, Buddhism made but little progress in Thibet; but it received a new impulse from Thi-Srong-de-bTsan, who reigned from 740 to 786. He built many monasteries, invited to his court learned men from India, and completed the translation of the *bKa' hGyur* (pronounced *Kanjur*, *versio verbi*), the great canon in three sections, and containing, in 100 volumes, 1,083 different works, treating of everything connected with the doctrines and discipline of Buddhism. The third king who is regarded as sacred by the Lamaists was Khride-Srong-bTsan, who increased the power of the priesthood until it became unendurable, and he was murdered by the supporters of his brother gLang-dar-ma, between 821 and 840. The latter immediately commenced a bloody persecution of Buddhism, in consequence of which the priests called him a *khubilghan* of Shisnus, or incarnation of the devil, and finally murdered him; but for a long time afterward the religion made little progress. In the 11th century a learned Buddhist, Jo-bo-Atisha, introduced several reforms, and by his efforts and those of his Thibetan disciples, especially Brom-bakshi, a new impulse was

given to the religion. New monasteries were established, and Kun-dGa-sRing-po, abbot of the monastery of Ssa-skya, about 1070, is said to have been the first grand lama of Thibet; but it is not certain that his authority was universally recognized. In the 13th century the greater part of Thibet was subject to China, and in 1279 it passed with the rest of the empire under the dominion of Kublai Khan, grandson of the Mongol conqueror Genghis Khan. Kublai Khan was a patron of learning and became a Buddhist. He took the lama of Ssa-skya under his protection, and subjected the whole country to his authority. This lama, who among his numerous titles bore that of *Ti-ssu*, emperor's teacher, is said to have contrived letters for the Mongolic language. Kublai and Ti-ssu, with the aid of Thibetan, Uiguric, Chinese, and Sanskrit scholars, revised the *Kanjur*, and it was printed at the sNar-thang monastery in 1285-1306. He also sent an embassy to Ceylon, which brought back the bhikshu bowl, two molar teeth, and a miraculous image of Sākyamuni. The successors of Kublai were equally zealous. Temples were restored, convents were erected in China as well as Thibet, and so many Chinese pretended to be monks in order to escape payment of taxes and the performance of other duties, that it is said 500,000 of these impostors were expelled from the cloisters of a single province. After a rule of 89 years the Mongol dynasty called by the Chinese the dynasty of Yu-en was expelled, and in 1368 the Ming dynasty was established. In 1373 Tai-tsu, the Chinese emperor, desirous of lessening the power of the lama of Ssa-skya and of increasing the influence of China, conferred equal dignities and titles upon four lamas. This policy of dividing and thus weakening the power of the lamas was followed by the succeeding emperors, though the lama of Ssa-skya was still regarded as the highest in dignity. In 1403 a lama named bTsong-Kha-pa commenced a great reform. Many wonderful legends of his miraculous conception and birth are preserved, and he is regarded in Thibet, Mongolia, and among the Calmucks with almost as much reverence as Buddha himself. He proclaimed the duty of celibacy on the part of the priesthood, originated the sect or order of *dGe-lugs* (of virtue), wrote many works, and founded many monasteries. Previous to his time one of the distinguishing marks of the priesthood had been a red cap. He and his followers adopted a yellow cap, as being more in accordance with the original custom of the Buddhists. The Lamaists thus became separated into two sects, which to this day are called red-caps and yellow-caps, but at present the sect of red-caps in Thibet is very small and of little importance. Some time between 1417 and 1429 bTsong-Kha-pa died, or, as his followers believe, was translated to heaven.—The organization of the lamaistic hierarchy as it exists at the present day is essentially the same as it was left by

\* Throughout this article a small letter unaccompanied by a vowel and immediately followed by a capital, is not pronounced; thus *bLama* is pronounced Lama. Such is the Thibetan spelling and pronunciation.

bTsong-Kha-pa. At the head are two lamas of equal sanctity, who consecrate each other. The one is called dalai lama, *dalai* being a Mongol word signifying "ocean." In the Tibetan language dalai is rGya-mThso, but the Mongol word is generally used. He resides at Potala near Lassa. The other is called pan-tchhen lama, *pan-tchhen* signifying great-teacher-jewel, but used very much as our words "right reverend." He is also called tesho lama and bogdo lama, especially in Europe. He resides at bKra-Shiss-Lhun-po, near gShiss Ka rTse or Dzigartchi. Both lamas have many other titles, the chief of which are rin-po-tchhe, precious jewel, and rGyal-po, king. Although in theory the two lamas are in all respects equal, yet the dalai lama presides over a far greater territory and his influence is much greater than that of the bogdo lama. Their followers believe that these two lamas never really die. When the body of one of them perishes, he immediately becomes incarnate in some boy of four or five years, who must be found by the lamas next in dignity to the two highest, under the direction of the surviving grand lama, and taken under their care to be educated for his high office. Many solemn forms are gone through with, and the child when found is subjected to many tests to determine whether he is the real incarnation of the departed lama. As a matter of fact, however, at the present day the choice always falls upon some one satisfactory to the emperor of China. The dalai lamas are supposed to be the successive incarnations of Avalokitesvara, a bodhisattva, and the patron saint of Thibet, while the bogdo lamas are regarded as incarnations of the great reformer bTsong-Kha-pa, himself, according to the prevailing opinion, an incarnation of the bodhisattva Amitâbha. Jo-bo-Atisha and Brom-bakshi are considered the prototypes of the double lama papacy. The next in rank to the two grand lamas are the *khutuktus* or vicars, who may be compared to the cardinals and archbishops of the Catholic church. Of these there are from seven to ten, though some authorities place the number much higher. They represent the authority of the dalai lama in the different provinces, and almost all the civil power is also in their hands. They are khubilghans, or incarnations of former saints, and share with the grand lamas the right to the title *rin-po-tchhe* or precious jewel. Women sometimes attain to this rank. The third class is composed of those who are called simply khubilghans or incarnates. This is a Mongol word, but much more generally used than *byangtchhab*, the corresponding Tibetan name, and a translation of the Sanskrit *bodhisattva*. Their number is very great. They are at the head of a large proportion of the monasteries, and fill other important offices. The two grand lamas, the *khutuktus*, and the khubilghans constitute that portion of the hierarchy to whom, as being the incarnations of former existing saints, a peculiar sanctity is

attached. They are principally taken from privileged families, and political considerations have more or less influence in their selection. The second great division of the hierarchy is composed of four classes, which in ascending order are as follows: 1, the *genyen* (virtue-nourished) or novice, who is generally from 7 to 15 years old; 2, the *getsul*, or deacon, generally from 15 to 20 years old; 3, the *gelong* (virtue-beggar), or fully consecrated monk or priest, who must be over 20 years old; 4, the *khanpo* or teacher, master. The last are the abbots of the great monasteries, and often one *khanpo* has several smaller monasteries under his supervision. The third and last great division constitutes what may be called the academical or theological order. It is composed of: 1, the *kabtchee*, master, those who have given evidence in a public examination of their acquaintance with the ten most important books of the lamaistic religion; 2, the *rabjampa*, the overflowing, those who in a public discussion have shown their knowledge of the whole body of religious learning, and who are authorized to give instruction in the law, and are connected with those monasteries to which high schools are attached. There are two other learned degrees, which are conferred by the grand lamas only on persons who have distinguished themselves by extraordinary learning: the *tchoiji* or law-prince, and the *pandita*, which, as denoting the highest possible attainments, is very rare.—In no part of the world do the religious orders constitute so large a proportion of the population as in those countries where Lamaism is the prevailing faith. There are many vagabond or begging lamas, and a few hermits who live in caves. With these exceptions all lamas are monks or nuns, and are vowed to celibacy. The female lamas are called sisters-in-law, venerable aunts, &c., and are divided into classes corresponding to those of the male lamas. In Mongolia the lamas are estimated at one eighth of the whole population. The chief lama, or *gegen khutuktu*, is considered equal in rank to the two grand lamas of Thibet. He resides at Urga, on the road from Peking to Kiakhta, with about 20,000 monks and 30,000 families of slaves. In Thibet the great metropolis of Lamaism is Lassa, in which city and its neighborhood are 30 great lamaseries. The chief of these are Potala (Buddha's mount), the residence of the dalai lama and occupied by about 10,000 lamas; Sse-ra (golden), with 15,000 lamas; Brass-ssPungss (branch-heap), with a Mongolic school, 300 sorcerers, and 15,000 lamas; and dGa' iDan (joy of heaven), with 8,000 lamas. The two last named were founded by the great reformer bTsong-Kha-pa. These are not exceptional cases, but are specimens of hundreds of others which are scattered throughout central Asia. To several of them printing offices are attached. This vast horde of priests and monks are supported partly by their own labor, partly by the revenues

derived from their immense landed estates, and partly from the practice of arts founded on the superstitious reverence in which they are held by the rest of the population. They are physicians, astrologers, fortune-tellers, and magicians. Children are baptized on the third or tenth day after birth, and are confirmed as soon as they can speak and walk. These ceremonies must be performed by the lama. Marriage is a civil and not a religious rite, but the auspicious day for its performance can only be learned from the lama, and it is considered highly important that it should be accompanied by his prayers. The interment of the dead is forbidden, and there are no funeral ceremonies requiring the presence of the lama. After death the bodies of distinguished persons and of wealthy laymen are burned. The bodies of the common people are exposed to be devoured by beasts and birds of prey, or by sacred dogs kept for the purpose; but the auspicious day and hour when and the place where the body must be exposed must be determined by the lama. When rich persons are about to die, the lama must be present to assist the departure of the soul by making a small hole in the scalp. He also says masses for the departed soul until it is released from Yama, the infernal judge, and is ready to enter upon its new existence. For these and numberless other services the lama must be rewarded according to the means of the person for whose benefit they are rendered. The lamas also make and sell idols, amulets, relics, consecrated pills, and other things of this kind. They print all the books, and to them literary education is almost exclusively confined. There are three great festivals, and innumerable smaller ones. The first great festival, in commemoration of the victory of Sakyamuni over the six heretic teachers, is celebrated at the time of new moon in February. It also marks the commencement of the new year and of spring, and hence the victory of warmth and life over darkness and cold. It is the Thibetan carnival, and lasts for 15 days, during which the population abandon themselves to every kind of pleasure. The second is held in commemoration of the incarnation of Sakyamuni, and is the oldest festival of Buddhism. It marks the commencement of summer, and is characterized by the procession of idols. The third is the water festival at the commencement of autumn. Of the other festivals, the most important is the lamp festival, in commemoration of the translation to heaven of bTsong-Kha-pa. There are also a great number of fasts, the objects and characteristics of which it would be tedious to enumerate. Small chapels, prayer wheels, the turning of which is considered equivalent to the utterance of the prayers inscribed upon them, sacred inscriptions on walls and columns, and silken flags inscribed with prayers and hoisted upon consecrated poles, abound in the streets and along the highways. The lamas assemble three times each day for worship, at sunrise, noon, and sun-

set. The worship consists principally in the recitation of prayers and sacred texts, accompanied by a chaotic clamor of horns, trumpets, and drums. When the grand lama appears in public he sits cross-legged, is clothed in splendid robes of fine woollen or silk richly wrought with gold, and distributes his blessings in silence by the motion of his hands. The architecture of the lamaic temples is a mixture of the Chinese and Indian styles. They are square, and in Thibet always face the east, in Mongolia the south. They are divided into three apartments, the entrance hall, the main hall with two parallel rows of columns, and the sanctuary in which are the chief idol, the altar, and the throne of the chief lama. The walls are generally painted in lively colors, and the halls adorned with carpets, statues, and various ornaments. The temple is surrounded by the buildings necessary to supply the temporal and spiritual wants of the lamas, the whole forming the *dGon-pa*, monastery or lamasery.—The great body of lamaic literature is contained in two immense collections: the *bKwa hGyur* or *Kanjur* mentioned above, a copy of which is in the national library at Paris, and the *bsTan hGyur* (pronounced *Tanjur*), in 225 volumes, which consists mostly of translations from Sanskrit and Prakrit of treatises on dogmas, philosophy, ethics, medicine, grammar, and other sciences, of fragments of epic poems, vocabularies, and various other matters. The imperial library of St. Petersburg possesses both these collections. The *Kanjur* is regarded as sacred, the *Tanjur* merely as high authority. Only a very small number of lamas possess any real knowledge of either collection. Like other Buddhists, the Lamaists recognize no worship of gods. The essence of all that is holy is comprised in an ideal trinity designated by the name *dKon-mTehhog-gSum*, three precious jewels, viz., the Buddha, the doctrine, and the priesthood. Far beneath these are many good and evil beings, partly gods borrowed from the Indian pantheon, partly spirits from the ancient religions of the Mongol nations. The intervention of the lamas is necessary to propitiate these and ward off their evil influence, but they are not properly objects of worship.—See Csoma de Körös, "Asiatic Researches," &c.; Huc, *Souvenirs d'un voyage dans la Tartarie, le Thibet et la Chine* (Paris, 1852; English translation by W. Hazlitt, 2 vols. 12mo, 1852); Karl Ritter, *Erkunde von Asien*; K. Fr. Köppen, *Lamaische Hierarchie*, &c. (Berlin, 1859).

**LAMANTIN.** See MANATEE.

**LAMAR**, a N. E. county of Texas, separated from the Indian territory by Red river, and bounded S. by the N. fork of Sulphur river; area, about 950 sq. m.; pop. in 1870, 15,790, of whom 4,410 were colored. It has an uneven surface, diversified by woodlands and fertile prairies, and suitable for grazing. The chief productions in 1870 were 5,390 bushels of wheat, 474,361 of Indian corn, 9,104 of oats, 16,347 of sweet potatoes, and 6,753 bales

of cotton. There were 5,037 horses, 1,090 mules and asses, 5,196 milch cows, 1,061 working oxen, 14,249 other cattle, 3,986 sheep, and 22,030 swine; 3 manufactories of furniture, 5 of saddlery and harness, and 2 flour mills. Capital, Paris.

**LAMARCK, Jean Baptiste Pierre Antoine de Monet** de, a French naturalist, born at Bazentin, Picardy, Aug. 1, 1744, died in Paris, Dec. 18, 1829. He was a younger son of a noble family, formerly of Béarn, and being destined for the church was sent to the Jesuits' college at Amiens; but his father dying when he was 17 years old, he left his studies and joined the army under the duke de Broglie. He served until the close of the seven years' war, when he became incapacitated for military duty by an accident, returned to Paris, and studied medicine and the physical sciences. In 1776 he began his career as an author by the publication of his *Mémoire sur les vapeurs de l'atmosphère*. In 1778 he published his *Flore française*, containing a new arrangement of plants which was commended by Buffon and the academy of sciences. About the same time he accompanied the younger Buffon on a tour through Germany and Holland to procure botanical specimens; and he became also a companion in the botanical excursions of J. J. Rousseau. Being appointed editor of the botanical department of Panckoucke's *Encyclopédie méthodique*, the results of his researches were embodied in that work. The outbreak of the French revolution interrupted it and terminated Lamarck's botanical labors. In 1793, although he had given comparatively little attention to zoölogy, he was intrusted with the department of invertebrata in the museum of natural history in Paris. This branch of natural history became thenceforth the absorbing study of his life, and his lectures upon it, begun in 1794, were continued until the failure of his eyesight in 1818 incapacitated him for the duty. His first important work on this subject, *Système des animaux sans vertèbres* (1801), was the forerunner of a more elaborate treatise published many years later. In 1809 appeared his *Philosophie zoologique* (2 vols. 8vo), in which his theory of the development of animal functions, previously hinted at in an early work, is set forth at considerable length. It was his opinion that new organs could be produced in animals by the simple exertion of the will, called into action by the creation of new wants; and that the organs thus acquired could be transmitted by generation. In support of this doctrine, which is called appetency, he cited the existence of tentacula on the head of the snail, which derive their origin from the desire of the animal, united with endeavor perpetuated and imperceptibly working its effect through a series of generations, to possess organs capable of examining the bodies it encounters; and the same thing, he asserted, had happened "to all races of gasteropods, in which necessity

has induced the habit of touching bodies with some part of their head." He was an advocate also of spontaneous generation, and he believed that all organized beings, from the lowest to the highest forms, were developed progressively from similar living microscopic particles. He is considered the foremost modern originator of the theory of the variation of species, which Darwin has revived and developed. In 1815-'22 appeared Lamarck's chief work, *Histoire naturelle des animaux sans vertèbres* (7 vols. 8vo), by far the most comprehensive treatise on the invertebrata which had appeared, and of which the edition of 1834-'45, with notes by Deshayes and Milne-Edwards, is a standard manual on the subject. His division of the animal kingdom includes three groups, the apathetic, the sensible, and the intelligent. The first comprises *infusoria*, *polyparia*, *radiaria*, and *vermes*; the second, *insecta*, *arachnida*, *crustacea*, *annelida*, *cirripeda*, and *mollusca*; and the third, *pisces*, *reptilia*, *aves*, and *mammifera*. Some of his statements respecting the habits and functions of the apathetic animals have been disproved by the researches of Ehrenberg and other naturalists. His last work was his *Mémoires sur les coquilles*, published in the *Annales du muséum*, in which he was assisted by Valenciennes, and by his daughter.

**LAMARMORA, Alfonso di**, marquis, an Italian general, born Nov. 17, 1804. He was admitted to the military academy of Turin in 1816, and left it in 1823 with the rank of lieutenant of artillery. He took an active part in introducing reforms into the organization of the army, in the war against Austria in 1848, and in restoring order after the defeat at Novara in 1849. In 1855 he was commander of the Sardinian forces in the Crimean campaign, and in that of 1859 was the principal military adviser of Victor Emanuel. He also officiated on several occasions as minister of war and marine. After the peace of Villafranca and the retirement of Cavour, he was for a time chief of the cabinet, a position which he again held in 1864-'6, after having served on missions to Berlin and St. Petersburg, and as commander in Milan and Naples. In 1866 he concluded through Gen. Govone the alliance with Prussia, and resigned his premiership in order to take as chief of staff the virtual command of the army in the field. The defeat at Custozza (June 24), which was attributed to his mismanagement of the campaign, caused his retirement, and involved him in disagreeable controversies. In 1867 he was sent to Paris, subsequently became member of the Italian parliament, and in 1870-'71 was governor of Rome. In 1873 he published a volume of diplomatic memoirs, which made an immense sensation by the assertion that Bismarck in his negotiations with Gen. Govone in 1866 declared himself willing to cede a portion of Transhrenan Germany to France, in order to secure the friendly attitude of Napoleon III. in the impending war with Austria; a

statement which the German chancellor vehemently denied.

**LAMARQUE, Maximilien**, count, a French general, born in St. Sever, July 22, 1770, died in Paris, June 1, 1832. He enlisted in the army in 1791, was sent to Spain, reached the rank of captain, and joined the corps styled the *colonne infernale*, under the command of Latour d'Auvergne. In 1794, at the head of 200 soldiers, he stormed Fuenterrabia, for which he was rewarded with the rank of adjutant general, and a decree of the convention declared that he had "merited well of his country." After the peace with Spain, he served under Dessolles and Moreau on the Rhine, distinguished himself at Hohenlinden, and was made a brigadier general in 1801. He afterward joined the army under Napoleon, and participated in the battle of Austerlitz. He shared in the invasion of Naples, was present at the taking of Gaëta, smothered the insurrection in Calabria, and worsted some British detachments in 1807. In the same year he was made general of division, and in 1808, under Joachim Murat, who had succeeded Joseph Bonaparte as king of Naples, he captured the island and fortress of Capri, which was defended by the English garrison under Sir Hudson Lowe. He subsequently distinguished himself at Wagram, where he had four horses killed under him; and in Spain, where he led the rear guard when the French evacuated the Peninsula. On the return from Elba, Napoleon appointed him to the command of Paris, and sent him to the west against the royalists. On the second restoration he was exiled and retired to Brussels, where he devoted his time to literature, art, and the education of his son. In 1818 he was allowed to return to France, and settled in his native town. In 1828 he was elected to the chamber of deputies by the department of Landes, and took his seat among the opposition. He was one of the 221 members who boldly declared against the policy of Charles X. in 1830, but after the accession of Louis Philippe opposed the ministry, and bitterly denounced the system known as that of peace at any price. His honesty of purpose, sincerity, and martial eloquence gained him great popularity. His funeral, which took place June 5, 1832, was attended by a large concourse of citizens; and the republicans took advantage of it to raise a formidable insurrection in the most populous districts of Paris. The whole army in Paris and the national guard marched against the insurgents, who yielded after nearly 48 hours of bloodshed.

**LAMARTINE, Alphonse Marie Louis de**, a French poet, born in Mâcon, Oct. 21, 1790, died in Paris, March 1, 1869. His early education was superintended by his mother at the village of Milly, near Mâcon, where his father, who had passed the reign of terror in prison, had retired on the fall of Robespierre. In his 12th year he was sent to study Latin under a neighboring priest, who, a sportsman as well as an

ecclesiastic, afterward furnished the subject of *Jocelyn*. He was soon transferred to the college of Lyons, and again to the school of the Jesuits at Belley, whence he returned in 1809 to Milly and devoted himself to the reading of the poets. In 1811 he accompanied a relative to Italy. Near the close of the empire he returned to France, entered the royal body guards in 1814, and on the escape of Napoleon from Elba retired to Switzerland, returning to Paris after the second restoration. In 1817 he wrote his elegy of the *Lac*, in which he first displayed the ability of a great poet. His earliest published collection appeared in 1820 under the title of *Méditations poétiques*, and won a remarkable success, 45,000 copies being sold within four years. Soon afterward he was appointed secretary to the embassy at Naples. On his way thither he married at Geneva Miss Birch, a wealthy young English lady, who had received a brilliant literary and artistic education. In 1823 he published his *Nouvelles méditations*, which, though it contained many of his finest poems, was less popular than the preceding volume. In 1824 he became secretary of legation at Florence, and in 1825 appeared his *Dernier chant de Childe Harold*, an imitation of Byron, containing a severe tirade on Italy, which resulted in a duel with Col. Pepe, an Italian revolutionist, in which Lamartine was wounded. After a residence of five years in Florence, he returned to Paris, was received into the academy, and published *Harmonies poétiques et religieuses* (1830). In 1832 he set sail from Marseilles, with his wife and daughter, in a vessel chartered and furnished by himself, on a journey to the East, which had been the religious and romantic dream of his life. The French emir, as the Arabs called him, travelled like a sovereign, making princely presents, buying houses for his convenience, and having whole caravans of horses in his service. Leaving his family at Beyrout, he went alone to Jerusalem, where he heard of the death of his daughter. He returned to Paris after 16 months' absence, by way of Constantinople and the Danube, and published *Voyage en Orient, souvenirs, impressions, pensées et paysages* (4 vols., 1835), a work splendid in design, but in parts carelessly composed, and inexact in facts. During his absence the electors of Bergues, Le Nord, had chosen him to represent them in the chamber of deputies, in which he took his seat two months after his arrival in France. Though he acted with no political party, his eloquence gave him distinction, and many who doubted his aptitude for practical questions admired in his discourses the language of poetry applied to political affairs. In 1836 appeared *Jocelyn*, a poem of love and duty, announced as a journal found in a village curacy. It is one of his finest productions, combining dramatic movement with lyric fervor. Two years later followed *La chute d'un ange*, a poem whose negligences and extravagances justified the coldness of its

reception. Similar defects characterized his *Recueils poétiques* (1839). As an orator he made remarkable progress in the chamber. At once conservative and progressive, he stood between the ministry and the opposition, assailing the inflexibility of the one and the violence of the other. In 1842 he foreshadowed his ultimate adherence to the liberal side, by contending that the regency should be conferred on the duchess of Orleans by a vote of the chamber, thus asserting the principle of the national sovereignty; and in 1843 he broke definitely with the conservatives. He anticipated the subversion of the throne, and contributed powerfully to it in his brilliant *Histoire des Girondins* (8 vols., Paris, 1847). After the escape of the royal family, when the duchess of Orleans appeared in the last assembly of the chamber (Feb. 24, 1848) with her eldest son, the count of Paris, and an attempt was made to declare the latter king by acclamation, the eloquence of Lamartine decided the establishment of a provisional government, which he was among the first to propose. This included Dupont de l'Èure, who presided, Arago, Lamartine, Ledru-Rollin, Crémieux, Garnier-Pagès, Marie, Marrast, Flocon, Louis Blanc, and Albert. On the morning of the 25th, when the insurgent and famishing crowds appeared before the hôtel de ville, demanding bread and work, and the raising of the red flag, Lamartine advanced alone among them and gained his greatest triumph of eloquence. To his intrepid stand on this occasion it is mainly due that the republic did not pass immediately into a new reign of terror. He took the department of foreign affairs in the new government, and one of his first acts was to address a pacific circular to the ministers of foreign states, in which the design of forcible revolutionary propagandism was disavowed. His popularity was proved by his election to the national assembly (April 23) from 10 departments; but he fatally compromised himself by a coalition with Ledru-Rollin, and instead of receiving the first place in the executive commission which was to succeed the provisional government till the formation of a constitution, he was the fourth on the list, the others being Arago, who became president, Ledru-Rollin, Garnier-Pagès, and Marie. Crémieux, Carnot, Goudchaux, and others were attached as ministers. The "red" movement of May 15, under Blanqui, Barbès, Raspail, and others, having been subdued, Lamartine strove to prevent the insurrection of June, which the unsettled condition of labor and the socialist propaganda matured; but perceiving that the time demanded not reason but the sword, he favored the dictatorship of Gen. Cavaignac, and resigned his own executive office. He was supported for the presidency by Pelletan and La Guéronnière in the *Pays* newspaper, but received only 17,910 votes, and he was returned to the assembly in 1849 by but one obscure department. After the *coup d'état* of Dec. 2,

1851, he retired from public life. For several years his private affairs had demanded much of his attention. From the time of his oriental tour, the income of his writings and diminished fortune, and the illusive wealth of large territorial grants by the sultan, had been unequal to the expenditures incident to his elegant mode of life. He condemned himself therefore to indefatigable literary labors in the production of numerous works, often of ephemeral importance. His friends opened a subscription for him in 1858, but with unsatisfactory results. The municipality of Paris presented him in 1860 with a country seat near the Bois de Boulogne, and in 1867 the government of Napoleon III. gave him for life the income from a capital of 500,000 francs. His principal later publications are: *Trois mois au pouvoir* (1848); *Histoire de la révolution de 1848* (2 vols., 1849); *Confidences and Raphael* (1849), memoirs of his youth; *Toussaint l'Ouverture*, a drama (1850); *Geneviève* (1851); *Le tailleur de pierre de Saint-Point* (1851); *Histoire de la restauration* (6 vols., 1851-'3); *Visions* (1852), a poetic fragment; *Nouveau voyage en Orient* (1853); *Histoire des constituants* (4 vols., 1854); *Histoire de la Turquie* (6 vols., 1854); *Histoire de la Russie* (2 vols., 1855); *Regina* (1862); *Esprit de Mme. de Girardin* (1862); a series of literary portraits, *Bossuet, Antar, Cicéron, Christophe Colomb, Homère et Socrate, Nelson* (1863), *Héloïse et Abailard, Mme. de Sévigné, Shakespeare et son œuvre* (1864); *Civilisateurs et conquérants* (2 vols., 1865); *Les grands hommes de l'Orient, Vie de César, Les hommes de la révolution* (1865); *J. J. Rousseau, son faux contrat social et le vrai contrat social* (1866); *Vie du Tasse* (1866); and *Antoniella* (1867). He conducted at various times the periodicals *Le conseiller du peuple* (1849-'52), *Le civilisateur* (1852-'6), and the *Cours familier de littérature* (1856 et seq.). His *Correspondance* (4 vols., Paris, 1873 et seq.) was edited by his niece.—See Lacretelle's *Lamartine et ses amis* (Paris, 1872), Mazade's *Lamartine, sa vie littéraire et politique* (Paris, 1872), and *Vingt-cinq ans de ma vie*, translated into English by Lady Herbert (1872).

**LAMB, Lady Caroline.** See MELBOURNE.

**LAMB, I. Charles,** an English author, born in London, Feb. 18, 1775, died in Edmonton, Dec. 27, 1834. His father was servant and friend to one of the benchers of the Inner Temple, and published a volume of occasional verses which evince his humor and taste. His character is happily drawn under the name of Lovel in the essay of Elia on "The Old Benchers of the Inner Temple." In the Inner Temple Charles passed the first seven years of his life, and was then sent to the school of Christ's hospital, where he remained till his 15th year. Coleridge was his schoolfellow, and one of his earliest and most esteemed friends. But for a slight impediment in his speech he would have acquired a university education and taken orders. He was employed in the South sea house from 1789 to 1792, when he obtained an ap-

pointment in the accountant's office of the East India company, which he held until his retirement with a pension in 1825. To meetings with Coleridge on his visits to London, when they used to sup together at an inn, and sit in conversation nearly through the night, he attributed the first quickening of his intellect to literary activity; saying in a letter to him: "You first kindled in me, if not the power, yet the love of poetry, and beauty, and kindliness." There was a tendency to insanity in his family. He himself at the age of 20 was confined six weeks in a madhouse. He was not again affected, but the tendency was more strongly marked in his sister Mary. On Sept. 22, 1796, she killed her mother in a paroxysm of madness, and from this time she was subject to attacks of insanity. She always had premonition of them, and would indicate the moment when her brother should take her to the asylum. He devoted himself only to her, and admitted no connection which could interfere with his single care to sustain and comfort her. His first compositions were in verse, written slowly and at long intervals. His earliest printed poems are contained in a volume published conjointly with Coleridge and Charles Lloyd in 1797, and republished only in conjunction with Lloyd in 1798. In that year he produced also his prose tale of "Rosamund Gray," was associated with Coleridge and Southey in preparing a volume of fugitive poetry under the title of the "Annual Anthology," and was engaged in writing the tragedy of "John Woodvil," which was rejected by the managers, but was published in 1801. He made one other dramatic attempt, "Mr. H.," a pleasant farce, which was produced at Drury Lane theatre in 1806, with Mr. Elliston in the principal character. It was damned on the first night, and Lamb, who sat with his sister in the front of the pit, gave way to the common feeling, hissed and hooted as loudly as any one, and henceforth made a jest of the wreck of his dramatic hopes. He had already begun his studies of the old English authors, whom he always preferred to later writers with one or two exceptions, and published in 1808 his "Specimens of English Dramatic Poets who lived about the Time of Shakespeare," with appreciative and suggestive notes, which was more favorably received than his preceding works. To the "Reflector," a short-lived quarterly magazine edited by Leigh Hunt in 1810, he contributed some of his finest pieces, as the essay "On Garrick and Acting," which contains his character of Lear, the "Essays on Hogarth," and the "Farewell to Tobacco." His celebrity as an author and the circle of his literary friends had greatly increased when the establishment of the "London Magazine" in 1820 occasioned the compositions by which he acquired his most brilliant reputation, the "Essays of Elia," first collected in 1823, to which the "Last Essays of Elia" were added in 1833. In 1825 occurred one of

the principal events of his uneventful life, his retirement from his clerkship, which is described in his essay "The Superannuated Man." His salary had then become £700 a year, and he was allowed a life annuity of £450. Great consideration had uniformly been shown him by his superiors. So highly did he value the independence thus obtained by drudgery, that he advised one of his friends rather to seek five consolatory minutes between the desk and the bed, or even to throw himself "from the steep Tarpeian rock, slapdash, headlong upon iron spikes," than to rely solely upon literary labor for support. His exultation on his release appears in his letters: "I came home for ever on Tuesday in last week. The incomprehensibility of my condition overwhelmed me. It was like passing from life into eternity." Coleridge, Lloyd, Southey, Godwin, Manning, Wordsworth, George Dyer, Hazlitt, Talfourd, Bernard Barton, Leigh Hunt, Cary, Procter, De Quincey, and Hood were among those who shared his intimacy. Many of these were wont to meet at the Wednesday evening parties of Charles and Mary Lamb in his chambers in Inner Temple lane, which would occupy a large space in a literary history of his epoch, and which his biographer elaborately compares with the evenings of Holland house. Lamb presided over the motley group, stammering out puns, witticisms, and fine remarks, while his countenance is described as presenting a sort of quivering sweetness, "deep thought striving with humor, the lines of suffering wreathed into cordial mirth;" and his whole appearance resembled his own characterization of another person, "a compound of the Jew, the gentleman, and the angel." Though many of his curious sayings have been recorded, it is affirmed that they give no idea of the singular traits, the verbal felicities, and happy thoughts of his conversation. His single frailty was the eagerness with which from an early period of life he would quaff exciting liquors, snatching a fearful pleasure "between the acts of his distressful drama." He made a final abandonment of tobacco, though he had learned to smoke the strongest preparations of the weed, saying to Dr. Parr that he had toiled after this power as some men toil after virtue. His large intellectual tolerance, cherishing among his intimate associates men of every variety of philosophical, religious, and political opinions, has rarely been equalled. He delighted especially in individual peculiarities and oddities, and in all striking displays of human nature. During the last six years of his life he resided with his sister successively at Islington, Enfield, and Edmonton, often visiting his old associates in London, heavily afflicted by the deaths of Coleridge and Hazlitt, and with little disposition to write anything but verses and essays that were given to his friends. While taking his daily morning walk he accidentally fell, slightly wounding his face, and erysipelas ensued, which terminated fatally.

In his last moments, when nearly insensible to things around him, his mind seemed intent on hospitable purposes, and he proposed in broken sentences some meeting of his friends. Beneath all his inconsistencies, his fantastic ideas, subtle perceptions, absurd fancies, and mingling of jest with seriousness, the most constant and prominent feature of his character was amiability. The "Essays of Elia" hold a peculiar place in English literature. The style is a model of quaint and graceful elaboration, showing both his original genius and his familiarity with the fine sayings of the Elizabethan age; and they abound as well in profound thoughts as in the rarest fancies and felicities of expression. His works were edited, with a biography consisting largely of his letters, which are among the most delightful in the language, by Thomas Noon Talfourd (1 vol. 8vo, London, 1840; 4 vols., 1850; with addition of the "Final Memorials," 1 vol., 1852; 4 vols., 1855). The "Specimens of English Dramatic Poets," and other writings of his, are not included. The "Essays of Elia" have been published separately (Boston, 1860), and a volume of the uncollected writings of Charles Lamb, edited by J. E. Babson (Boston, 1864), since incorporated with several complete editions. **II. Mary Anne**, an English authoress, sister of the preceding, born in London in 1765, died in St. John's Wood, May 20, 1847. She resided constantly with her brother until his death, except when fits of insanity obliged her removal to the asylum. She wrote a few slight poems, and in conjunction with him the "Tales from Shakespeare" (1807) and a collection of juvenile tales entitled "Mrs. Leicester's School" (1808). The stories by her are, as Charles delighted to insist, the best of the collection. When well, she was remarkable for the sweetness and placidity of her disposition. On Charles Lamb's death the East India company granted to her the pension to which a widow was entitled, and her brother had besides made her comfort secure by his own savings. A volume of poems, letters, and remains of Mary and Charles Lamb, with reminiscences and notes, edited by W. Carew Hazlitt, was published in 1874.

**LAMBALLE, Marie Thérèse Louise de Savoie-Carignan**, princess of, born in Turin, Sept. 8, 1749, murdered at the prison of La Force in Paris, Sept. 3, 1792. She was early remarked for her intelligence, sweetness of temper, and personal beauty. In 1767 she was married to the prince of Lamballe, son of the duke of Bourbon-Penthièvre. This union was not happy, and the princess was about to seek a separation when her husband died, May 7, 1768. On the death of Marie Leszczyńska, a marriage was proposed between her and Louis XV.; but the project was defeated by Choiseul and his adherents. Marie Antoinette conceived a strong attachment for the princess, and on her accession to the throne appointed her superintendent of the royal household. The

princess proved a devoted friend. She saw without jealousy the growing favor of the duchess of Polignac, and silently kept aloof; but when the latter, on the breaking out of the revolution, deserted her mistress, she returned to her post. She was at the queen's side on the dreadful days of June 20 and Aug. 10, 1792, and accompanied her to the legislative assembly and afterward to the Temple. On Aug. 19 she was separated from her mistress and confined in the prison of La Force, where, despite the most energetic measures to save her, she fell a victim to the September massacre. When she appeared before the tribunal which passed sentence upon the prisoners, she answered with firmness and dignity. She refused to take the oath against the king, the queen, and monarchy; and scarcely had the verdict, "Out with her," been uttered, when she was struck down with a billet by a drummer boy and despatched with a sword; her body was mutilated and exposed, and her head placed on a pike, and carried first to the Palais Royal, where the duke of Orleans, her brother-in-law, was forced to salute it, and then to the Temple, where it was paraded under the windows of the queen. The *Mémoires relatifs à la famille royale de France* (2 vols. 8vo, Paris, 1826), gathered from her conversations and memoranda, and published by Mrs. C. Hyde, the marchioness Solari, are not considered authentic. Her biography has been written by M. de Lescure (Paris, 1864).

**LAMBERT, Daniel**, an English giant, born in Leicester, March 13, 1769, died in Stamford, June 21, 1809. Neither his parents, brother, nor sisters were of unusual size, but an uncle and an aunt were remarkable for corpulence. In his youth he excelled in strength, and was fond of field sports and other athletic exercises, but gave no indications that he was to attain excessive bulk till his 19th year. He soon after succeeded his father as keeper of the prison in Leicester, and his rapid increase in size from that time he attributed to his confinement and sedentary life. In 1793, when he weighed 448 lbs., he walked from Woolwich to London with less fatigue than several other men in his party. He was noted as a swimmer, and could float with two men of ordinary size on his back. Being incommoded by the curiosity of numerous visitors from the adjacent country, he decided in 1806 to exhibit himself in London. His apartments in Piccadilly became almost a place of fashionable resort, and his visitors were received with politeness, and treated him in the most respectful manner. He remained five months in the metropolis, and afterward exhibited himself in the principal towns of England. He was 5 ft. 11 in. high, and at his death he weighed 739 lbs. He measured 9 ft. 4 in. round the body, and 3 ft. 1 in. round the leg. He never drank any beverage but water, slept regularly less than eight hours a day, was healthy, active, and vivacious through life, and took part in all the sports of the field till within a few years of his death.

**LAMBERT, Johann Heinrich**, a German philosopher, born in Mülhausen, Alsace, Aug. 29, 1728, died in Berlin, Sept. 25, 1777. He was the son of a poor tailor, and was chiefly self-educated. He was at first a copying clerk, afterward secretary to the editor of a newspaper at Basel. In 1748 he went to Coire in Switzerland, and became private tutor in the family of Count Peter de Salis, then president of the confederation. In 1756-'8 he visited Holland, France, and Italy with his pupils. In 1759 he removed to Augsburg, but, having been appointed to determine the boundaries between the country of the Grisons and the Milanese, he returned to Coire in 1761, and sojourned there till 1763. In 1764 he went to Berlin, and was made a member of the royal academy of sciences; in 1770 he was appointed superior councillor of the board of works; and in 1774 was intrusted with the superintendence of the "Astronomical Almanac." He was regarded as the most analytical writer on scientific subjects of his day. The measurement of the intensity of light was first reduced to a science in his *Photometria* (Augsburg, 1760), and the theory of refraction was developed in *Les propriétés remarquables de la route de la lumière par les airs* (the Hague, 1759; Ger. translation, Berlin, 1773). Among his other works are: *Die freie Perspective* (Zürich, 1759); *Kosmologische Briefe über die Einrichtung des Weltbaues* (Augsburg, 1761); *Insigniores Orbitæ Cometarum Proprietates* (1761); *Neues Organon* (Leipzig, 1764); *Beiträge zum Gebrauch der Mathematik* (Berlin, 1765-'72); and *Anlage zur Architektonik* (Riga, 1771). His correspondence with Kant appears in the minor miscellaneous works of the latter.

**LAMBERT, John**, an English general, born in Kirkby-Malhamdale, in the West riding of Yorkshire, Sept. 7, 1619, died in the island of Guernsey in 1692. He was educated for the bar, but at the outbreak of the civil war entered the parliamentary army as a captain under Fairfax, and at the battle of Worcester, Sept. 3, 1651, was a major general. He was instrumental in procuring the recognition of Cromwell as protector, and was a member of the first parliament called by him. But upon the assumption by Cromwell in 1657 of sovereign power, and his inauguration with the solemnities applicable to monarchs, he refused to take the required oath of allegiance and retired from public life. After the death of Cromwell he associated himself with the general council of officers of the army, and aided in deposing Richard Cromwell, even venturing, on the credit of his military reputation, to aspire to the position of protector. As a leader of the fifth monarchy men and extreme republicans, he was prominent in procuring the return in May, 1659, of the remnant of the long parliament called the "rump;" and upon the rising of the royalists in Chester in August of the same year he promptly marched thither and defeated them. This success excited the

jealousy of parliament, and on a flimsy pretext Lambert with other officers was cashiered; whereupon with a body of soldiers he dispersed the members, Oct. 13, and a committee of safety appointed by the army, of which Lambert was the controlling spirit, began to exercise the functions of government. His position at this time was so important that it was considered not unlikely, in the event of his own schemes of sovereignty proving impracticable, that he might make terms with Charles II.; and some of the adherents of the latter went so far as to recommend him to secure the services of Lambert by marrying his daughter. Meanwhile Monk commenced his march from Scotland for the purpose of restoring parliament. Lambert at the head of 7,000 men started to oppose him; but his troops deserted in great numbers, and in January, 1660, he was seized by order of parliament, which had reassembled during his absence, and committed to the tower. Monk's design to restore the monarchy being now manifest, the hopes of the republicans began again to centre in Lambert, who, escaping from the tower in April, put himself at the head of a body of troops in Warwickshire. His men again deserted him, and he was recaptured by Col. Ingoldsby and conveyed to the tower. Having been excepted from the bill of indemnity after the restoration, he was tried in 1662 in the court of king's bench with Sir Harry Vane, and convicted, but was relieved at the bar and banished to Guernsey, where he devoted the rest of his life to botany and flower painting. He is said to have died a Roman Catholic.

**LAMBESSA**, or **Lambèse**, a French penal colony of Algeria, in the province and 55 m. S. by W. of the city of Constantine, founded in 1848-'50; pop. of the town about 400, of whom half are Europeans. A French commander resides in the place, and is supported by a body of officers and soldiers. Lambessa contains a church, a hospital, a post office, and various other public buildings, the principal of which is the prison, built at a cost of \$350,000. The prisoners are permitted to work at their former trades; half of the proceeds of their labor is given to them at once, and the remainder when they are set free. The neighboring country is well adapted for agriculture and fruit growing, but is not yet much cultivated.—Lambessa occupies the site of the ancient Lambese or Lambæsa, which was one of the most important cities in the interior of Numidia, belonging to the Massylii. Under the Romans an entire legion was stationed here, and among its interesting ruins are the remains of an amphitheatre, a temple of Æsculapius, a triumphal arch, and other buildings, enclosed by a wall in which 40 gates have been traced, 15 of them still in a good state of preservation. Statues of Jupiter, Æsculapius, and Hygiea, and busts of Roman emperors and empresses have been found, besides a number of tombs and inscriptions. The

population could not have been much less than 50,000. A synod was held there in A. D. 240, attended by 100 prelates. The city was destroyed by the Vandals in the 5th century, and its site was lost; it was discovered in 1844 by the French commandant Delamarre.

**LAMBETH**, a parish and suburb of London,  $1\frac{1}{2}$  m. S. W. of St. Paul's cathedral, on the S. side of the Thames, here crossed by the Waterloo, Charing Cross railway, Westminster, and Vauxhall bridges; pop. in 1871, 379,112. Lambeth palace, the town residence of the archbishop of Canterbury, is situated between Vauxhall and Westminster bridges, opposite the new houses of parliament. This property was acquired by the see in 1197, and has been improved by successive incumbents. The palace stands on a low site close to the river, surrounded by gardens 12 acres in extent. Its objects of interest are the Lollards' tower, founded about 1440; the banqueting hall;

**LAMBRUSCHINI, Luigi**, an Italian prelate, born in Genoa, May 16, 1776, died in Rome, May 12, 1854. He entered in youth the order of Barnabites, and became successively bishop of Sabina, archbishop of Genoa, papal nuncio to France, and in 1831 cardinal. Gregory XVI. appointed him secretary of state for foreign affairs, librarian of the Vatican, grand prior of the order of Malta, and minister of public instruction. On the death of Gregory in 1846, he received on the first ballot for the successor the largest number of votes. Under Pius IX. he became member of the state council, bishop of Porto, and chancellor of the pontifical orders. On the outbreak of the political commotions he fled to Civit  Vecchia, subsequently returned to Rome, fled again in November, 1848, to Naples, and soon after joined the pope at Ga ta. He returned with him to Rome in 1850, and counselled, it is said, milder measures than those adopted by Cardinal Antonelli. He wrote some devotional works and a polemical dissertation on the immaculate conception, all translated and published in France.

**LAMTON**, a S. W. county of Ontario, Canada, bounded N. by Lake Huron and W. by the St. Clair river, and drained by the Sydenham river and other streams; area, 1,083 sq. m.; pop. in 1871, 38,897, of whom 12,673 were of Irish, 11,538 of English, 9,800 of Scotch, and 1,624 of German origin or descent. It contains extensive petroleum wells, and is

traversed by the Grand Trunk and Great Western railways. Capital, Sarnia.

**LAMEGO**, a town of Portugal, in the province of Beira, 71 m. E. N. E. of Coimbra, at the foot of the Sierra Penude, and 3 m. S. of the Douro; pop. about 9,000. It is surrounded by walls, defended by an old castle, and has a fine cathedral, but is otherwise uninteresting and excessively dirty. It contains an episcopal palace, a college, a diocesan seminary, three monasteries, two hospitals, and a nunnery. It has been the seat of a bishop since the 4th century. Its chief celebrity is due to the story that a cortes was held here in 1143, at which the constitution of the newly created kingdom of Portugal was drawn up; but this is now said to be fictitious. Lamego was the residence of the Moorish kings till it was taken from them by Ferdinand the Great in 1038.

**LAMELLIBRANCHIATES**, a name properly given to the acephalous mollusks, having the gills

Lambeth Palace.

the chapel, with a fine roof of carved oak; and the library. Among its many literary treasures and curiosities is a superb Arabic Koran, presented by the governor general of India through Claudius Buchanan in 1805, who calls it "the most valuable Koran of Asia." The library also contains the archiepiscopal registers of the see of Canterbury in regular succession from the year 1278, and the parliamentary surveys of ecclesiastical benefices in the time of the commonwealth, now used as legal evidence. The parish contains many churches, charitable institutions, and other public buildings, some of them elegant and ornamental. Near Vauxhall bridge is the terminus of the Southampton railway. There are many manufactories, and several places of amusement, among them Astley's amphitheatre. In September, 1867, a pan-Anglican synod was held in Lambeth palace, in which several American Protestant Episcopal bishops participated.

in lamellæ on the sides, protected by a right and left shell. Excluding the mollusoids (brachiopods, tunicates, and bryozoans), now believed by many to be articulates, coming near the worms, the term would be synonymous with the bivalve mollusks.

**LAMENNAIS, Hugues Félicité Robert de**, a French author, born in St. Malo, June 19, 1782, died in Paris, Feb. 27, 1854. His father, a wealthy ship owner engaged in commerce, had been ennobled by Louis XVI. He was early abandoned to himself in consequence of the death of his mother and the pecuniary difficulties of his father. He lived almost in solitude, sometimes obtaining assistance in his studies from his elder brother Jean, till about his 12th year, when he was intrusted to the care of his uncle, who confined him day after day in his library. He read Plutarch and Livy, admired Rousseau, and disputed with the parish priest about religion. In his 16th year he retired with his brother to La Chênaie, a residence two leagues from Dinan, where he reduced his studies and various reading to order, mastered Latin, Greek, Hebrew, and several modern languages, and acquainted himself with the church fathers, doctors, historians, and controversialists. He was 22 years old before he made his first communion, and he adopted the ecclesiastical profession only after long hesitation. He made a translation of an ascetic work by Louis de Blois (published in 1809), and published in 1808 *Réflexions sur l'état de l'Église*, his first protest against the reigning philosophical materialism, which was immediately seized and destroyed by the imperial police. He engaged with his brother on the *Tradition de l'Église sur l'institution des évêques* (3 vols., Paris, 1814), in which he confuted the Gallican tenet that the election of bishops is valid without the sanction of the holy see. After being teacher of mathematics in the seminary of St. Malo, founded by his brother, he went in 1814 to Paris, where he lived modestly and unknown. On the return of the Bourbons he published a violent attack upon Napoleon. Judging it prudent to leave France during the hundred days, he took refuge in the island of Guernsey, where he passed several months under the name of Patrick Robertson. He engaged in teaching in London, and for several years after 1815 in Paris. In 1816, at the age of 34, he received sacerdotal ordination, having received the tonsure in 1811; and in 1817 he published the first volume of his *Essai sur l'indifférence en matière de religion*. This was the fruit of constant labor during many years of trial and obscurity, and had an immediate effect throughout Europe. It aimed to oppose to Protestantism and philosophy the principle of ecclesiastical authority and the absolutism of faith. It was received by Catholics with admiration and enthusiasm, and the author became a principal collaborator in the *Conservateur*, a journal founded by Chateaubriand, Villèle, De Bonald, Frayssinous, and others, which was chief-

ly directed against the ministry of Decazes. Though thus ranged among the defenders of the monarchy, he was more earnestly a Catholic than a royalist, and sought in the maintenance of the throne to secure guarantees for the stability of the church. The political hopes cherished concerning him were thus disappointed, and in 1820 he separated from his party with a portion of his colleagues called the "incorruptibles," and vehemently assailed the ministry of Villèle in the *Drapeau Blanc*, and afterward in the monthly *Mémorial Catholique*. The first volume of his *Essai* was suspected of innovating tendencies before the appearance of the second (1820), in which he rejected the Cartesian system, which gives authority to the individual reason, and developed a new theory of intellectual authority founded on the universal agreement of mankind. He maintained that there is a preëstablished harmony between the doctrines of the church and the ideas of the race, that truth is attainable not only from revelation but from universal tradition, and thus sought to make the general consent of men the basis of an alliance between reason and faith. In the last two volumes (1824) he traced the transmission of truth through the ages, collected the scattered traditions of various peoples, and sought to demonstrate that Christianity alone possesses the double character of universality and perpetuity. This work was unanimously and strongly opposed by the Sorbonne and the prelates, and was applauded only by a small body of disciples. He wrote a short defence, and in 1824 went to Rome to present it to the pope. He was coldly received by the cardinals, and Leo XII., who had at one time thought of creating him a cardinal, after conversing with him, declared to his assistants that Lamennais would cause much trouble in the church. On his return, after publishing a translation of the "Imitation of Christ," he produced *De la religion considérée dans ses rapports avec l'ordre civil et catholique* (2 vols., Paris, 1825-'6), in which he strove to establish the absolute spiritual supremacy of the holy see as the solution of the social problem. For this publication he was arraigned before the civil tribunal, and condemned. From this time war was waged between Lamennais and the bishops of France. In his treatise *Des progrès de la révolution et de la guerre contre l'Église* (1829) he first indicated his tendency toward political liberty while laying stress on theocratic absolutism. To combine democracy with the papal supremacy, liberal with Catholic ideas, became his avowed aim immediately after the revolution of 1830. He founded the journal *L'Avenir*, having the motto *Dieu et liberté—le pape et le peuple*, and was assisted by a corps of young and ardent disciples, among whom were Gerbet, De Salinis, Lacordaire, Rohrbacher, De Coux, and Montalembert. It demanded administrative decentralization, extension of the electoral right, freedom of worship, uni-

versal and equal freedom of conscience, freedom of instruction, and the liberty of the press. Encouraged by a portion of the people and of the lower clergy, it was violently opposed by most of the prelates and Jesuits, who denounced it at Rome. While the contest was going on, the editors decided (Nov. 15, 1831) to suspend it for a time, and three of them, Lamennais, Lacordaire, and Montalembert, repaired to Rome to seek the papal approbation. No notice was taken of them on their arrival; Lamennais in vain sought a conference with the pope on the subject of his mission, and after waiting several months decided to return to France. He had gone as far as Munich when he received the encyclical letter, dated Aug. 15, 1832, in which Gregory XVI. formally condemned the doctrines of *L'Avenir*. His principal collaborators yielded at once to the decision; he himself announced that the journal would not again appear. A dogmatic submission was demanded from him, which he finally signed, reserving to himself full liberty in regard to whatever he should believe for the interest of his country and of humanity. He then retired to his patrimonial villa of La Chênaie, and composed, it is said within a week, his *Paroles d'un croyant*, which was not published till 1834, after a year of meditation. From its appearance dates his final and definite rupture with the Roman Catholic church. It was immediately translated into the different European languages, passed through more than 100 editions in a few years, and received the papal condemnation as a book "small in size, but immense in its perversity." In 1836 he published his *Affaires de Rome*, in which he seems to cast a last melancholy look upon the belief which he had abandoned. In the following year he began a journal, *Le Monde*, in the interest of extreme democracy, which survived but a few months. He subsequently produced various political pamphlets, one of which, *Le pays et le gouvernement* (1840), caused his imprisonment for a year in Ste. Pélagie, where he was daily visited by numerous friends. As one of the chiefs and the ablest writer of the republican party, he took part in the revolution of 1848, and after editing the *Peuple Constituant*, a daily newspaper, for four months, was elected by an unusually large vote one of the representatives of Paris in the constituent assembly. He projected a constitution in accordance with his own theories, which was rejected by the committee as too radical. For three years he protested by his silent vote against the course of events. After the *coup d'état* of Dec. 2, 1851, he retired from public life, and was occupied in his last years with translating Dante. At the news of his dangerous illness, priests, and even ladies of the highest rank, sought admission to his chamber to induce him to be reconciled to the church; but by his express prohibition no one was received except those connected with his family. His obsequies were performed amid

an immense concourse of people, and in accordance with a direction in his will his body was borne directly to the cemetery without being taken to any church; and no cross, nor even a stone, marks his grave. He was both one of the ablest defenders and one of the ablest opponents of the papacy in the present century. The constant element in his speculations was an ideal of democracy, which he sought to realize in the first part of his career by allying the people and the pope against the civil monarchy, and in the second part by exalting the people to supremacy in defiance alike of the pope and the civil monarchy. He initiated and gave life to the ultramontane movement, which, after being the object of his most ardent devotion, prevailed in the church of France in spite of his efforts and with his maledictions. Besides the works already mentioned, he published *Esquisse d'une philosophie* (4 vols., 1840-'46). Its system is akin to Neoplatonism, and it traces the rise of all the arts to the plan of the Christian temple. His complete works have been twice collected (12 vols., 1836-'7, and 11 vols., 1844 *et seq.*). Several volumes of posthumous works, including *Correspondance*, were published under the care of Émile Forgues (1856 *et seq.*).

**LA METTRIE, Julien Offray de**, a French physician and philosopher, born in St. Malo, Dec. 25, 1709, died in Berlin, Nov. 11, 1751. He was the son of a rich merchant, received a liberal education, and was destined for the church, but preferred to devote himself to medicine. In 1733 he went to Leyden, where he placed himself under the direction of Boerhaave, several of whose works he translated into French. In 1742 he went to Paris, and was appointed physician to the *gardes françaises*, followed that regiment into Germany, and witnessed the battles of Dettingen and Fontenoy. In 1745 he published his *Histoire naturelle de l'âme*, in which he denied the immateriality of the human soul. In consequence of this he lost his office, and the following year, having issued his *Politique du médecin de Machiavel, ou le Chemin de la fortune ouvert aux médecins*, a libellous attack upon his medical colleagues, he was obliged to fly to Holland. There he wrote and printed his noted atheistical work, *L'Homme-machine* (12mo, Leyden, 1748), which was publicly burned by order of the authorities. Expelled from Holland, he was invited to Berlin by Frederick the Great, who made him his reader and a member of his academy. He lived on terms of familiarity with the king, and published several works of a similar tendency to his previous writings; among them were *L'Homme-plante* (Potsdam, 1748), *Réflexions sur l'origine des animaux* (Berlin, 1750), and *Vénus métaphysique, ou Essai sur l'origine de l'âme humaine* (Berlin, 1752). He died of indigestion, caused by high living. Frederick wrote his eulogy. Several editions of his philosophical works have been published; the most complete in Berlin, 1796.

**LAMMAS DAY**, in the calendar, the first day of August, so called perhaps from the custom which formerly prevailed among the tenants who held lands of the cathedral church in York, England, of bringing a live lamb into the church at high mass on that day. Some antiquaries derive the term from a Saxon word signifying loaf mass or bread mass, which was a feast of thanksgiving to God for the first fruits of the harvest. It is said to have been even recently a custom for tenants to bring in new wheat to their lord on or before that day. In the Salisbury manuals of the 15th century it is called *benedictio novorum fructuum*, and on this day before the reformation Peter's pence were paid in England. Dr. Johnson thinks it is a corruption of "latter math," meaning a second mowing of the grass. Valancey, in his *Collectanea de Rebus Hibernicis*, mentions that the 1st of August, Laithmas (pronounced La-ee-mas), was celebrated by the druids as the day of the oblation of grain. The proverb "at latter Lammas" is a euphemism for "never."

**LAMMERGEYER** (Germ. *Lämmer*, lambs, and *Geier*, vulture), or **BEARDED VULTURE** (*Gypæ-*

of the head, the neck, and the under parts are whitish tinged with orange, deepest on the breast; the wings and tail are grayish black, the wing coverts dashed with orange white; the back deep brown; the beard and space including the eye and cere black; bill horn-colored. There is only one well characterized species, which inhabits the mountains of Europe, Asia, and northern Africa, especially the Alps and Pyrenees. Lammergeyers are seen usually in pairs; they feed on lambs, goats, chamois, &c., which they attack in such a manner as to cause them to leap over precipices, when they descend and devour the mangled carcasses; they also eat carrion. The nest is made upon inaccessible rocks, rarely upon lofty trees, several feet in diameter and of coarse materials, and the number of eggs is two or three. This bird plays the same part in the old world as the condor does in the new, and is very destructive to the flocks of the Alpine valleys; stories are numerous, though not well authenticated, of its having carried off children. It is not abundant anywhere, and is rarely seen in Europe north of Germany. The African bird (*G. meridionalis*, Brehm) and the Asiatic (*G. Himalayanus*, Hutt.) are probably only varieties of the bearded vulture.

**LAMOILLE**, a N. county of Vermont, drained by Lamoille river; area, 420 sq. m.; pop. in 1870, 12,448. The surface is hilly, the Green mountains traversing the county in a N. E. and S. W. direction. There is some excellent soil in the valleys, but the land is chiefly adapted to grazing. The chief productions in 1870 were 18,257 bushels of wheat, 61,836 of Indian corn, 168,103 of oats, 333,185 of potatoes, 50,022 lbs. of wool, 68,233 of hops, 657,892 of maple sugar, 984,378 of butter, 39,199 of cheese, and 41,570 tons of hay. There were 2,703 horses, 8,886 milch cows, 1,375 working oxen, 4,701 other cattle, 9,377 sheep, and 2,480 swine; 8 manufactories of carriages, 1 of hones and whetstones, 1 of paper boxes, 10 of starch, 3 of tin, copper, and sheet-iron ware, 1 of woollen goods, 2 tanneries, and 9 saw mills. Capital, Hyde Park.

**LAMORICIÈRE**, Christophe Louis Léon Juchault de, a French general, born in Nantes, Feb. 6, 1806, died near Amiens, Sept. 10, 1865. He was educated at the polytechnic school of Paris, and at the academy for military engineers of Metz, on leaving which he joined the Algerian army and entered the corps of Zouaves at the time of its formation (November, 1830). He was placed in 1833 at the head of the office (*bureau arabe*) organized by Gen. Avizard for facilitating the relations with the native population. He took an active part in the capture of Constantine. In 1839 he was recalled to Paris, but returned in 1840, and gained distinction at Mouzaïa, in the Mascara expedition, and at Isly. The celebrity of the Zouaves was chiefly due to him. In November, 1845, on the departure of Gen. Bugeaud, he became provisional governor general of Al-

Lammergeyer (*Gypætus barbatus*).

*tus barbatus*, Cuv.), the largest of European birds of prey. It is about 4 ft. long and 9 or 10 ft. in extent of wings; the head and neck are completely clothed with feathers, and the cere is entirely hidden by projecting bristles; the bill is long and strong, straight, laterally compressed, with the tip curved and sharp; a tuft of stiff bristles projects forward like a beard from the base of the lower mandible; the wings are long, the second and third quills nearly equal and longest; tail lengthened and wedge-shaped; tarsi short and covered with feathers; toes moderate, the anterior ones united at the base by a membrane; claws curved, especially those of the inner and hind toes, and not well adapted for seizing and destroying prey. In the adult, the upper part

geria, but went to France in 1846, in the hope of exerting a favorable influence upon the destiny of the African colony by taking part in the parliamentary discussions on the subject. He was elected to the chamber in October, 1846. Returning to Algeria soon after, he organized the expedition against Abd-el-Kader which finished the war. He made altogether 18 African campaigns, and rose to the rank of lieutenant general. He was reelected to the chamber of deputies in 1847, and when the revolution of February, 1848, broke out, he exerted himself in favor of the formation of a new administration under Louis Philippe, and as colonel of the national guard went among the people assembled on the boulevards to allay the public excitement. But he was not listened to, and after the abdication of Louis Philippe he was slightly wounded while on his way to the Palais Royal to proclaim the regency of the duchess of Orleans. On the same evening he tendered his allegiance to the provisional government. He took his seat in the constituent assembly as a member for Sarthe, and became prominent in the committee on military affairs. During the bloody days of June, 1848, three horses were killed under him. He officiated as Gen. Cavaignac's minister of war until December, 1848, and was instrumental in introducing various measures for the benefit of Algeria. He strenuously opposed the election of Louis Napoleon to the presidency, and even questioned his right to citizenship. Being elected to the legislative assembly, he became president of the constitutional committee, and opposed the projects of the ultra-radical party. In the course of the Hungarian struggle with Austria, he was intrusted with a diplomatic mission to Russia; but on his arrival there the Hungarians had already been crushed by the armed interference of the czar. On hearing of the overthrow of Odilon Barrot's administration (Oct. 31, 1849), he returned to France and resumed his seat in the legislative assembly. After the *coup d'état* of Dec. 2, 1851, he was arrested and detained in the fortress of Ham until Jan. 9, 1852, when he was permitted to go to Prussia. A letter of his, refusing to recognize the government of Louis Napoleon, was published in May, 1852. He afterward resided in Germany, Belgium, and England. In 1857, on the sudden death of one of his children, he was allowed to return to France; and with the consent of the French government in April, 1860, he was appointed by Pope Pius IX. commander-in-chief of the papal troops, mainly foreigners. The Sardinian government, completing the work begun by Garibaldi in the Neapolitan provinces, sent Gens. Cialdini and Fanti into Roman territory; they took Perugia, annihilated Lamoricière's army at Castel Fidardo, Sept. 18, besieged him in Ancona, and compelled a capitulation, Sept. 29. He published an extended report of his last campaign.

**LA MOTTE-FOUQUÉ.** See **FOUQUÉ.**

**LAMOTTE-VALOIS, Jeanne de Luz de St. Remy,** countess de, a French adventuress, born in Champagne about 1756, died in London, Aug. 23, 1791. After marrying a count de Lamotte, who was a spendthrift, she went to Paris, and succeeded in being introduced to Marie Antoinette, who took some interest in her, and to Cardinal de Rohan, grand almoner to the king. She persuaded the latter that she could conciliate for him the affection of the queen, who she told him was desirous of getting a magnificent diamond necklace, then in the hands of the court jewellers, which was worth about 1,600,000 francs. She induced a Mlle. d'Oliva who resembled Marie Antoinette, to personate her at a midnight interview with Rohan in the gardens of Versailles. With the real signature of Rohan and a forged one of the queen, the countess got possession of the necklace (Feb. 2, 1786), which she sold in London, but pretended that she had delivered it to the queen, and for several months concealed the robbery by producing forged notes apparently written by the latter. Finally a direct application of the jewellers to her majesty awoke suspicion, which resulted in a public trial before the parliament. All France was excited over the affair. The cardinal was discharged from all accusation, while the countess was sentenced to be whipped, branded on the shoulder, and imprisoned for life. After being incarcerated about two years at the Salpêtrière, she escaped, June 5, 1787, and fled to London, where she published libels against the queen. Her husband survived her, and twice wrote a complete history of the affair; the first manuscript was taken from him by the French police; the second was mutilated in its most important parts. This mutilated manuscript was printed in 1858, under the supervision of L. Lacour, with the title *Affaire du collier: Mémoires inédits du comte de Lamotte-Valois*. The best account of the affair is to be found in Louis Blanc's *Histoire de la révolution française*.

**LAMOURE,** an E. central county of Dakota territory, recently formed and not included in the census of 1870; area, about 1,800 sq. m. It is intersected by the Dakota or James river.

**LAMP,** a vessel employed for producing light, and sometimes also heat, by the combustion of inflammable fluids, grease, or wax. The simple form of these contrivances adopted by the ancient Hebrews has continued in use down to the present day; and until near the close of the last century this had hardly been improved upon among the most civilized nations. Even on the American continent may still be seen among the Canadian French the same low oval metallic vessel that was used by the ancient orientals and Europeans, furnished with a handle at one end and a beak at the other, through a hole on the upper surface of which projects the wick from the reservoir of oil or grease below. Some are made to be carried in the hand and placed upon tables, and others are kept suspended by chains in the middle of

rooms. They give a dim smoky light, in consequence of the carbonaceous matter not being sufficiently spread by an open wick to be reached by the oxygen of the air before it is dissipated in sooty vapor. (See COMBUSTION, and FLAME.) The external form of the lamp was more of a study to the ancients than the principles of combustion. They gave to it the most graceful outlines, and ornamented it with grotesque figures and fanciful designs which were often of great beauty. They suspended their lamps from the ceiling or from the hands of ornamental figures of boys or men, or they were placed upon stands. As at the present day in Aleppo and Egypt, they were kept by the Hebrews burning all night; and to this much importance was attached, the putting out of the light being significant of the extinction of the family and desertion of the house.—The first improvement in the construction of lamps was removing the beak by a long neck to a distance from the reservoir of oil, thus reducing the width of the shadow cast by the lamp. Besides this object, it was soon found by those who investigated the matter, that the following were subjects for improvement: 1, the wick, which as used presented a bundle of fibres, the inner portion of which, though saturated with oil, was removed from the reach of the air required for its combustion; 2, the level of the surface of the oil, that from first to last it should bear the same relation to the level of the burning part of the wick, thus securing uniformity in the supply of oil for combustion; and 3, the concentration of the light by reflectors at points where it is wanted. The wick was first improved and much used in the countries bordering on the Rhine by plating its fibres together to make it flat and ribbonlike; a flat socket was provided for it, and it was made to move up and down by a horizontal spindle and toothed wheel; this is known as the Worms lamp. A greater improvement was that of the Argand burner, in which the wick was made in the form of a hollow cylinder, and so arranged that a current of air could pass up within it, as well as come to its external surface. The addition of a chimney of sheet iron, as originally made by Argand, increased the supply of air by producing an upward draught. The effect of the chimney was afterward much increased by contracting its upper portion and forming a shoulder, against which the ascending current impinges, and is turned inward upon the flame. The so-called astral lamps were provided with these wicks, and the reservoir for the oil was arranged in the form of a hollow ring encircling the hollow central stand that supported the burner, and with which it was connected by one of the tubular braces that held it up. Thus the level of the oil in the shallow ring could not undergo much change, and it continued very nearly the same as that of the burning part of the wick until it was almost exhausted. In consequence of the thin and peculiar shape

given to the ring, the lamp cast no shadow at a little distance off, and a vase of ground glass surrounding the flame served to render the light still more diffusive or scattered. In the year 1800 Carcel devised an ingenious piece of clockwork machinery for pumping the oil from a reservoir at the foot of the lamp up to the burner, and thus supplying this always from the same point, while the excess of oil flowed back into the reservoir. This being at the base of the stand and the flame at the top, there was consequently no shadow. The lamp, afterward slightly improved by other manufacturers, was in many respects the most perfect of these contrivances; but its great cost restricted its use to the wealthy. It was moreover so inconveniently large and heavy, that it could be moved only with difficulty; and the complicated nature of its mechanism required access to skilful workmen, such as can be found only in large cities, to keep it in repair. The attention directed in the early part of the present century to the subject of producing artificial light by convenient and efficient methods caused many more forms of lamps to be introduced than can here be named. Some were designed to burn the crude whale oil, which on account of its viscosity requires to be heated before it can pass along the fibres of the wick. Parker's hot oil or economic lamp was especially adapted for its use. The reservoir was a double cylinder of metal surrounding the upper portion of the chimney, which was also of metal, the lower part being of glass. It was supported by a side arm, which was made hollow to convey the oil to the burner below. A paper shade served to conceal the apparatus above the flame, and also to reflect the light downward. This lamp is very highly commended by Dr. Ure for its illuminating power and economy. The lamps of Benkler, constructed in Wiesbaden in 1840, introduced a peculiar contrivance in the form of the burner, which caused the draught of air to impinge at an angle upon the flame, making the combustion more vivid and the light more brilliant. It rendered practicable the use of poor qualities of oil, such as in other lamps were very imperfectly consumed, and only with the production of much smoke and disagreeable smell. The so-called solar lamps, first made by Mr. Smith in Birmingham, depended on this principle; and it was essential to the excellent solar lamps made by Cornelius of Philadelphia, which, by means of a metallic cylinder passing from the burner down into the reservoir, permitted the use of lard instead of oil, sufficient heat being conveyed from the flame to keep it in a melted state. The solar lamps, on account of the cheap materials they consume, have been very extensively used; but they require particular care to keep them clean. The wick must be frequently changed, and always freshly trimmed with every using; and the reservoir also must be freshly filled at the same time. A re-

port of comparative experiments made in 1844 for the United States treasury department with the solar lard lamp, an Argand burner for rosin gas, and an Argand oil lamp such as was used in the lighthouses, by Prof. Walter R. Johnson and others, is contained in "Senate Document No. 166," 28th congress, second session. The results are also given in the American edition of Knapp's "Chemical Technology" (1848), vol. i., p. 212. The results of the comparative trials referred to were, that from the same weights of the materials employed the quantity of light afforded by lard was represented by the figures 1068; by rosin gas, of specific gravity 0.8093, "or 43 per cent. superior in density to coal gas," by 956; and by sperm oil (two thirds summer and one third winter strained) by 711.—The forms of lamps so far noticed are not adapted for being carried about in the hand, and their advantageous qualities depend on their being employed for several persons together. Little progress has been made in the production of economical, safe, and convenient small lamps. The vapor lamps, made for burning the vapors arising from a mixture of oil of turpentine and alcohol, which is kept sufficiently heated by a metallic tube passing down into the mixture from the flame, promised to meet this want; but they proved expensive in use, and not altogether free from danger and the offensive smoke and smell of burning turpentine. Similar lamps were made for burning the volatile hydrocarbons obtained from the products of the distillation of bituminous coals. To these succeeded a variety of lamps for the burning of camphene, and of a mixture of camphene and alcohol called burning fluid, but which, together with the material, have passed out of use, as being unsafe. The oils obtained by distillation of bituminous coals and petroleum have introduced new forms of lamps called kerosene lamps, and it is believed that these present all the advantages of cheapness, portability, and brilliancy of light that distinguished the camphene lamps, while their entire safety gives to them a preference which has caused the use of the latter to be wholly abandoned. A multitude of burners have been contrived for these lamps, all made with reference to effecting the most thorough combustion of the oil. One of these in very general use has a flat wick half an inch to two inches broad, which is moved up and down by a horizontal spindle. The wick tube is held by a cap which screws upon the top of the lamp, and over the cap is fitted tightly a brass ring or cylindrical piece perforated all around with holes to let in air to the wick; and this ring carries a dome-shaped cover of thin brass in the top of which is a slit or elongated opening a little larger than the wick and directly over it, through which the flame passes up. The dome being of smaller diameter than the ring, there is room outside of it for the base of a glass chimney to stand, and this is more over

supported outside by the extension upward of the brass cylinder. Another row of holes perforated at the base of this extension lets in air, which passes under the foot of the glass, and circulates up the outside of the dome, meeting the flame at the top. The dome with its opening is somewhat like the peculiar arrangement in the solar lamp. The chimney is enlarged immediately above the flame, and is then contracted to the same diameter as below. The student lamp, used for burning kerosene, has a construction similar to the Argand lamp, and is supplied with a reservoir which keeps the wick full at nearly a constant level.—Lamps in chemical operations answer the purpose of small furnaces. They are made in a great variety of forms, adapted to special uses and the kinds of fuel employed. Some are oil lamps designed for the use of the blowpipe, and are furnished with a broad flat wick convenient for this purpose. Others are designed to consume alcohol; and these are either plain vessels, commonly of glass, furnished with a metallic tube for holding the wick and a closely fitting bell-shaped cover of glass for protecting the alcohol from evaporation when the lamp is not in use; or they are more elaborately constructed of metal, provided with an Argand burner, and made to slide upon an upright rod. This rod also supports movable rings adapted for holding crucibles and other vessels over the flame of the lamp. The heat is concentrated by the use of a metallic chimney; and in some lamps it can be intensified by propelling a current of air of annular form and concentric with the Argand burner, so directed as to impinge across the flame.—*Safety Lamps.* The explosive mixture of light carburetted hydrogen and atmospheric air which is often present in coal mines long made it desirable to procure some kind of device by which the ignition of the compound might be avoided. Contrivances called steel mills were first used to give light in dangerous parts of the mines, a succession of sparks being constantly elicited by the rapid revolution of little wheels of steel against pieces of flint. In an explosive mixture of gas and air these however were not safe, as the sparks were liable to produce explosion. Their greatly increased brilliancy in this served to indicate danger; and where the gas predominated above the explosive proportion the sparks were of blood-red color or ceased entirely to be emitted. The necessity of more efficient protection led to the invention in 1813, by Dr. W. R. Clanny of Sunderland, England, of the first true safety lamp. In this the communication with the external air was intercepted by water, through which the air was made to pass. This apparatus proved too cumbersome for general use. In 1815 George Stephenson and Sir Humphry Davy both invented safety lamps on other principles. The former, noticing the effect of the gaseous products of combustion to extinguish the burning jets of inflammable gas called blowers, which issue from the crevices of coal

mines, contrived a lamp which was protected by a glass cylinder, and covered at top with a perforated metallic cap to allow the products of combustion to pass out. The air to support combustion was admitted through small openings in the bottom, and it was supposed that the velocity of the current entering the lamp would prevent the explosion passing backward; but the protection the lamp afforded was really owing to the smallness of the apertures, continued through capillary tubes till they discharged all around and close against the circular burner. Davy's lamp is represented in fig. 1. The wire-gauze cylinder, through which the air was admitted, served also for the passage of the light, and when composed of wire  $\frac{1}{60}$  to  $\frac{1}{40}$  of an inch in diameter, and with 28 wires or 784 apertures to the inch, proved a perfect obstruction to the flame in the most explosive mixtures, unless these were blown in currents through the gauze, or the lamp was carried rapidly through the gas. The wires might even be heated red hot, as sometimes happens in very foul air, by the flame leaving the wick and burning in the upper part of the cylinder, and no explosion take place; but if a glass cover became hot it might be broken by drops of water falling upon it; and so fragile a material under any circumstances could not be regarded as a sure protection. Among the various modifications of the Davy lamp, that

FIG. 1.—Davy's Safety Lamp.

FIG. 2.—Mackworth's Safety Lamp.

known as Mackworth's safety lamp, which was contrived by one of the government inspectors of coal mines to meet the objections raised in resisting the general introduction of the Davy lamp into the fire-damp mines, is represented in fig. 2. The objections were the small light given by the Davy, which is an inconvenience in working high seams of coal; that its locks could be easily picked and opened by the workmen to obtain more light, or to light their pipes; and also the danger of breaking the glass

already mentioned. The lamp has a thick outer glass, *a a*, and a thin inner chimney, *f b*. The air supplies the flame in the direction of the arrows through three wire gauzes: first the cylindrical gauze *c*; then through the gauze *d*, which supports the brass cover *e* of the glass chimney *b*; and thirdly

through the conical wire gauze *f*, which with its frame acts as a support to the glass chimney *b*. This conical frame throws the air on to the flame *g* so as to produce a more perfect combustion and a white light. This lamp burns with a steady flame in currents of air which extinguish other lamps. It is  $1\frac{1}{2}$  lb. heavier than the Davy, and  $1\frac{1}{2}$  lb. lighter than the Clanny lamp. The outside glass does not get so hot as in the latter, and if it breaks, there is still a perfect safety lamp inside.

**LAMPASAS**, a central county of Texas, bounded W. by the Colorado river and drained by the Lampasas, a tributary of the Leon; area, 835 sq. m.; pop. in 1870, 1,344, of whom 86 were colored. The surface is much broken, and the soil is fertile; much of the land is well adapted to grazing. There are white sulphur springs at the county seat. The chief productions in 1870 were 45,487 bushels of Indian corn and 26 bales of cotton. There were 713 horses, 20,787 cattle, 1,241 sheep, and 4,320 swine. Capital, Lampasas.

**LAMPBLACK**, finely divided carbon, obtained by collecting the smoke produced in burning oils, fats, and resins, with a supply of air sufficiently reduced to prevent perfect combustion; the aim being to consume all the constituents

Lampblack Apparatus

of the burning body except the carbon, and preserve as much of that as possible. Lampblack is prepared in large quantities by the manufacturers of turpentine, from the impure resin and other refuse matters that remain after the distillation of the turpentine. These

are burned in iron pots or furnaces with very limited access of air. The dense smoke produced by the combustion is conveyed into chambers hung with sacking, upon the surface of which the lampblack is deposited. It is scraped or shaken off from time to time, and sent to market without further preparation. The illustration shows the arrangement of the apparatus generally used. A cylindrical brick chamber 10 or 15 ft. in diameter, with a conical roof, has a small opening at the top to maintain a sufficient draught to cause the clouds of smoke to ascend toward the upper part of the chamber. A cone of sheet iron hangs within the cylinder, having a small hole in its apex, through which the gases pass upward. At the side and base of the chamber is a kind of furnace, above the fire in which is placed a pan containing resinous or fatty matters, which are heated to a point sufficient to convert them into vapor, and then the vapor undergoes sufficient combustion to be deprived of its hydrogen, while most of the carbon is unconsumed. The smoke ascends into the chamber, and is mostly deposited upon the hanging canvas or sacking, and upon the inner surface of the iron cone, from which it falls after a certain thickness is collected. The cone is so held by a chain and pulley that it may be lowered, which operation scrapes the lampblack off the sacking. The lampblack thus prepared is not pure charcoal, as it is mingled with resinous and bituminous substances, with ammoniacal and other matters. By heating it to redness in a vessel permitting no access of air, the impurities are driven off, and an almost pure impalpable charcoal powder remains. Other kinds of black are used in the arts, such as Spanish black, which is made from cork; vine black, made from vine tendrils; and peach black, made from peach kernels, which has a bluish color. German or Frankfort black, used in making copperplate ink, is said to be made by carbonizing a mixture of grape and wine lees, peach kernels, and bone shavings.

**LAMPREY**, a cyclostome or marsipobranch fish of the family *petromyzonidae* (*hyperoartia*, Müller), and genus *petromyzon* (Linn.). This order, with the myxinoidea, constitutes the class of myzonts of Agassiz. The blood is red, the heart distinct, the branchial artery without a bulb and furnished at the base with two valves; the body smooth, cylindrical, and vermiform; mouth anterior, gills fixed, and eyes distinct; the single olfactory cavity opens above by an external foramen, leading to a blind canal not communicating with the mouth through a perforated palate as in the myxinoidea; thorax cartilaginous, sustaining the branchial apparatus composed of rib-like strips descending on each side beneath the skin, with seven external spiracles, opening from the fauces into a sub-oesophageal tube, having a posterior caecal extremity. These are the first fishes in which there is a distinct brain enclosed in a cartilaginous cranium; there are two dorsal fins, the

posterior joined with the caudal, and mere folds of skin with scarcely perceptible rudimentary rays; pectorals and ventrals absent; the cephalic cartilage is undivided; there is a spout hole on the head, and a spiral valve in the intestine; there is no oviduct nor seminal duct. The jaws are absent, but the circular mouth, tongue, and pharynx are armed with conical or crescentic sharp teeth of indurated albumen. The gills are seven little fixed bags, each having its proper artery, its opening into the sub-oesophageal tube, and its external foramen by which the water passes out.—The old genus *petromyzon* has been subdivided into six, according to the shape and arrangement of the teeth. The common European lamprey, or lamprey eel as it is often called (*P. marinus*, Linn.), attains a length of more than 3 ft.; the color is yellowish marbled with brown. Having no air bladder and being destitute of lateral fins, they are usually found near the bottom, and to avoid being carried away by the currents they attach themselves to stones by means of the tongue, which acts like a sucking piston in the circular mouth, whence the names of *petromyzon* and cyclostomes; in the same manner they attach themselves to larger fishes, which they devour; by means of the apparatus above described, respiration may be carried on independently of the mouth, the branchial currents passing from one series of openings to the other across the sub-oesophageal tube. The intestine is small and nearly straight; the eggs are laid late in the spring, the milt and roe escaping by a membranous sheath communicating with the abdominal cavity. They ascend rivers from the sea to spawn. They are very generally distributed in Europe from the Mediterranean to the arctic waters, ascending the rivers in spring; at this season great numbers are caught, their flesh being considered a delicacy. The food of the lamprey consists of any soft animal matter, especially the flesh of fishes to which they attach themselves. The river lamprey or lampern (*P. fluviatilis*, Linn.) is a smaller fish, and confined to fresh or brackish water; the length is from 12 to 18 in., and the color bluish olive above and silvery below. Great numbers were formerly caught in the Thames, Severn, &c., and sold to the Dutch for bait in the turbot fishery. This and the preceding species are very tenacious of life, living several days out of water.—The most common of the American species is the *P. Americanus* (Lesueur), growing about 2½ ft. long; the color is olive brown above, with blackish brown confluent patches, and beneath uniform dull brown. This is not uncommon in the rivers of New England and New York, especially near their mouths; it likes best shallow rapid streams with pebbly bottoms, in which it builds circular nests 3 or 4 ft. in diameter and a foot or two high, bringing stones in the mouth varying from the size of a hen's egg to that of the fist. They ascend high falls by clinging to the rocks, after suddenly dart-

ing forward; though uncommon in rivers obstructed by dams, they are abundant at their outlets, especially in the Merrimack near Lowell. Several other species are described in Dr.

Lamprey (*Petromyzon Americanus*).

Storer's "Synopsis of the Fishes of North America."—The genus *ammocetes* (Duméril) has the same cylindrical body, branchial apertures, and fins as the lampreys; the mouth is semicircular, without teeth, the posterior lip transverse and serrated within; the branchial apertures open internally into the oesophagus itself; the incomplete circle of the mouth prevents its adhering to rocks and other bodies; the external branchial openings are placed in a longitudinal furrow. It is often called mud lamprey, from its being found in the mud and sand. The best known species in Europe is *A. branchialis* (Cuv.), 6 or 7 in. long, about as thick as a goose quill, generally of a yellowish brown color above, darker on the head and back, lighter beneath; the eyes are very small; it spawns at the end of April, and feeds upon worms, insects, and dead matter, living in fresh water in many countries of Europe. Dr. Storer describes three species as occurring in North America, the *A. bicolor* (Lesueur), *A. concolor* (Kirtland), and *A. unicolor* (De Kay). From its resemblance to the lamprey, *ammocetes* was called *petromyzon* by the early writers. Aug. Müller (in his *Archiv*, 1856) maintains that *ammocetes* is the larval form of *petromyzon*, and does not attain the perfect state until the fourth year from the egg; subsequent observations confirm this view, which, if true, is a remarkable instance of partial metamorphosis in fish, and shows upon what transitory characters genera may be founded. According to Van der Hoeven, the cleavage of the yolk is entire, and in the first stage of development there is much analogy with that of the frog.

**LAMP SACUS**, an ancient Greek city of Mysia in Asia Minor, situated on the Hellespont near where it expands into the Propontis. Its original name was Pityusa, but it was colonized at an early period by Ionians from Phocæa and Miletus, who called the place Lampsacus. It had an excellent harbor, and acquired extensive commerce. Miltiades, son of Cypselus, who had established himself in the Thracian Cher-

sonese, made war on the Lampsacenes, but was surprised and taken prisoner by them. Croesus espousing his cause, they restored him to freedom. After the rise of the Persian power, Lampsacus became subject to it. On the overthrow of the Persians at Mycale (479 B. C.), Lampsacus joined the Athenian confederacy, but it revolted when intelligence arrived of the destruction of the Athenian armament and army in Sicily (413). It was reduced by Strobichides, and remained dependent on Athens till the time of Alexander, when it was absorbed in the Macedonian, and subsequently in the Roman dominions. In the age of Strabo it was still a place of importance. Charon the historian, Anaximenes the rhetorician, and Metrodorus the philosopher, were natives of Lampsacus, which was also a chief seat of the worship of Priapus. Its territory was famous for wine. The name of Lampsacus is still preserved in that of Lapsaki, a small village 5 m. S. of Gallipoli, near the probable site of the ancient city, of which no trace now remains.

**LAMP SHELL.** See BRACHIOPODA.

**LANARK**, the county town of Lanarkshire, Scotland, on the river Clyde, 656 ft. above the sea, 23 m. S. E. of Glasgow, and 31 S. W. of Edinburgh; pop. in 1871, 5,099. It consists of one main and several smaller streets, is paved and supplied with gas and water, and has six churches and various public institutions. Its inhabitants are employed chiefly in hand-loom weaving for the Glasgow and Paisley manufacturers. Shoes are also made. There are several breweries and flour mills.—About 1 m. S. is the manufacturing village of NEW LANARK, on the Clyde; pop. about 1,700. This village owes its origin to David Dale, who erected a cotton factory there in 1784. He was succeeded in the management by his son-in-law, Robert Owen, who in 1815 attempted an economical experiment among the workpeople. They numbered about 2,500, and were under his control till 1827, when he retired from the management of the works. The establishment was not successful, and no trace of its peculiar features now remains.

**LANARK**, a N. E. county of Ontario, Canada; area, 1,197 sq. m.; pop. in 1871, 33,020, of whom 16,507 were of Irish, 11,873 of Scotch, and 3,220 of English origin or descent. It is watered by the Mississippi river, an affluent of the Ottawa, by the Rideau, and by several small lakes, and is traversed by the Brockville and Ottawa railway. Capital, Perth.

**LANARKSHIRE**, or **Clydesdale**, an inland county of Scotland, bordering on the counties of Dumbarton, Stirling, Linlithgow, Edinburgh, Peebles, Dumfries, Ayr, and Renfrew; area, 888 sq. m.; pop. in 1871, 769,339. The river Clyde traverses the county from S. S. E. to N. N. W., and with its tributaries is noted for beautiful river scenery. The falls of Bonnington, Corra Linn, and Stonebyres are much visited by lovers of the picturesque. The county is nominally divided into three wards,

the upper or south ward, the middle, and the lower or north ward, the last containing the city of Glasgow; the upper is mountainous, the middle hilly, and the lower level. The Lowther hills, along the south, are from 2,000 to 3,000 ft. high, but afford extensive ranges of pasturage. In these hills are valuable lead mines, consisting of four principal veins 4 to 10 ft. thick, one of which has been wrought to a depth of 140 fathoms, the pure ore in one place having been found 14 ft. wide. Coal is however the most important of the mineral treasures of the county, the fields comprising 55,000 acres. There are also important iron mines and immense fields of fire clay. Dairy husbandry is carried on with great success. Oats are the principal grain crop, but wheat and barley are extensively grown. Clydesdale is noted for its orchards, as well as for its breed of draught horses. It is the seat of vast manufacturing industry in collieries, iron works, and cotton, flax, silk, and woollen. In the time of James III. of Scotland gold was found in Lanarkshire, from which coins were struck called unicorns. Capital, Lanark.

**LANCASHIRE**, or **Lancaster**, a N. W. county of England, bordering on Cumberland, Westmoreland, Yorkshire, Cheshire, and the Irish sea; area, 1,905 sq. m.; pop. in 1871, 2,819,495. The surface is nearly level, except in the north and east. The long ridge known as the "backbone of England" separates the county from Yorkshire on the east, and the N. district is broken by Conistone Fells (2,577 ft. high) and other considerable eminences. The Duddon, Lune, Wyre, Ribble, Mersey, and Irwell are the principal rivers. The coast is deeply indented by bays and arms of the sea, of which Morecambe bay and the estuary of the Ribble are the most important. Morecambe bay and a part of Westmoreland detach the most northern part from the rest of the county. The prevailing geological formations are limestone and carboniferous and new red sandstone. The Lancashire coal field covers 400 sq. m. of the south and southwest of the county, thus underlying the whole of the manufacturing districts, and extending into Cheshire and North Wales on the one side, while on the other it is separated by but a brief interval from the coal fields of Yorkshire. Copper, iron, and lead are also found. Peat mosses form a remarkable feature of the surface. The principal of these swamps was formerly Chatmoss, about 5 m. long, once considered irclaimable, but now mostly under cultivation. The climate is humid, but temperate, and the soil moderately fertile. Dairy and hay farms are numerous, and potatoes are more extensively grown than in any other English county. Lancashire owes its importance chiefly to its manufactures and commerce. The most important manufactures are cotton, woollens, worsted, flax, and silk goods, hats, paper, and soap. The manufacturing districts are traversed by a large number of canals and rail-

ways, and include the towns of Manchester, Bolton, Preston, Blackburn, Oldham, Ashton, Stockport, Bury, Chorley, Wigan, and Rochdale. Capital, Lancaster; chief commercial city, Liverpool.—Lancashire was made a county palatine by Edward III. Riots took place in many parts of the county in 1826 for the destruction of power looms. It suffered greatly from the cotton famine during the American civil war; in January, 1863, there were 228,992 operatives unemployed, and £1,864,121 was contributed for their relief. The duchy of Lancaster is annexed to the crown, and its net revenue is paid into the sovereign's privy purse. The receipts in 1870 were £53,868, and the expenditures £15,136.

**LANCASTER**. I. A S. E. county of Pennsylvania, bounded S. W. by the Susquehanna river and S. E. by Octorara creek; area, 928 sq. m.; pop. in 1870, 121,340. The surface is uneven, South mountain extending along the N. W. frontier, and Mine ridge passing through the S. E. part. The surface between these mountains is undulating and traversed by many small streams. Blue limestone, roofing slate, marble, chrome, and magnesia are found in the county. The soil is a rich calcareous loam. The Reading and Columbia and the Pennsylvania Central railroads pass through it. The chief productions in 1870 were 2,077,413 bushels of wheat, 88,245 of rye, 2,820,825 of Indian corn, 1,943,577 of oats, 419,755 of Irish and 33,821 of sweet potatoes, 2,692,584 lbs. of tobacco, 20,092 of wool, 2,462,376 of butter, 82,614 of cheese, and 124,185 tons of hay. There were 21,409 horses, 2,504 mules and asses, 31,368 milch cows, 1,142 working oxen, 32,249 other cattle, 11,821 sheep, and 50,070 swine; 1,616 manufacturing establishments, having an aggregate capital of \$9,504,162, and an annual product of \$14,034,180. The most important were 24 manufactories of agricultural implements, 31 of brick, 90 of carriages, 9 of cotton goods, 13 of woollens, 32 of iron in various forms, 45 of lime, 13 of machinery, 2 of printing paper, 6 of patent medicines, 47 of saddlery and harness, 44 of tin, copper, and sheet-iron ware, 143 flour mills, 26 tanneries, 18 currying establishments, 12 breweries, 5 planing mills, and 11 saw mills. Capital, Lancaster. II. An E. county of Virginia, on Chesapeake bay and on the N. side of Rappahannock river; area, 161 sq. m.; pop. in 1870, 5,355, of whom 3,157 were colored. The surface is nearly level, and the soil is fertile. The chief productions in 1870 were 12,978 bushels of wheat, 108,940 of Indian corn, and 22,544 of oats. There were 560 horses, 716 milch cows, 1,473 other cattle, 700 sheep, and 2,913 swine. Capital, Lancaster Court House. III. A N. county of South Carolina, bordering on North Carolina, and bounded E. by Lynche's creek and W. by Catawba river; area, 690 sq. m.; pop. in 1870, 12,087, of whom 5,924 were colored. The surface is diversified. The chief productions in 1870 were 15,872 bushels of

wheat, 100,113 of Indian corn, 16,135 of oats, 7,933 of sweet potatoes, 30,292 lbs. of butter, and 3,414 bales of cotton. There were 642 horses, 725 mules and asses, 1,539 milch cows, 2,848 other cattle, 2,366 sheep, and 4,247 swine. Capital, Lancasterville. **IV.** A S. E. county of Nebraska, watered by Salt creek and the Little Nemaha river; area, 864 sq. m.; pop. in 1870, 7,074. The surface is diversified and the soil fertile. Salt springs are found. It is traversed by the Atchison and Nebraska, the Burlington and Missouri River, and the Midland Pacific railroads. The chief productions in 1870 were 133,187 bushels of wheat, 134,400 of Indian corn, 73,239 of oats, 32,118 of potatoes, 94,018 lbs. of wool, and 7,974 tons of hay. There were 1,614 horses, 3,022 cattle, 905 sheep, and 2,205 swine. Capital, Lincoln, which is also the state capital.

**LANCASTER**, a city and the capital of Lancaster co., Pennsylvania, on the Conestoga river and the Pennsylvania Central railroad, in the midst of a rich agricultural region, 68 m. by rail and 60 m. in a straight line W. of Philadelphia, and 34 m. S. E. of Harrisburg; pop. in 1850, 12,369; in 1860, 17,603; in 1870, 20,233, of whom 3,375 were foreigners. The river from this point to where it enters the Susquehanna, at Safe Harbor, a distance of 19 m., was in 1826 made navigable for small craft by means of dams and locks. By this route, as well as by the railroad to Columbia, 12 m. distant, great quantities of coal and lumber are brought to Lancaster, the trade in these articles forming a considerable portion of the business of the place. The principal part of the town is elevated nearly 100 ft. above the Conestoga, from which the city is supplied with water, which is raised by machinery to two large reservoirs. The streets are generally straight, well paved, and lighted with gas, and cross one another at right angles; the two principal ones, King and Queen, intersect in a wide central plaza, which is generally crowded on market days. In a bend of the river in the S. part of the city is Woodward Hill cemetery, a large and picturesque ground. Most of the city is substantially built of brick, many of the houses, particularly those erected recently, being elegant and commodious. Among the public buildings, one of the most imposing is the court house, which is 160 ft. long, 70 ft. wide, two stories high, and surmounted by a dome. The county prison, a large castellated building of old red sandstone, contains 80 cells, and is kept on the solitary labor system. Its tower, 102 ft. high, is the first object which strikes the eye of a traveller approaching Lancaster. The old jail, famous as the scene of the murder of the Conestoga Indians in 1763 by the Paxton boys, was taken down in 1851, and Fulton hall, a large and elegant building, used for concerts and as a theatre, now occupies its site. A handsome monument of New Hampshire granite has recently been erected in the central square in memory of

the soldiers of Lancaster co. who fell in the civil war. There are several iron foundries and blast furnaces, extensive manufactories of locomotives, rifles, carriages, axes, &c., and three national banks, with an aggregate capital of \$890,000. Lancaster is divided into nine wards, and is governed by a mayor with a select council of one and a common council of three from each ward. The valuation of property for the year ending June 1, 1873, was \$4,744,000; expenditures, \$91,878; debt, \$369,353 96. The public schools are graded, including a boys' and a girls' high school, and are in a flourishing condition. Franklin and Marshall college was established here in 1853 by the consolidation of Franklin college, which had existed for many years as a high school, with Marshall college, which was transferred from Mercersburg. It is under the control of the German Reformed church, and has a collegiate and a preparatory course. In 1873-'4 it had 11 professors (4 in the preparatory department), 84 collegiate and 64 preparatory students, and libraries containing 12,000 volumes. The buildings, which stand on a commanding eminence in the N. W. corner of the city, are neat and substantial. In connection with the college, but under a separate board of trustees, is a theological seminary, organized in 1825, which in 1873-'4 had 3 professors, 34 students, a library of 8,000 volumes, and an endowment of \$80,000. Besides those of the college and theological seminary, there are five libraries, viz.: the Lancaster, with 2,000 volumes; Mechanics', 4,200; Athenæum, 2,000; law library association, 3,700; young men's Christian association, 2,500. Three daily and seven weekly (two German) newspapers and seven monthly (one German, and one English and German) periodicals are published, and there are 21 churches.—Lancaster was founded about 1718, and for some years was called Hickory Town. On the organization of the county in 1729, and the removal of the seat of justice from Conestoga in 1730, it took its present name. In 1742 it was chartered as a borough, and in 1818 made a city. In 1777 congress sat here for a few days. From 1799 to 1812 it was the capital of the state, and from 1750 to 1825 was the largest inland town in the country.

**LANCASTER**, a city and the capital of Fairfield co., Ohio, on Hocking river, the Hocking canal, and the Columbus and Hocking Valley and Cincinnati and Muskingum Valley railroads, 25 m. S. E. of Columbus; pop. in 1870, 4,725. The surrounding country is fertile, and contains many vineyards; the scenery is beautiful. The city is well built, the streets being wide and handsome, and many of the public and other buildings attractive. The court house, of stone, erected at a cost of \$150,000, is one of the finest in the country. The state reform school for boys, with 400 inmates and a farm of 1,400 acres mostly devoted to fruit raising, is 6 m. from Lancaster. The principal

manufactories are three of agricultural implements and machinery, one of shovels and miners' tools, a woollen mill, two flouring mills, two planing mills, two breweries, a large wine cellar, and railroad machine shops. There are two national banks, six hotels, graded public schools, including a high school, two weekly newspapers, and 11 churches.

**LANCASTER**, a municipal borough and river port of England, capital of Lancashire, on the left bank of the Lune, on the canal from Preston to Kendal, and on the Preston, Lancaster, and Carlisle railway and a branch of the Great Northwestern, 44 m. N. by E. of Liverpool; pop. in 1871, 17,248. It is built chiefly on the side of a hill, the summit of which is crowned by a church and castle. The older streets are narrow, but many of the houses are handsome, and there are several striking public buildings. The river is here crossed by a bridge of five arches and a magnificent aqueduct for the ca-

from Torbay in 1601, with five vessels, and returned to England in 1603, having established commercial relations with the princes of Bantam in Java and Acheen in Sumatra. He entered warmly into the projects for discovering a N. W. passage to India, and strongly urged the government to attempt it. Baffin named after him a sound opening into Baffin bay. Lancaster was knighted by Queen Elizabeth.

**LANCASTER, Joseph**, an English educator, born in London in 1771 or 1778, died in New York, Oct. 24, 1838. In 1798 he opened a school for poor children in Southwark on the principle of mutual instruction, first introduced in India by Dr. Andrew Bell. He taught almost gratuitously, and the number of his pupils gradually increased to 300. His success attracted public attention, subscriptions poured in to him from all quarters, and numerous schools on the same plan were opened by him in different parts of the country. From 1807 to 1811

he travelled through the country, lecturing on education. In 1812 he attempted to found a school for children of opulent parents, but failed, and became insolvent. He emigrated in 1818 to the United States, where he was well received, but injured his prospects by imprudence. In 1829 he went to Canada, where the legislature made some pecuniary grants to enable him to give his system a fair trial. Again becoming embarrassed, some of his friends purchased for him a small annuity, and he removed to New York. He wrote

Lancaster Castle.

nal. The town hall, county lunatic asylum, baths, assembly rooms, custom house, churches, and castle are the most interesting edifices. A commodious building, formerly the theatre, contains a music hall and the museum of the natural history society. The castle is remarkable for its size and elegance, and embraces the courts, jail, penitentiary, &c. The principal manufactures are furniture, cotton, sail cloth, and cordage. The foreign trade is mostly removed to Liverpool, but it has still considerable commerce.

**LANCASTER, House of.** See ENGLAND, vol. vi., pp. 609-11.

**LANCASTER, Sir James**, an English navigator, born about 1550, died in 1620. He sailed from Plymouth April 10, 1591, with three vessels, visited Ceylon and Sumatra, and dispossessed the Spanish and Portuguese trade. He was appointed to command the first expedition sent out by the English East India company, sailing

a work on "Improvement in Education" (London, 1805), several elementary school books, and pamphlets in defence of his system, which has been known by his name and successfully practised in many parts of Great Britain and other countries.

**LANCASTER SOUND**, a channel leading from Baffin bay W. to Barrow strait, in the American arctic regions. Its E. entrance lies between Capes Horsburgh on the north and Liverpool on the south, in lat. 73° 45' to 74° 55' N., lon. 79° W. On the west it opens into Prince Regent inlet, Barrow strait, and Wellington channel. It is the entrance to the N. W. passage, and was probably in the course of Sir John Franklin's last voyage. Its length is about 250 m., its central breadth about 65 m. The great island of North Devon forms its northern coast, and several islands formerly thought to be part of Cockburn island its southern. On the former side Croker bay

opens into it; on the latter it receives Navy Board and Admiralty inlets. It was discovered by Baffin in 1616.

**LANCE**, a weapon. See ARMS.

**LANCE**, **George**, an English painter, born at Little Easton, near Colchester, March 24, 1802, died June 18, 1864. He studied with Haydon, and first exhibited at the academy in 1828. His favorite subjects were fruit, flowers, game, &c., arranged in picturesque and effective confusion, and executed with an elaborateness and a richness of color almost equalling the efforts of the old Dutch masters of still life. Sometimes figures are introduced, as in his "Red Cap," in which a monkey is represented presiding over a table covered with fruits and festal appointments. He also painted historical and imaginative pieces. He restored a large portion of the celebrated "Boar Hunt" of Velasquez in the British national gallery.

**LANCELET** (*branchiostoma* or *amphioxus*), the lowest known of the vertebrate animals, constituting the order *pharyngobranchii* of Huxley, the *leptocardia* of Haeckel, who regards it as a primary division of the branch of vertebrates. This anomalous fish has been found on the coasts of Great Britain and Sweden, in the Mediterranean, on our southern Atlantic coast, and in the Indian ocean. It is from 1½ to 2 in. long, tapering at each end, ribbon-like, translucent, and silvery white; it generally burrows in the sand in deep water, feeding on minute animalcules. Along the back runs a median fin, expanding at the tail into a lancet-shaped caudal; there are no apparent pectorals and ventrals; at the lower surface, extending

Lancelet (*Amphioxus lanceolatus*).

1. Upper side. 2. Lower side. 3. Anatomical diagram: A, notochord; B, spinal chord; C, mouth surrounded by cilia; D, greatly dilated pharynx perforated by ciliated clefts; E, intestine terminating in anus; F; G, haemal system.

forward from the anal and branchial apertures, are two lateral folds, which led Pallas to regard it as a gasteropod mollusk. The mouth is a longitudinal fissure, in the front of the head, without jaws, but surrounded by several car-

tilaginous filaments. The mouth opens into a greatly developed pharynx or throat, the walls of which, strengthened by cartilaginous filaments, are perforated by transverse slits, the whole covered with a thickly ciliated or fringed membrane; this is the respiratory sac, the water entering by the mouth, passing between the branchial slits and over the ciliary fringes filled with blood into the abdominal cavity, and escaping by an opening on the lower surface in front of the vent (*porus abdominalis* of Müller). From the branchial sac the intestine, having a liver-like organ attached, extends to an oval aperture under the tail. There is no single contractile cavity or heart, the only exception in vertebrates, the circulation being effected by several contractile dilatations of the great blood vessels, as in the annelids; the blood is colorless. There is no proper skeleton; the vertebral column, moto-chord or *chorda dorsalis*, is a semi-gelatinous rod, enclosed in a sheath and supporting the spinal cord, and is composed of 60 to 70 fibrous laminae loosely attached to each other; there is also a cartilaginous apparatus supporting the mouth, and 70 to 80 hair-like ribs surrounding the branchial cavity. There is no skull, and no expansion of the spinal cord into a brain, though from its anterior extremity are given off nerves to the rudimentary eyes, and perhaps other nerves of special sense. The arrangement of the muscles is fish-like; the skin is thin, but tough and scaleless. The location of the respiratory system in the anterior portion of the intestinal canal is met with also in the cyclostome fishes. This most aberrant form is clearly a vertebrate, though it has no brain, and the respiration and circulation of an annelid. It has been believed by some to favor the idea of Kowalewsky and Kupffer, that the ascidians show a kinship to the vertebrates, and it certainly has some remarkable invertebrate features found in no other vertebrate animal. The common species is the *B. lanceolatum*.

**LANCELOT**, **Dom Claude**, a French grammarian, born in Paris about 1615, died at Quimperlé, April 15, 1695. In early life he attracted the attention of Duvergier de Hauranne, the celebrated abbot of St. Cyran, and through his influence he joined the recluses of Port Royal, whom he greatly assisted in the organization and management of their schools. He wrote grammars of the Latin, Greek, Italian, and Spanish languages, and a *Grammaire générale et raisonnée*, better known as *Grammaire de Port Royal*, which has been frequently reprinted. On the dispersion of the society of Port Royal in 1660, Lancelot became preceptor of the duke of Chevreuse's son, and from 1669 to 1672 was attached in the same capacity to the two young princes of Conti. In 1673 he retired to the abbey of St. Cyran, where he led a life of austerity; and in 1680 was ordered to Quimperlé, where his last years were spent in devotion. Besides his philological works, he left a manuscript memoir of the abbot of St.

Cyran, which was published in Cologne in 1738, and an account of a tour in 1667 to La Grande Chartreuse and Alet (London, 1813).

**LANCELOT OF THE LAKE**, a hero of British mythology, one of the knights of King Arthur's round table. He was brought up at the court of Vivien, the Lady of the Lake, whence his surname. He became Arthur's favorite knight; and when the king was about to marry, he was sent to conduct the royal bride, Guinevere, to the court. Afterward he is represented as carrying on an intrigue with the queen, which is the origin of most of his adventures. He is the subject of a celebrated romance by an unknown author, which was originally written in Latin, and was translated into Anglo-Norman by Walter Mapes in the latter part of the 12th century. Tennyson has used the character of Lancelot more than any other modern poet, making him the hero of two of the "Idyls of the King," viz., "Elaine" and "Guinevere." Elaine, "the lily maid of Astolat," preserves his shield in her chamber, which he had exchanged for her brother's when he went to tilt for the great diamond, dreaming over it, and finally dies broken-hearted because her love for Lancelot is not returned.

**LANCEWOOD**, a wood imported from the West India islands and South America in poles from 15 to 20 ft. long and 3 to 6 in. in diameter. The tree is the *Duguetia Quitarensis*, of the *anonaceæ*, the family to which our papaw belongs. It resembles boxwood, but is of somewhat paler yellow. It is remarkably stiff and elastic, and is consequently well adapted for the shafts of carriages, bows, and springs. It is largely employed for these, as well as for surveyors' rods, billiard cues, and rules, which ordinarily pass for boxwood, and for anglers' rods. Species of *ozandra* and *cananga*, of the same family, are called lancewood in Jamaica.

**LANCISI, Giovanni Maria**, an Italian physician, born in Rome, Oct. 26, 1654, died there, Jan. 21, 1720. He abandoned the study of theology for the natural sciences, and at 18 graduated doctor in medicine and philosophy at the Sapienza college in Rome. In 1676 he was appointed assistant physician to one of the hospitals, and some time later was nominated to the chair of anatomy at the Sapienza, which he filled with great reputation for 13 years. Innocent XI. in 1684 presented him with a canonry. He filled various professional offices, and wrote a number of valuable works, chiefly relating to his favorite studies of anatomy, natural philosophy, and mathematics. A collection of them appeared in his lifetime (2 vols. 4to, Geneva, 1718), and a complete edition in folio was published at Venice in 1739.

**LANDAU**, a fortified town of Rhenish Bavaria, on the Queich, 18 m. N. W. of Carlsruhe, on the railway from Paris to Mentz; pop. in 1871, 6,921, exclusive of the garrison. The ground plan of the ramparts is an octagon, surrounded by moats. The barracks and casemates are bomb-proof. The town is regularly built, has

two gates, a large parade, a church used by Protestants and Catholics in common, various public offices, and some manufactories. During the thirty years' war it was taken seven times by the troops of Count Mansfeld, by the Spaniards, Swedes, imperialists, and French. In 1680 it was ceded to France and fortified by Vauban. It was taken in 1702 by Margrave Louis of Baden, but was recovered by the French in 1703, taken by the Austrians in 1704, and held till 1713, when it was again ceded to France. It sustained a siege of nine months in 1793, when 30,000 shells were thrown into it. The treaty of Paris in 1814 confirmed it to France, but the treaties of 1815 gave it to Bavaria, as a fortress of the Germanic confederation.

**LANDEN, John**, an English mathematician, born at Peakirk, near Peterborough, in January, 1719, died Jan. 15, 1790. From 1762 to 1788 he was agent for Earl Fitzwilliam. His earliest mathematical writings appeared in the "Ladies' Diary" for 1744, and most of his subsequent papers were contributed to the "Transactions" of the royal society of London, of which he was admitted a member in 1766. He is best known by his "Residual Analysis" (London, 1764), in which he proposed a new form of fluxionary calculus, and invented a set of symbols. His plan has been thought an improvement on the method of ultimate ratios, but it lacks simplicity, and was never in general use. The principal other works of Landen are: "Mathematical Lucubrations" (4to, London, 1755); "Animadversions on Dr. Stewart's Computation of the Sun's Distance" (4to, 1771); "Observations on Converging Series" (4to, 1781); "Mathematical Memoirs" (2 vols. 4to, 1780-'89).

**LANDER**, a N. county of Nevada, intersected by Humboldt river and watered by the Reese; area, 10,000 sq. m.; pop. in 1870, 2,815, of whom 218 were Chinese. The surface is diversified with mountains, hills, and valleys, comprising mineral, agricultural, and grazing lands. S. of the Humboldt are high mountain ranges, enclosing extensive valleys, some of which are fertile. These mountains form the most important metal-bearing portion of the county. The Reese river region in the S. W. is one of the principal mining districts of the state. The Central Pacific railroad crosses the county from E. to W. In 1873 the E. half, comprising the Eureka district and other rich mining sections, was set off to form Eureka co., reducing the area given above. The principal metal is silver, but considerable lead and some gold are found. The shipments of bullion in 1871 amounted to \$3,800,000. The chief agricultural productions in 1870 were 1,363 bushels of wheat, 2,062 of oats, 29,307 of barley, 17,599 of potatoes, 4,600 lbs. of wool, 20,950 of butter, and 2,245 tons of hay. There were 597 horses, 570 milch cows, 7,695 other cattle, 1,501 sheep, and 205 swine; 3 manufactories of pig lead and 1 quartz mill. Capital, Austin.

**LANDER, Richard**, an English traveller, the discoverer of the course of the river Niger in Africa, born in Truro, Cornwall, in 1804, died on the island of Fernando Po in February, 1834. He was brought up as a printer, but in 1825 accompanied Capt. Clapperton upon his second African expedition. After the death of Clapperton he returned to England, and published "Records of Capt. Clapperton's Last Expedition to Africa" (2 vols. 8vo, London, 1829-'30), prepared from Clapperton's papers and his own journal. In January, 1830, accompanied by his brother John, he sailed for Africa under government auspices to continue the explorations. Departing from Badagry near Cape Coast Castle, March 22, he reached Boossa on the Quorra, or Niger, June 17. Thence the brothers ascended the river 100 m. to Yaorie, and returning to Boossa early in August, commenced the descent of the stream in canoes, Sept. 20. They reached the mouth of the river through its principal arm, the Nun, in the latter part of November, and in June, 1831, arrived in England. In the succeeding year a narrative of the expedition, prepared by Lieut. Becher from the account of the Landers, was published in 2 vols. with a map. They were the first to ascertain the confluence of the Niger with the Benoowe or Tchadda. In 1832 an expedition, consisting of a brig and two small steamers, organized by a company of Liverpool merchants for the purpose of opening a trade with the tribes along the Niger, and placed under the command of Richard Lander, ascended that river to Boossa. The natives showed little disposition to trade with the Europeans, and Lander returned ill to the seacoast in the succeeding spring, with the loss of several of his men by sickness. In July he reascended the river; but the expedition, as a commercial venture, was a failure. On this voyage he ascended the Benoowe as far as the country of Domah, 104 m. On Nov. 27 the expedition was again in motion up the river under the command of Dr. Oldfield. Richard Lander, following with supplies, was wounded, Jan. 20, 1834, in a conflict with the natives of the Eboe country. He escaped in a canoe, and reached Fernando Po, where he died soon after. In 1835 an account of his last voyage was published under the title of "Narrative of the Expedition into the Interior of Africa by the River Niger, in the Steam Vessels Quorra and Alburkah, in 1832, 1833, and 1834, by McGregor Laird and R. A. K. Oldfield, surviving officers of the expedition."

**LANDERNEAU**, a seaport of Brittany, France, in the department of Finistère, 14 m. E. N. E. of Brest; pop. in 1866, 7,853. The town is built on both sides of the Éloron or Landerneau, near its entrance into the roadstead of Brest, and has a good harbor. It contains a fine Gothic church, a communal college, a large convent, and extensive marine barracks. Linen, leather, glazed hats, and refined wax are manufactured. The streets are narrow, but

the quays are lined with fine buildings. About 700 vessels enter and clear annually.

**LANDES, Les**, a S. W. department of France, in Gascony, bordering on the bay of Biscay and on the departments of Gironde, Lot-et-Garonne, Gers, and Basses-Pyrénées; area, 3,597 sq. m.; pop. in 1872, 300,528. The name is derived from the sandy and marshy plains which compose the greater part of its surface, and which prevail generally in the interior, and in many places are covered with thorny shrubs over which the shepherds stalk on stilts. The only crops which the *landes* yield are maize and barley. The coast district is studded with numerous lagoons; but toward the south, where the spurs of the Pyrenees break the continuity of the plain, and the tributaries of the Adour irrigate the soil, the country is fertile, and abounds in corn, wine, and various kinds of fruit. The other productions of this department are timber, coal, iron, and marble. The climate is mild, but unhealthy. Among the principal manufactures are glass, porcelain, earthenware, paper, and leather, employing about 6,000 persons. The chief rivers are the Adour, Leyre, and Gave-de-Pau. The department is divided into the arrondissements of Dax, Mont-de-Marsan, and St. Sever. Capital, Mont-de-Marsan.

**LONDON, Letitia Elizabeth (MACLEAN)**, an English authoress, born in Old Brompton, a suburb of London, in 1802, died at Cape Coast Castle, Africa, Oct. 15, 1838. At the age of 13 she began to write poetry, and in 1820 she published in the "Literary Gazette" some short poems, signed "L. E. L.," which attracted considerable attention. She soon became a general contributor to the "Gazette" of reviews and miscellaneous articles, as well as original poems. Her father died in destitute circumstances when she was a child, and she became the chief support of her family, and for 15 years was a ready and prolific writer in prose and verse for the annuals and for a variety of periodicals. In 1821 she published a small collection entitled "The Fate of Adelaide, and other Poems," which was succeeded by "The Improvisatrice" (1824), "The Troubadour" (1825), "The Golden Violet" (1827), "The Venetian Bracelet" (1829), and "The Vow of the Peacock" (1835). Her poetry is mainly of the kind which is warmly admired by youthful readers, but is soon outgrown, full of sentiment and delicate fancies melodiously versified. She also published four novels. In June, 1838, she was married to George Maclean, governor of Cape Coast Castle in West Africa, and soon afterward sailed with him for her new home. She died in a few months after her arrival there, from an overdose of prussic acid, which she had been accustomed to take in small quantities for hysterical affections, and was discovered lying dead upon the floor of her chamber. "The Zenana, and Minor Poems," with a memoir, was published posthumously (1839).—See "Life and Literary Re-

mains of L. E. L.," by Laman Blanchard (2 vols., London, 1841).

**LANDOR, Walter Savage**, an English author, born at Ipsley Court, Warwickshire, Jan. 30, 1775, died in Florence, Italy, Sept. 17, 1864. His parents were very wealthy, and he was educated under private tutors and at Rugby and Oxford. Being rusticated for firing a gun in the quadrangle, he never returned to the university to take his degree. He was designed at first for the army and then for the bar, but ultimately devoted himself entirely to literary pursuits. On the death of his father he succeeded to the family domains, and purchased other estates in Monmouthshire; he expended £7,000 in improving them, and built a mansion which cost £8,000; but in 1806, in disgust with some of his tenantry, one of whom had absconded several thousand pounds in his debt, he sold off his entire property, a part of which had been in his family for 700 years, ordered the mansion to be demolished, and determined to live abroad. In 1808, at the outbreak of the insurrection in Spain against Napoleon, Landor raised a body of troops at his own expense, conducted them to Gen. Blake in Galicia, presented 20,000 reals to the cause, received the thanks of the supreme junta, and was appointed a colonel in the Spanish army. He resigned his commission on the restoration of King Ferdinand and the subversion of the constitution. In 1811 he married Julia Thuillier de Malaperte, of Bath, a daughter of the baron de Nieuveville. From 1815 to 1835 he resided in Italy, then returned to England and resided at Bath till 1858, when he removed again to Italy. For several years he occupied the palace of the Medici at Florence, and then purchased the villa and garden of Count Gherardesca at Fiesole. He published a small volume of poems in 1795, and "Gebir," a long poem, in 1798; but he first really became known as an author by the publication of "Count Julian," a tragedy (1812). In 1820 he published at Pisa his Latin *Idyllia Heroica*, with an appendix in Latin prose on the reasons why modern Latin poets are so little read. His literary reputation was greatly increased by his prose work entitled "Imaginary Conversations" (5 vols. 8vo, London, 1824-'9). These supposed dialogues between remarkable personages of past or present times illustrate the peculiarities of the different interlocutors and of the periods in which they lived, and also abound in paradoxical and original opinions. They were followed by "Pericles and Aspasia" (1836), "A Satire on Satirists and Admonition to Detractors" (1836), the "Pentameron and Pentalogia" (1837), and the dramas "Andrea of Hungary and Giovanna of Naples" (1839). All these works were written in Italy. During his residence at Bath he published the "Hellenics" (1847); "Popery, British and Foreign" (1851); "Last Fruit off an Old Tree" (1853); "Letters of an American" (1854), under the pseudonyme of Pottinger; "Antony and Octavius"

(1856); "Dry Sticks Fagoted" (1858); and frequent contributions to the "Examiner" newspaper. The last named book contained some most objectionable poems, libelling a lady of Bath to whom Landor had conceived an intense personal dislike, for which a judgment of £1,000 was obtained against him. An edition of his collected works was published in London in 1846 (2 vols. 8vo; reprinted in 1853). The first complete edition of his works was commenced in 1874 (7 vols. 8vo, London). His life has been written by John Forster (London, 1869; new ed., 1874). All of Landor's writings contain highly intellectual passages, but his poems especially display an effort to reproduce the genius and style of Hellenic poetry, and seem foreign to modern habits of thought.—His brother, the Rev. ROBERT EYRES LANDOR, is the author of several works, including two remarkable novels, "The Fawn of Sertorius" (2 vols., 1846) and "The Fountain of Arethusa" (2 vols., 1848).

**LANDSBERG**, a town of Prussia, in the province of Brandenburg, on the Warthe, 40 m. N. E. of Frankfort-on-the-Oder; pop. in 1871, 18,531. It is walled and well built, contains a gymnasium, a *Realschule*, three churches, an almshouse, and lunatic and orphan asylums. It has iron founderies and manufactories of woollen and linen cloth, hosiery, leather, paper, and machinery, and an important trade in wool, lumber, and corn.

**LANDSCAPE ARCHITECTURE.** See PARK.

**LANDSCAPE GARDENING.** See PARK.

**LANDSEER. I. John**, an English engraver, born in Lincoln in 1769, died Feb. 29, 1852. His reputation was founded on the engravings furnished for Bowyer's edition of Hume's "History of England" and Moore's "Views in Scotland" toward the close of the last century, and on a series from the works of Rubens, Snyders, and other artists. In 1806 he delivered a course of lectures on engraving at the royal institution, which were published in 1807. At the same time he was elected an associate engraver in the royal academy, an honor which he accepted for the purpose of removing the restrictions against the admission of engravers to full membership. Failing in this object, he devoted himself chiefly to literary pursuits, and started at different periods two art journals, both of which speedily failed. He also published a quarto volume on engraved gems and hieroglyphics. His "Descriptive, Explanatory, and Critical Catalogue of five of the Earliest Pictures in the National Academy" (London, 1834) is full of amusing gossip. His best engraving is the "Dogs of Mount St. Bernard," from one of the earliest pictures of his son, Sir Edwin Landseer. **II. Thomas**, eldest son of the preceding, born about the close of the last century. He adopted his father's profession, and executed many engravings in mezzotint from his brother Edwin's pictures. One of his best known works is an engraving of Rosa Bonheur's celebrated

picture of the "Horse Fair" (1861). His best engravings are after his brother's pictures, of which he has caught the spirit and style. He has published the "Life and Letters of William Bewick" (2 vols., 1871). **III. Charles**, brother of the preceding, a genre painter, born in 1799. He received his first instructions in painting from Haydon, and entered the schools of the academy in 1816. He exhibited in the royal academy in 1828, and several times received the highest prize of the art union. Among his most popular pictures are "Pamela," "Clarissa Harlowe," "The Monks of Melrose," "The Departure in Disguise of Charles II.," and "The Return of the Dove to the Ark." He was elected a royal academician in 1845, and was appointed a keeper in 1851. **IV. Sir Edwin**, brother of the preceding, a painter of animals, born in London in 1803, died there, Oct. 1, 1873. While a child he was remarkable for skill in drawing. His father took him to the fields, and made him copy the ordinary domestic animals, at rest or in motion, from the life, and in the same way caused him to acquire his first notions of color; and at the age of 14 he attracted attention by his spirited sketches. Two years later he exhibited his "Dogs Fighting," which was purchased by Sir George Beaumont, and shortly afterward a striking picture of two St. Bernard dogs rescuing a traveller from the snow, which was engraved by his father. About this time he received to a limited extent instruction and advice from Haydon, but never became a regular pupil. He also drew in the schools of the royal academy, and from the Elgin marbles. In 1827 he was elected an associate member of the royal academy, having just reached the requisite age, and about the same time made a visit to the highlands of Scotland, the impressions derived from which have been reproduced in a series of characteristic works. In 1847 he was elected a member of the royal academy of Belgium; in 1850 he was knighted; and in 1855 he received a gold medal at the universal exposition in Paris, being the only English artist so distinguished. Upon the death of Sir Charles Eastlake, in 1865, he was elected president of the royal academy, but declined the office. Among his best known pictures are: "The Return from Deer-Stalking," exhibited in 1827; "The Illicit Whiskey Still," 1829; "Highland Music," 1830; "Poachers: Deer-Stalking," 1831; "Sir Walter Scott and his Dogs," 1833; "The Drover's Departure," 1835; "A distinguished Member of the Humane Society," 1838; "High Life and Low Life," 1840; "The Shepherd's Prayer," 1845; "The Stag at Bay," 1846; "The Random Shot," 1848; and "Night and Morning" and "The Children of the Mist," 1853. Among his more recent works are "The Connoisseurs," containing a portrait of himself; "The Defeat of Comus;" "Pen, Brush, and Chisel," a sketch of Chantrey's studio; "The Sanctuary;" "Taming the Shrew;" and "Windsor Forest."

From 1858 many of his works were drawings in chalk, which are much admired. For many years his pictures were regularly engraved, and for the copyright of some of them he received as much as £3,000 in addition to the price of the picture. A series has been published entitled "The Forest," from drawings by Landseer. Many of his finest sketches were presented to the duchess of Bedford, between whom and himself a warm friendship existed for years, and are now in the possession of her daughter the duchess of Abercorn. He was incomparably the best animal painter of his time, and he also produced a number of admirable etchings; but it is generally conceded that in designing the lions for the base of Nelson's monument, London, unveiled in 1867, he failed as a sculptor. A sale of his works in London in 1874 realized £73,400. Landseer was noted for his wit and his genial social qualities. He never married. He was buried in St. Paul's cathedral, beside Reynolds and Turner.—See "Early Works of Sir Edwin Landseer," by F. G. Stephens (London, 1868), and "Memoirs of Sir Edwin Landseer," by the same (1874).

**LAND'S END** (anc. *Bolerium Promontorium*), a remarkable headland, the most western point

Land's End.

of Great Britain, projecting into the Atlantic at the W. extremity of Cornwall. It is formed of granite cliffs, whose summits are 60 ft. above the level of the sea. About a mile from it are the dangerous rocks called the Longships, on which is a lighthouse with a fixed light 88 ft. above high water. On a peninsula near by is one of those natural curiosities called "logging" or "logan stones," so poised on a fulcrum that they can be made to rock.

**LANDSHUT**, a town of Bavaria, capital of the district of Lower Bavaria, on the Isar, 39 m. N. E. of Munich; pop. in 1871, 14,141. It has a Protestant and three Catholic churches, two convents, and a Franciscan monastery, a

gymnasium with a Latin school, and an industrial, an agricultural, and a commercial school. In 1800 the university of Ingolstadt was transferred to Landshut, where it remained till 1826, when it was removed to Munich. The castle of Trausnitz, which overlooks the town, was at one time the residence of the dukes of Lower Bavaria; in it Conradin, the last of the Hohenstaufen, was born in 1252. In the latter half of the 14th century, and throughout the 15th, Landshut was the capital of the duchy of Bavaria-Landshut.

**LANDSHUT**, or *Landeshut*, a town of Prussia, in the province of Silesia, on the Bober, 49 m. S. W. of Breslau; pop. in 1871, 5,673. It has several bleaching grounds and a considerable linen trade. The Lutheran church of the Holy Trinity, on a neighboring hill, was one of the six churches which the emperor Joseph I. allowed the Silesian Protestants to build. The Landshuter Kamm, a point of the Riesengebirge near Landshut, is 3,000 ft. high. In June, 1760, the Austrian general Laudon obtained here a great victory over the Prussians.

**LANDSKRONA**, a fortified town and seaport of Sweden, in the län of Malmö, 16 m. N. N. E. of Copenhagen; pop. in 1869, 7,323. It is handsomely built on a tongue of land projecting into the sound, and has a good harbor and a strong citadel. It contains a fine church, an assembly house, a large sugar refinery, an iron foundry, a woollen mill, machine shops, tanneries, and ship yards. Corn, fish, pitch, timber, and alum are exported. Coal fields have recently been discovered in the vicinity. A mile from the shore is the island of Hven, formerly the residence of Tycho Brahe; but nothing of the observatory now remains.

**LANE**, a W. county of Oregon, bounded E. by the Cascade mountains, S. partly by the Sinlaw river, and W. by the Pacific ocean; area, 3,500 sq. m.; pop. in 1870, 6,426. It embraces the head of the Willamette valley, that river being navigable eight months in the year to the county seat. The W. portion is mountainous; the S. portion, forming the valley, is fertile. The Calapooya mountains separate it from the valley of the Umpqua. The Oregon and California railroad passes through it. The chief productions in 1870 were 294,771 bushels of wheat, 235,722 of oats, 24,687 of barley, 32,455 of potatoes, 167,893 lbs. of wool, 155,214 of butter, and 5,381 tons of hay. There were 4,874 horses, 5,158 milch cows, 5,680 other cattle, 52,745 sheep, and 19,557 swine; 1 flour mill and 3 saw mills. Capital, Eugene City.

**LANE**, *Edward William*, an English orientalist, born in Hereford in 1801. The greater part of his life has been devoted to the study of the oriental languages, particularly Arabic, in which he is deeply learned; and for many years he has been employed in preparing an Arabic lexicon and thesaurus, the first part of which appeared in 1863, and the second in 1865, but which is not yet completed. As an author he is widely known by his translation of the

"Arabian Nights," published in three magnificent volumes, with illustrations by W. Harvey (1840), and by his "Manners and Customs of the Modern Egyptians," published by the society for the diffusion of useful knowledge (3d ed., with additions, 2 vols. 8vo, London, 1842), one of the most valuable works of the kind ever published, and the materials for which were procured during a lengthened residence in Cairo. He has also published "Arabian Tales and Anecdotes," and "Eastern Tales and Anecdotes."

**LANFRANC**, archbishop of Canterbury, born in Pavia about 1005, died in Canterbury, England, May 24, 1089. He studied civil law in the university of Bologna, and after practising in Pavia established himself at Avranches in Normandy, where he taught jurisprudence. While on a journey to Rouen he was attacked by robbers, who left him for dead, but was rescued by the monks of the Benedictine abbey of Bec; he entered that order, and in 1046 was chosen prior of Bec. He opened a school to which pupils resorted from England, France, Germany, Flanders, and even Italy. Among the learned men whom his reputation attracted thither was Berengarius, archdeacon of Angers, with whom he carried on a famous controversy on the subject of the eucharist. He denounced the illegal marriage of Duke William of Normandy with his cousin, daughter of the count of Flanders, and was ordered to leave Normandy; but he had an interview with the duke in 1053, became his friend, and procured for him a dispensation from the pope legalizing the marriage. William appointed him a councillor of state, and in 1066 abbot of the newly erected monastery in Caen, where he established a school. In 1067 he declined the archbishopric of Rouen, to which he was chosen by the people; but William caused him to be elected to the see of Canterbury, vacant by the deposition of Stigand, and he was consecrated in 1070. He successfully established the claims of his see to the primacy of England, and gave proof of his attachment to William by placing in vacant bishoprics and over the chief religious houses ecclesiastics of known fidelity to the Norman interest. The chief direction of affairs both in church and state was committed to his hands whenever the king was absent in Normandy. He crowned William Rufus, on whose accession he was intrusted with the government. He improved the discipline of the monastic bodies, enforced the celibacy of the priesthood, established schools, convents, and hospitals, and built churches and cathedrals. His works, consisting of commentaries on St. Paul's epistles, letters, sermons, and his treatise on the eucharist against Berengarius, were published in Paris in 1648 (new ed. by Giles, 2 vols., Oxford, 1844-'5).

**LANFRANCO**, *Giovanni*, an Italian painter, born in Parma in 1581, died in Rome in 1647. While a boy in the service of Count Orazio Scotti in Piacenza, he attracted the attention

of his master by some designs executed upon a wall with charcoal. He was placed under Agostino Carracci, and subsequently studied at Rome with Annibale Carracci, whom he assisted in decorating the Farnese palace. His chief work is the cupola of S. Andrea della Valle in Rome, which is one of the most beautiful in the city, and was the result of four years' study and labor. The paintings at the angles are by Domenichino in his best style. Lanfranco also painted the beautiful cupola of the church of Gesù Nuovo in Naples, which was destroyed by an earthquake in 1688. He executed many minor works, but his cupolas were most famous. He adopted in them a bold, coarse style (even using a sponge, it was said, instead of a brush), which was well adapted to great heights, and made his figures stand out in fine relief.

**LANFREY, Pierre**, a French historian, born in Chambéry in 1828. He completed his studies in Paris, and became known in 1857 by his *L'Église et les philosophes du 18<sup>m</sup>e siècle*, and in 1858 published *Essai sur la révolution française*. In 1860 appeared his *Histoire politique des papes*, and in 1863 *Le rétablissement de la Pologne*. His principal work is the *Histoire de Napoléon 1<sup>er</sup>* (6 vols., Paris, 1867-'74; English translation, London, 1867 et seq.), which, like all his writings, is distinguished by a scrupulous statement of facts. It severely arraigns the moral and political character of the emperor. During the Franco-German war Lanfrey served with the mobiles of Savoy. In February, 1871, he was elected to the national assembly, and in October was appointed by Thiers minister at Bern, a position which he still holds (1874).

**LANG, Heinrich**, a German theologian, born at Frommern, Württemberg, Nov. 14, 1826. He studied under Baur and Zeller in Tübingen, and in 1863 became pastor at Meilen, near Zürich, and in 1871 of St. Peter's church in that city. He established a periodical in the interest of liberal Christianity, and has published many works, the principal of which are: *Versuch einer christlichen Dogmatik* (1857; 2d revised ed., 1868); *Eingang durch die christliche Welt* (1859; 2d ed., 1870); *Stunden der Andacht* (2 vols., 1862-'5); *Religiöse Charaktere* (1862); *Martin Luther* (1870); and *Das Leben Jesu und die Kirche der Zukunft* (1872).

**LANG, Louis**, an American artist, born at Waldsee, Württemberg, March 29, 1814. At 16 years of age he executed likenesses in pastel, and during a residence of four years on the lake of Constance he painted nearly 1,000 portraits in pastel and oil. He went in 1834 to Paris, and about 1838 came to America. In 1841 he went to Italy, and studied in Venice, Bologna, Florence, and Rome. In 1845 he returned to America, taking up his residence in New York, and for two years employed himself in the decoration of interiors and in modelling plaster figures for ornamental purposes. In 1847 he again visited Rome, and remained there two years, returning to New York in 1849.

**LANGBAINE. I. Gerard**, an English scholar, born in Westmoreland about 1608, died in 1658. The greater part of his life was passed at Oxford, where he was provost of Queen's college, and keeper of the university archives. He was an industrious writer, and succeeded in avoiding the political troubles of the time. His chief work was an edition of Longinus, in addition to which he published a number of minor treatises on church questions and miscellaneous topics. **II. Gerard**, son of the preceding, born in Oxford in 1656, died in 1692. He was educated at University college, Oxford, and after a career of idleness and extravagance devoted himself to literary pursuits. He gave particular attention to the history of dramatic literature, and collected, it is said, about 1,000 old plays. He republished a catalogue of plays made by Kirkman, a bookseller, under the title of "Momus Triumphans" (1687). This work was speedily sold off, and was improved into "A New Catalogue of English Plays" (1688). Still further amendments and additions produced his "Account of the English Dramatic Poets" (1691, 1699, and 1719). These catalogues manifest little taste or judgment, but are valuable to the student of dramatic history from the accuracy with which facts are related and editions described. Commentators and others have borrowed copiously from Langbaine, many of them without acknowledgment.

**LANGBEIN, August Friedrich Ernst**, a German author, born near Dresden, Sept. 6, 1757, died in Berlin, Jan. 2, 1835. He studied law, filled various public offices, and from 1820 till his death was censor of belles-lettres publications for the Prussian government. His complete works were published in 31 vols. (Stuttgart, 1835-'7), and comprise humorous poems, tales, and novels, some of which have been very popular. An edition in 8 vols. was published with a memoir by Gedicke in 1839, and a new edition appeared in 1854.

**LANGDON, John**, an American statesman, born in Portsmouth, N. H., in 1739, died there, Sept. 18, 1819. He received a common school education, and entered a counting house. In 1774 he participated in the removal of the armament and military stores from Fort William and Mary in Portsmouth harbor. In 1775 he was a delegate to the continental congress, but resigned in June, 1776, on becoming navy agent. In 1777, while speaker of the New Hampshire assembly, he pledged a large portion of his property for the purpose of equipping the brigade with which Stark defeated the Hessians at Bennington. He served in command of a volunteer company at Bennington and Saratoga, and in Rhode Island. Subsequently he was a member and speaker of the state legislature, a member of the continental congress, a delegate to the convention which framed the constitution of the United States, and president of New Hampshire. In 1788 he was chosen governor of New Hampshire, and in 1789 was elected United States

senator, which office he held till 1801. In politics he was a republican, and acted with Jefferson, who upon assuming office in 1801 offered him the post of secretary of the navy, which he declined. From 1805 to 1812, with the exception of two years, he was governor of New Hampshire; and in 1812 the republican congressional caucus offered him the nomination for the office of vice president of the United States, which, on the score of age and infirmities, he declined. The remainder of his life was passed in retirement.

**LANGE, Johann Peter**, a German theologian, born at Sonnborn, near Elberfeld, April 10, 1802. Of humble origin, he seized occasional advantages for study, spent a year and a half at the gymnasium of Düsseldorf, and in 1822 entered the university of Bonn. He studied theology under Lücke and Nitzsch, and after preaching at Langenberg and Duisburg, became in 1841 professor of church history and dogmatics at Zürich. In the beginning of 1854 he was appointed professor of systematic theology at Bonn, and in 1860 counsellor of the consistory. He has published theological and exegetical works of great thoroughness and ability. The most celebrated are his *Leben Jesu* (3 vols., Heidelberg, 1844-'7; English translation, "The Life of the Lord Jesus Christ," by Sophia Taylor and J. E. Ryland, Philadelphia, 1872), which appeared during the Strauss controversy, and is in some respects one of the ablest works on the subject; *Die christliche Dogmatik* (3 vols., 1849-'52); *Die Geschichte der Kirche* (part i., *Das apostolische Zeitalter*, 2 vols., Brunswick, 1853-'4); and his great *Theologisch-homiletisches Bibelwerk*, forming the basis of what has been published in America as "Lange's Commentary," of which the plan and the treatment of the leading books of the Old and New Testaments are Lange's, and appeared in Germany from 1853 to 1864, while portions are by other scholars. The American translation is edited by Prof. Philip Schaff (New York, 1865 *et seq.*).

**LANGE, Ludwig**, a German archaeologist, born in Hanover, May 4, 1825. He graduated at Göttingen in 1849, and became professor there in 1853, at Prague in 1855, at Giessen in 1859, and at Leipsic in 1871. His principal work is *Handbuch der römischen Alterthümer* (3 vols., Berlin, 1856-'74). In 1874 he published at Leipsic *Die Epheten und der Areopag vor Solon*.

**LANGELAND**, an island of Denmark, between the islands of Laaland and Fünen, separated from the former by the Langeland Belt, and from the latter by a narrow channel of great depth, having the Great Belt on the north and the Baltic on the south; length from N. to S. 33 m., average breadth about 3 m.; area, 106 sq. m.; pop. in 1864, 18,399. The E. coast is washed by a strong current, and has no harbors; the W. coast is free from currents, is deeply indented, contains many excellent harbors, and furnishes throughout one great roadstead with safe anchorage for the largest ves-

sels. The island is fertile, yielding much grain and dairy produce. It is included in the bailiwick of Svendborg. Capital, Rudkiöbing, which is a port with considerable shipping.

**LANGENSALZA**, a town of Prussia, in the province of Saxony, on the Salza, near its entrance into the Unstrut, 17 m. N. W. of Erfurt; pop. in 1871, 9,484. It has four churches, a *Realschule*, a female school of a higher grade, and manufactories of linen and of machines. On June 27, 1866, a battle was fought here between the Prussians and Hanoverians, in which the latter repulsed the Prussians, but on the following day surrendered to them.

**LANGER, Robert von**, a German painter, born in Düsseldorf in 1783, died at Haidhausen, Oct. 6, 1846. He was a son of the historical painter Johann Peter von Langer (1756-1824), and became professor at the academy of Munich and chief director of the national galleries, and organized the Pinakothek. He illustrated Dante's *Inferno*, and his other works consist chiefly of frescoes from Biblical and ancient history. It was mainly through his efforts that Rubens's "Battle of the Amazons" and other works were restored.

**LANGHORNE, John**, an English poet, born at Kirkby-Stephen, Westmoreland, in March, 1735, died in Wells, Somersetshire, April 1, 1779. He took orders, and went to Cambridge, where he supported himself by teaching in a gentleman's family. On account of an unfortunate attachment to the daughter of his employer he left his situation and went to London, where he wrote for periodicals, obtained the curacy of St. John's, Clerkenwell, and was appointed assistant preacher of Lincoln's Inn. In 1765 he published a short poem entitled "Genius and Valor," to defend the Scotch against the aspersions of Churchill; for this he received the degree of D. D. from the university of Edinburgh in 1766, and in 1767 he married the lady to whom he had previously paid unsuccessful suit. She belonged to a wealthy family, and the living of Blagden in Somersetshire was purchased for her husband; but within a year she died in childbed. Langhorne then removed to Folkestone, where, in conjunction with his brother William, who held a curacy in that town, he wrote his translation of Plutarch's "Lives" (1771), the work by which he is best known. He married again, and lost his second wife also in childbed in 1776. In 1777 he obtained a prebend in the cathedral of Wells. He was a voluminous writer of tales, short poems, and sermons, which are little valued. A collection of his poems with a memoir of the author was published by his son in 1802, in 3 vols. 8vo.

**LANGLANDE, Langelande**, or **Longland, Robert**, the supposed author of the "Vision of Piers Ploughman," born at Cleobury Mortimer, Shropshire, in the first half of the 14th century. Nothing is known of him except from traditions current at least as early as the 16th century, according to which he was educated

at Oxford, and became a monk at Malvern. The familiarity of the author with the Scriptures and the church fathers indicates that he was an ecclesiastic; several local allusions in the poem, and the fact that its scene is the "Malverne hilles," prove that it was composed on the borders of Wales; and internal evidence fixes its date at about 1362. It narrates the dreams of Piers Ploughman, who, weary of the world, falls asleep beside a stream in a vale among the Malvern hills; and while satirizing in vigorous allegorical descriptions the corruptions in church and state, and the vices incident to the various professions of life, and painting the obstacles which resist the amelioration of mankind, it presents the simple ploughman as the embodiment of virtue and truth, and the representative of the Saviour. Its ancient popularity appears from the large number of MS. copies still extant, most of them belonging to the latter part of the 14th century. It was a favorite of religious and political reformers, and several imitations of it appeared, the most important of which was "Piers Ploughman's Crede," written about 1393 by some Wycliffite, assailing the clergy, and especially the monks. In 1550 the "Vision of Piers Ploughman" was printed by the reformers, and so favorably received that three editions were sold within a year; and the name of the ploughman is often introduced in the political tracts of the 16th and 17th centuries. This poem is a remarkable example of a system of verse derived from the Anglo-Saxons, and marked by a regular alliteration instead of rhyme. There are two classes of manuscripts, which give the text with considerable variations. The best edition both of the "Vision" and the "Creed" is that of Thomas Wright (2d ed., 2 vols., London, 1856), with notes, a glossary, and variations.

**LANGLES, Louis Mathieu**, a French orientalist, born near St. Didier, Aug. 23, 1763, died Jan. 28, 1824. He studied Arabic and Persian under Sylvestre de Sacy, and in 1787 published a French translation from the Persian of Tamerlane's "Political and Military Institutes," supposed to have been written by Tamerlane in the Mongol language. He was intrusted with the publication of the Mantchoo-French lexicon by Father Amiot, which he accomplished with accuracy and success. He induced the French republican government to establish the special school of oriental languages, which is still in existence. He was its first administrator, and professor of the Persian, Malay, and Mantchoo, but taught only the first of these languages. The geographical society of Paris was founded principally through his exertions. He published a great number of works relating to oriental literature, history, and geography, and by his enthusiasm and liberality contributed perhaps more than any other man of his time to the extension of oriental studies. But his learning was confused and inexact, and his works are of little authority.

**LANGLOIS, Jean Charles**, a French painter, born at Beaumont-en-Auge, July 22, 1789, died in Paris in 1870. He was in the army more than 40 years, till 1849, and exhibited panoramas of the principal battles he had witnessed, his "Capture of the Malakoff" especially attracting great attention. He published several military and other narratives.

**LANGLOIS, Victor**, a French orientalist, born in Dieppe, March 20, 1829, died May 14, 1869. He explored Cilicia and Little Armenia in 1852-'3, and the terra cotta figures which he had found in his excavations in the necropolis of Tarsus were exhibited in the Louvre. He discovered more than 80 new Greek inscriptions, and published the results of his researches in four works (1854-'61). In 1857 and in 1861 he went to Italy in search of historical data as to the relations between France and Armenia during the crusades. His other works relate to Egyptian and Georgian numismatics (1852), and to the convent of St. Lazarus and the Mekhitarist congregation, with an outline of Armenian history and literature (1862). In 1867 appeared his *Le mont Athos et ses monastères*, with a photolithographic reproduction of the geography of Ptolemy, of which the Greek manuscript of the 17th century is preserved in that monastery. The first volume of his *Collection des historiens anciens et modernes de l'Arménie*, a translation from the Armenian, was published in 1868, under the auspices of the Egyptian prime minister Nubar Pasha, but he did not live to complete the work.

**LANGRES**, a fortified town of Champagne, France, in the department of Haute-Marne, on the left bank of the Marne, 145 m. S. E. of Paris; pop. in 1866, 8,320. It has a communal college, a commercial court, and a theological seminary. The town is on a steep hill, belonging to the so-called plateau of Langres, and is the most elevated in northern France. The most important manufacture is cutlery. Langres has been the see of a bishop since the 3d century. It is the birthplace of Diderot, to whom a monument has been erected.

**LANGTOFT, Peter**, an English chronicler, so called from the parish of Langtoft in Yorkshire, flourished in the latter half of the 13th century and the commencement of the 14th. Little is known of his life beyond the fact that he was a canon regular of the order of St. Austin, and produced a translation from the Latin into French verse of Bosenham's "Life of Thomas à Becket," and a French metrical "Chronicle of England," from Trojan times to the end of the reign of Edward I. The manuscripts of the latter are preserved in the Cottonian collection in the British museum, and among the Arundel manuscripts in the same repository. The "Chronicle" was rendered into English verse by Robert de Brunne, whose version was edited by Hearne and published in 1725.

**LANGTON, Stephen**, an English prelate, born in Devonshire according to some authors, in

Sussex according to others, about 1160, died in Slindon, Sussex, July 9, 1228. He was educated at the university of Paris, where he had for a fellow student Innocent III., and eventually became canon of Notre Dame and chancellor of the university. Visiting Rome in 1206, he was made a cardinal by Innocent III., and in the succeeding year was consecrated by him archbishop of Canterbury, to which see he had been elected at the recommendation of the pope, and in opposition to the claims of John de Gray, whom King John had compelled the monks of Canterbury to elect. This circumstance gave rise to the quarrel between John and Innocent, one of the consequences of which was that Langton was kept out of his see until the submission of the king to the pope in 1213. In the same year he joined the confederacy of barons opposed to the misgovernment of John, and at a meeting of the heads of the revolt in London urged the restoration of the charter of Henry I. His name also stands first among the subscribing witnesses to Magna Charta. He adhered faithfully to his party throughout the struggle, and for his refusal to excommunicate the barons, at the command of Innocent, was suspended from the exercise of his archiepiscopal functions; but he was restored in February, 1216, and after the accession of Henry III., was allowed to resume the administration of his diocese. From that period he devoted his whole care to church discipline, and published a code of 42 canons in a synod at Oxford in 1222. He still continued to watch over the two charters with the attachment of a parent, and in 1223, at the call of the barons, again placed himself at their head to demand from Henry III. the confirmation of their liberties. His writings have perished; but to him is due the division of the Bible into chapters, since universally adopted.

**LANGUAGE** (Lat. *lingua*, tongue), in a general sense, any means of communicating thought. Man commonly accomplishes it through the organs of sight and hearing, and when these are impaired through the sense of touch. Visible speech is mainly that of gestures and of writing. Gestures are chiefly used by primitive races with whom language is but little developed, and by cultured people to converse with those who cannot hear. The scientific forms of unspoken language have been described in the articles **BLIND**, and **DEAF AND DUMB**. For the unsystematic and pictorial representations of thought, see **HIEROGLYPHICS**; and for the various graphic systems, see **WRITING**. This article treats of language only in the narrower and ordinary sense of oral or articulate speech, and specially of the results of the theoretical study of it. The character and functions of the organs of speech are discussed under **VOICE**.—Language is most commonly studied for practical purposes only, to gain greater assurance and accuracy in the use of one's vernacular, or to acquire the use of other tongues

which afford commercial, social, or literary advantages. The science of language, however, is not simply the study of a language or of languages. Though in a measure grounded on, and to a high degree aided by, a practical knowledge of languages, the science does not include the art of acquiring and imparting languages, to which the name of linguistics is properly confined. Hence it often happens that a great scholar in the science of language is not also a good linguist, or polyglot. There is another method of studying language which, in a narrower sense, does not come within the province of the science of language, namely, philology. In the narrower limitation of the term, as accepted by many recent writers, philology comprehends only scientific researches into the relations of anything expressed by language. The study of language is not its object, but simply a means. It uses language only as a key to the social, moral, intellectual, and religious history of mankind, as preserved in the literary monuments of given nations and ages. Thus classical philology inquires into the culture of Greece and Rome only; oriental philology investigates that of eastern peoples; Germanic philology studies the Germanic or Teutonic races; and so on. Philology, therefore, is thus not confined by the limits of purely linguistic investigation, and is in fact a historical discipline. Many scholars accordingly counsel the disuse of the term "comparative philology" as a designation for the science of language. The term "comparative grammar" is also considered inaccurate, as it indicates rather a division of the science of language. Thus linguistics, philology, and the science of language are conceived as three totally distinct sciences, though of necessity interdependent. Linguistics, as the practical study of languages, dead or living, cannot be treated here, but reference must be made to the numerous articles on the separate languages. Philology, conceived as the science of the culture of a given racial or historical division of mankind, is also too vast and varied for detailed treatment here; and its multifarious subjects of study must be consulted in the articles devoted to each.—The science of language inquires into the origin of language; into the laws of the development of one, or several, or all languages; into the reasons of the diversities or similarities of languages; into the causes of the grammatical and syntactical constructions peculiar to each; and into the relations which various languages hold to each other. The results attained in these classes of inquiries form therefore the subject and order of this article. The origin of language is still, as Prof. Whitney has expressed it, an uncontrollable subject, and other scholars regard it even as an insoluble problem. Many adhere to the belief that language was specially given by God, and hence that there was originally a single perfect language. Some hold that the statements of the Bible do not require such inference, and

maintain, like T. Hewitt Key in his "Language, its Origin and Development" (London, 1874), that "the Mosaic account expressly assigns the immediate invention to Adam." Steintal's objection to the theory of the divine origin of language, namely, that if language had been created in the first human beings, their children could not have gained possession of it, for the reason that what God gives to one as a special endowment no other is able to learn from him, is an argument beyond human reason either to accept or to refute. Benfey says (*Geschichte der Sprachwissenschaft*, &c., Munich, 1869) that the question of the origin of language lies beyond the province of the science of language, and belongs to the natural sciences. He argues that if these establish that mankind is not the offspring of a single human couple, it will be impossible to uphold the doctrine of the original unity of all human speech; and that if they prove that man could not have appeared upon earth otherwise than as a single couple, it will be impossible to establish the original diversity of speech, unless it be assumed that the first human beings were speechless. Many authorities now hold that man was originally speechless, and Jäger, Bleek, Schleicher, Fr. Müller, and others, have recently attempted to explain the origin of language after the Darwinian theory of development. The fact that at least nineteen twentieths of speech is demonstrably man's own work, has led Prof. Whitney to ask ("Language and the Study of Language," New York, 1867), "Why should the remaining twentieth be thought otherwise?" Those who consider language an art handed down and developed from generation to generation, and who hold that in retracing its history we must arrive at a generation which could not speak, nevertheless experience great difficulties in theorizing on the natural causes and the nature of the beginnings of language. The ancients held the theory that words were originally formed by imitations of natural sounds. They called this principle of coining words *onomatopœia*, word-making. (See Lersch, *Sprachphilosophie der Alten*, Bonn, 1838-'41.) It cannot be denied that every language has a stock of words which are imitations of sounds given out by certain things or animate beings. The cuckoo, the peewit, the whip-poor-will of North America, and the tuco-tuco of South America, are irresistible examples of this law. But, says Hewitt Key, here one is at once met by the objection that though such an origin is readily conceived in the case of giving names to living creatures, or to those acts which have their special noise, as scratching, thumping, hissing, yet how can provision be made for terms which belong to the other senses, as for example that of the eye, and still more for the conceptions of the mind? Such objections are not considered unanswerable. The noise *whirr* is believed to serve as a natural symbol of the idea of revolution, and thus the German has *wirren*, to twist, the French

*virer*, the English *veer*, and *to wear* (of a ship). The same sound forms an important part of *whirl*, *whorl*, *world* (the round globe), *warp*, *worm* in the double sense of the wriggling creature so called and the helix of a screw, and *wort* in the sense of root, as spiderwort. It is also heard in the initial letters of *writhe*, *wreath*, *wrench*, *wrest*, *wring*, *wrist*, *wriggle*, *wrap*, *wry*. Similar examples of the recurrence of natural sounds in numerous words expressive of abstract or concrete ideas, seemingly remote from the original ideas connected with such sounds, may be found in all known languages. Of course it is not maintained, as Blackie expressly says in his *Horæ Hellenicæ* (London, 1874), that all current words are to be explained on this principle alone. It is maintained only that the original stock of which language was made up consisted of such roots, and that a large proportion of them, after the changes of thousands of years, bear their origin distinctly on their face. Max Müller ridiculed this view of language, generally known as the mimetic theory, as "the bow-wow theory," without being able to disprove the justice of its application. In his "Lectures on the Science of Language" (London, 1863), he advocates another theory, namely, that man was endowed with a creative faculty which gave to various conceptions phonetic expressions, and hence that there were at first only a few roots of words expressive of general ideas, under which man classified his particular or special ideas, so that such class of words retains in all languages some phonetic type. This mystic doctrine of "phonetic types," first propounded by Heyse, to which for a time, after Max Müller's elaboration, great favor was shown, has now been generally discarded, and even by Max Müller himself. It is evident to every sober thinker, says Wilkins in the "Essays and Addresses by Professors and Lecturers of the Owens College, Manchester" (London, 1874), that the solution of the problem of the origin of language must reside "in some operation of the imitative principle, quickened in all probability by circumstances which we are able to a certain extent to reconstruct, and aided, at first very largely, but always in lessening measure, by the language of sign and gesture." The onomatopoeic or mimetic theory is greatly assisted by, or rather includes, the interjectional or exclamatory theory, elaborated by Wedgwood in his "Origin of Language" (London, 1866). For example, the interjection *fie!* *pfui!* is in all probability the physical effect of disgust at an offensive smell, which makes us close the passage of the nose and breathe strongly through the compressed lips—*faugh!* and hence the Icelandic *fui*, putridity, with the adjective *full*, foul, and our secondary adjective *fulsome*. It has been justly observed that a considerable number of the so-called interjections are but imperatives of verbs, often greatly abbreviated; nevertheless, it must be acknowledged that the mimetic and exclamatory theories

are as yet the only means attained of giving a rational account of the development of language. There remains, however, the difficulty of explaining how, prior to any knowledge of language, man was led to signify his conceptions by spoken words, and to devise such modifications for the purpose as to give rise to the same conceptions in the minds of others equally ignorant of language; but, as Farrar attempts to prove in his work "On the Origin of Language" (London, 1860), it would seem that man is led instinctively to the articulate reproduction of natural sounds, and that the conception that it was possible to express in sound the inward emotions arose from the felt significance of the instinctive and involuntary cries which are the germs of interjections. Similarly, says Bleek in his *Ueber den Ursprung der Sprache* (Weimar, 1868), the sounds of sensations and imitations are natural and involuntary utterances of emotions which are excited by the play of the organs. The lately deceased Lazarus Geiger, in his *Ursprung und Entwicklung der menschlichen Sprache und Vernunft* (Stuttgart, 1868 and 1872), a work of admirable learning and ingenuity, attempts to demonstrate that all words were developed from a single primitive form, analogous to the evolution of the organisms of animals and plants, and to the development of races and peoples. As German and Sanskrit, French and Italian, once formed a single language, and their diversities are due only to the prolonged separation of the peoples, he is led to believe that all the languages of the earth grew out of a single germ, and that the still greater diversities are owing only to more extended periods of separation. Without rejecting the proposition of the mimetic and exclamatory theories that man began to speak by imitating the sounds which he heard animate beings or inanimate objects produce, Geiger is of opinion that man was guided in the selection of utterances by that which he saw, or that he grouped every new sound under some other sound with which he was familiar. He further holds that the use of language in a measure preceded and produced reasoning, or at least that thought without language must have been different from the present mode of thinking by means of and with language. He arrives consequently at the conclusion that man could speak before he was in possession of tools and implements. The interdependence of thought and language, and the independence of the one from the other, have ever been subjects of philosophical discussion, but unproductive of positive results. Hence, linguistic scholars have many theories in regard to the measure and degree of such relationships. Prof. Whitney, for example, holds fast to his conclusion that thought is anterior to language, and independent of it, and that thought need not be internally or externally expressed in order to be thought. This, however, lies beyond the sphere of the science of language proper. Only the development of

language within more or less historical times, based on researches into the condition of real languages either of the present or the past, can admit of truly scientific study. — Etymology is the science of tracing the history of words, and of determining the laws according to which words change form and meaning in the history of a single language, or in a group of related languages, and if possible through all languages, back to the germinal words of the beginnings of speech. Languages change very rapidly. The language spoken in Rome about A. D. 1000 was widely different from the language of the ancient Romans or the modern Italians. The speech of the aborigines of Africa changes so rapidly that, according to the experience of missionaries, that of any particular tribe becomes entirely incomprehensible within a single generation. About 900 languages and 5,000 dialects are now known. The difficulty of deducing for all certain laws of growth and change is therefore apparent. In all languages words have been constructed by putting together previously existing forms of words. Thus, previous to the form *irrevocability*, there was *irrevocable*, which was preceded by *revocable*, which again was formed from *revoke* (Fr. *révoquer*, Latin *revocare*), which, with *evoke*, *invoke*, and *provoke*, was composed from the Latin verb *vocare*, to call, whose element is *voc*. All the suffixes and prefixes employed in the composition of these words have their own distinct meaning and office, and some of them formed at one time independent words. When the final element of a word, like *voc*, in Sanskrit *vak*, has been found, which is the case when a combination of letters has been reached which cannot be further stripped of formative parts, then the so-called root of a word has been obtained. Thus Chinese, though actually possessing about 40,000 words, has only about 450 roots; Hebrew and Sanskrit have about 500 roots; and probably no language has many more. Primary roots consist of only a vowel, as *i*, to go; or of a vowel and consonant, as *ed*, to eat; or of a consonant and vowel, as *du*, to give. Secondary roots have a vowel enclosed by two consonants, as *tud*, to push. Tertiary roots have two consonants followed by a vowel, or one vowel followed by two consonants, or first two consonants, then a vowel followed by another consonant, or two consonants, a vowel, and again two consonants; as *plu*, to flow; *ard*, to hurt; *spás*, to spy; *spand*, to tremble. Out of such simple and few roots not only the words of one but of numerous languages have been formed. Thus from the Sanskrit root *ar* comes the Latin *arare*, Greek *ἀροῦν*, Irish *ar*, Lithuanian *arti*, Russian *orati*, Gothic *arjan*, Anglo-Saxon *erjan*, English *ear* (the verb), and many other words in the same and other languages. Similar examples of the connection existing among the languages related to English and ancient Sanskrit, as well as the laws which seem to regulate the changes of sounds

within this group, have been given in the article GERMANIC RACES AND LANGUAGES. The roots of the Semitic languages (Hebrew, Chaldee, Aramaic, Arabic, and others) generally consist of three or more consonants. Chinese roots have generally but a single consonant followed by one or two vowels. Outside of the Indo-European languages little can be definitely established, as it is requisite, in order to attain positive etymological results, that not a single link in the historical connection between a language discussed and the ancient mother language should be wanting. Reimisch, in his work, *Der einheitliche Ursprung der Sprachen der alten Welt* (Vienna, 1873), has attempted to establish the intrinsic concatenation of the languages of central Africa, Ethiopia, Egypt, Arabia, Syria, and the Aryan family of speech; but there are still many gaps to be filled up to render the subject entirely clear. F. Lenormant's endeavors, in *Études accadiennes* (Paris, 1873 *et seq.*), and in *La magie chez les Chaldéens et les origines accadiennes* (1874), to develop Jules Oppert's opinion that at the basis of some of the oldest Semitic languages, as Elamitic and Assyrian, lie Finnic and Ugrian (or Turanian) strata of languages, are also far from conclusive. Hewitt Key, in his recent work mentioned above, has expressed the opinion that the Indo-European languages are closely connected with the speech of the Finns and Lapps; but this opinion also can hardly be considered substantiated. Nevertheless these works and similar ones, as Delitzsch's *Studien über die indogermanisch-semitische Wurzelverwandtschaft* (Leipzig, 1873), and Donner's *Vergleichendes Wörterbuch der Finnisch-Ugrischen Sprachen* (Helsingfors, 1874), indicate that many scholars perceive that the Indo-European, Semitic, and Turanian groups of languages may possibly have been derived from some one primitive form of speech. The opinions of Lazarus Geiger and other theorists on the origin of language may therefore be finally established by genuine etymological researches. But even if there is hope of an ultimate demonstration of the intrinsic oneness of all human speech, the difficulties still to be overcome are enormous. The phonetic changes which transform words of one language into almost unrecognizable sounds in another, somewhat distantly related, call for most searching examination of the conditions of speech in the various races. The laws of sound are circumscribed by physical conditions. Many languages are entirely devoid of certain sounds; thus the Chinese cannot produce many European utterances, saying Yamelika for America; and the aborigines of the Society islands say Tut instead of Cook. Friedrich von Schlegel asserts that the Aztec language has not the sounds of *b, d, f, g, r, s, j, v*; the Otomi lacks *f, i, k, l, r, s*; the Totonaka lacks *b, d, f, r*; the negroes have no *r*, the Australians no *s*; most Polynesian languages have no sibilants whatever, and others

have only seven consonants, which is the lowest number known. These imperfections and differentiations of the organs of speech render etymological researches exceedingly difficult. The usual alphabets of from 20 to 26 letters admit of the construction of many billions of words, and these letters are far from sufficient to represent the sounds of all languages. The hopelessness of ever building up the complete laws of the phonetic changes occurring in the almost 6,000 languages and dialects known, is further increased by the fact that our knowledge of human speech is confined to historic periods, and that the beginnings of language in prehistoric times, of which no monuments have come down to us, are highly essential to the construction of a satisfactory etymological system. On examining the savage languages now spoken, which many regard as counterparts of the forms of speech used in the childhood of mankind, it is found that the simplest sounds often signify the very opposite in other languages of the same degree of development. The sounds most easily produced, *ba, pa, ma*, and *da*, are generally expressions for father and mother; but what signifies father in one language, signifies mother in another; thus in Georgian *mama* is father, and *dada* mother; and in Tuluva, *amme* father, and *appe* mother. It has long been evident that the mere comparison of words would not be productive of satisfactory results. In fact, the day that Bopp first conceived the idea of bringing the test of the method of inflection to bear upon the question of the affinity and development of tongues, was the real birthday of the science of language.—Grammar is the scientific understanding and explanation of the sounds, forms, and functions of words and their parts, and of the construction of sentences. Comparative grammar seeks, by comparing the grammars of several languages, to reach the laws of inflection and construction common to them, and possibly to all languages. General or historic grammars attempt to explain the growth of language within a specified group of languages. When languages are analyzed in any state already reached, and not in a state of transition, they become the subject of special grammars, belonging to the province of linguistics. Comparative and historical grammars have almost exclusively been written on the Aryan or Indo-European family of speech, enumerated below. It is generally held that the genealogical relation and order of these languages has been demonstrated; and, though conjecturally only, yet with a tolerable degree of certainty, the extinct and primitive languages spoken by the races before separating into new branches have been reconstructed. Johannes Schmidt, in *Die Verwandtschaftsverhältnisse der indogermanischen Sprachen* (Weimar, 1872), objects to the idea of a genealogical tree of the Aryan or Indo-European languages, and proposes in its stead a kind of geographical basis of classification; saying: "You no sooner consign to the

realms of myths the so-called original languages constructed in modern times, such as the European, North-European, Slavo-Germanic, South-European, Græco-Italic or Italo-Celtic, than the mathematical certainty disappears, which was believed to have been already attained for the work of reconstructing the Indo-Germanic mother speech." It is true that there is still much need of argument and illustration to prove the genealogical relationship of the Aryan family of speech; and even August Fick, in *Die ehemalige Spracheinheit der Indogermanen Europas: eine sprachgeschichtliche Untersuchung* (Göttingen, 1873), seems, without sustaining all of Schmidt's premises, to be in favor of revising the order of the branches of the Indo-European tree of languages. Yet without adopting the theory of the concatenation of the Aryan languages, it is impossible to present a just idea of the nature, methods, and results of comparative philology or grammar, or the theoretical study of language. The whole group of those languages is supposed to come from a primitive language of monosyllabic structure; the reason being that all Aryan words can be reduced to roots of single syllables. Grammatically considered, there are two classes of roots: demonstrative or pronominal roots, ultimately indicative of position merely; and predicative or verbal roots, indicative of quality or action. Pronominal roots give rise primarily to demonstrative, personal, and interrogatory pronouns; secondarily to possessives and relatives, adverbs of position and direction, and several minor classes of words. Their number is about 15, all consisting either of a vowel only, or of a vowel preceded by a consonant. The predicative or verbal roots number several hundred, of various compositions of letters, but always forming a single syllable, and indicative of the properties, motions, sounds, &c., of natural objects. The combining of verbal with pronominal roots, for the sake of definiteness of expression, gradually developed various parts of speech. Singular, dual, and plural numbers were invented; prefixes of adverbial elements and repetitions of roots served to render verbal forms, which at first were neither past, present, nor future, but according to connection expressive of either, capable of indicating the various tenses. Interposition of vowels formed the moods, and modifications of roots, compositions with others, or extensions of pronominal endings, produced intensives, desideratives, causatives, and reflexives. Certain derivatives of verbal roots were used as nouns, which again received distinctive suffixes, capable of designating various relations, so-called case endings. On what principle the distinctions of gender were made (for in the oldest forms of language there are masculines, feminines, and neuters which do not depend on sex) is very obscure. In early language all words were either verbs or nouns. Adverbs and prepositions were generated by separating from verbs and nouns various in-

flexional suffixes which served to indicate the relations of time, place, &c. Conjunctions also came very late into existence; the definite articles came from demonstrative pronouns; the indefinite article from the numeral one; and interjections, which should be merely ejaculations without verbal significance, were increased in number by using abbreviated or corrupted words or phrases. The great cause of the varied appearances or pronunciations of words originally the same in the speech of several races, is love of ease in utterance. To economize efforts of voice, long words are abbreviated, and combinations of harsh or difficult sounds are rendered more agreeable and easy by omitting, inserting, or assimilating the letters, or by putting the accent back or forward, or by modifying the tone and length of vowels. The reasons for preferring one form to another are not always exactly definable, but as a rule the linguistic laws of phonetic alteration conform to the physical laws of articulation. The sense or ideas of proportion, rhythm, harmony, euphony, varying in nations of different degrees of culture, are also important factors in the mutations of language. One race abandons elements of speech highly valued by another, makes compounds which another abhors, and retains and adopts what others reject. Thus, while some languages of the Indo-European family continue to conjugate by changes of vowels and consonants, and by affixes, infixes, and suffixes, other languages indicate tenses, moods, and voices in a great measure by separate words. The same is observable in the declension of nouns. Then again words change meaning in the same language in the course of its development, and in passing from one language to another; new words are coined; other words are taken from foreign languages, and some of them are used in a sense they did not possess; others again obtain more than one meaning; some words of originally different significations become synonymous; and synonyms again become anonyms. The causes which produce in different ages and races these numerous significations of the same words, or of derivatives from the same root, have also been analyzed. Comparative grammar goes still further. Various languages have various modes of constructing sentences; words are placed in various relations to each other; they govern various cases; their order or sequence is changed; they combine into so-called idiomatic expressions, which if verbally translated into another language would often appear entirely void of meaning; and these often purely psychological causes have also been investigated. Yet even the grouping of languages into families of speech is far from being conclusive. A. W. von Schlegel proposes three divisions: languages without any grammatical structure, languages that make use of affixes, and inflectional languages. The last he considers superior to the others, and he calls them organic languages,

for the reason that, according to him, they contain a living principle of development and growth, and alone possess, so to speak, an abundant vegetation; in other words, they have the wonderful faculty of forming an endless variety of words, and of marking the connection of ideas which these words denote by means of an inconsiderable number of syllables, which separately considered have no significance, but which precisely define the meaning of the word to which they are attached. Friedrich von Schlegel, in the second place, contends for two main genera of languages, dividing them into those which express secondary ideas by an internal change of the root or inflection, and those which effect the same object by an added word which already in itself expresses the additional idea, whether of plurality, of past or future, or other relation. Bopp again demands three classes: first, monosyllabic languages, which are incapable of composition, and consequently without grammar and organism, as the Chinese; secondly, languages with monosyllabic roots admitting of composition, which are almost exclusively indebted to this power for their organic development or grammar; thirdly, languages with dissyllabic verbal roots, containing three essential consonants on which the fundamental meaning rests, as the Hebrew and Arabic. By many writers, Prichard for example, in his "Eastern Origin of the Keltic Nations" (London, 1831), and Duponceau to whom he refers, the idioms of the American tribes are called polysynthetic or polysyllabic, implying a marked difference from the so-called monosyllabic languages of S. E. Asia. Other writers define some languages as synthetic, as opposed to those which are analytic. Steinthal, in his *Charakteristik der hauptsächlichsten Typen des Sprachbaues* (Berlin, 1860), divides languages into two great classes, culture languages and uncultivated languages, each with the subdivisions, the isolating and the inflecting. Hewitt Key, after stating these distinctions, rightly remarks that all of them seem to be groundless. The assertion that Chinese has a peculiar monosyllabic character, and is devoid of grammatical formation, is founded on a gross error, as is shown in our article CHINA, LANGUAGE AND LITERATURE OF. The alleged distinction between word-building by addition of affixes, and word-building by means of inflection, does not exist. *Domini, domino, dominum* are thus said to be formed from *dominus* by an inflection of *us* into *i, o, um* respectively; but all four forms have proceeded from agglutination of what was a significant syllable in the first place, followed by a compression. Polysynthetic or polysyllabic, applied to the native American languages and the Basque, is an error similar to that committed in the case of Chinese. (See AMERICAN INDIANS, LANGUAGES OF THE.) To all appearance, groups of languages, though clearly and closely related, indicate more than a single type, and are not

surely to be derived from a single primitive tongue, excepting perhaps the languages spoken by the Caffres and Malays, and, but less probably, those of the Papuans and Australians. All other groups seem to be polyglottic, or derived from several root forms of speech in no manner related. It has therefore been attempted to attain a less objectionable classification by combining the results of linguistic and ethnological researches. We have given under ETHNOLOGY (vol. vi., p. 756) the latest classification of racial distinctions, which is equally supported by the relations apparently existing among the various forms of speech. We shall therefore elaborate the same table, with special reference to the labors of the distinguished linguist and ethnologist Friedrich Müller, as given in part in the account of the travels of the Austrian frigate Novara around the world (Vienna, 1868), and in part in the independent work entitled *Allgemeine Ethnographie* (Vienna, 1873). Not in all cases, as will be seen on comparison with the ethnological table, are the linguistic groups entirely the same, and the various subdivisions may be considered as breaks in the line of connection.

- I. Papuan languages. The languages spoken in Papua, by the aborigines of the Sunda islands, and in the Philippines.
- II. Hottentot languages. 1. Nama, Kora, Cape dialect. 2. Bushman tongues.
- III. Caffre or Bantu languages. 1. Eastern group. *a.* Kafir languages: Kafir, Zulu. *b.* Zambesi languages, spoken by the Barotse, Bayeye, and Mashona. *c.* Zanzibar languages: Kisuaheli, Kikamba, Kiuka, Kihia. 2. Central group. *a.* Setchuana (Sesuto, Serolong, Schlapi). *b.* Tsekeza, spoken by the Mankolosi, Matonga, and Mahloenga. 3. Western group. *a.* Banda, Herero, Londa. *b.* Congo, Mpongwe, Dikele, Isubu, and Fernando Po.
- IV. Negro languages. 1. Mandé languages: Mandingo, Bambara, Susu, Vei, Kono, Tere, Gbandi, Londero, Mende, Gbese, Toma, and Mano. 2. Volof language. 3. Felup languages: Felup, Fiham, Bola, Sarrar, Pape, Biáfada, Pajide, Bagé, Kallum, Temme, Bullom, Sherbro, and Kisi. 4. Bijogo. 5. Banyum. 6. Nalu. 7. Bulanda. 8. Limba. 9. Landoma. 10. Somhri. 11. Houssa. 12. Bornoo languages: Kanori, Teda, Munio, Nguuru, and Kanem. 13. Kru languages: Kru and Grebo. 14. Eva languages: Eva, Yoruba, Oji, and Akra. 15. Ibo languages: Ibo and Nupe. 16. Mbafo. 17. Mitchi. 18. Musgu languages: Batta, Musgu, and Logone. 19. Baghirimi. 20. Maba. 21. Nile languages: Bari, Dinka, Nuer, and Shilluk.
- V. Australian languages. 1. Northern division. 2. Southern division. *a.* Western group: languages spoken on the Swan river and King George's sound. *b.* Central group: the Parakalla languages on the Murray river and Encounter bay. *c.* Eastern group: languages near Lake Macquarie, Moreton bay, Kamilaroi, Viraturoi, Vailvun, Kokai, Pikumpul, Paiampa, Kingki, Turrupul, and Tippil. 3. Tasmanian languages.
- VI. Malayo-Polynesian languages. 1. Melanesian languages: language of the Feejee islands, Annatun, Eromangan, Tana, Mallikolo, Lifu, Baladea, Banro, Guadalcana, &c. 2. Polynesian languages. *a.* Samoa, Tonga, Maori, Tahitian, and Karotonga. *b.* Language of the Marquesas islands, and Hawaiian. 3. Malayan languages. *a.* Tagala group: 1, languages spoken on the Philippines—Tagala, Bisaya, Pampanga, Ilocana, and Bicol; 2, languages spoken on the Lardones; 3, Malagasi. 4. Language of Formosa. *b.* Malayo-Javanese group: Malayan, with several dialects, Javanese, Sunda, Madurese, Bughis, Mankasar, Alfuric, Batak, and Dayak.
- VII. Turanian or Mongolian languages. 1. Uralo-Altai languages. *a.* Samoyedic: Yurak, Tavgy, Ostiak-Samoyed, Yenisean, and Kamassin. *b.* Finnic: 1, Suomi and Laplandish; 2, Ostiak, Vogul, and Magyar; 3, Sirian and Votjak; 4, Teheremiss and Morvyn. *c.* Tartaric: 1, Yakut; 2, Turkish and Tchur

- vash; 3, Nogai and Kumuk; 4, Tehagata, Ulgur, and Turkmene; 5, Kirghiz. *d.* Mongolic: 1, eastern language; 2, western language (Kalmuck); 3, northern language (Buriat). *e.* Tungusic: 1, Mantchu; 2, Lamut; 3, Tchapogir. 2. Japanese. 3. Korean. 4. Monosyllabic languages (so named for convenience). *a.* Thibetic and Himalayan languages. *b.* Burmese, Rakhing, and the Lohita languages. *c.* Siamese, Khanti, Khassia, and the language of the Miao-tse. *d.* Anamese. *e.* Chinese: 1, Kwanhoo (dialect of Peking and Nanking); 2, Fukian; 3, Kwangtung (Punti and Hakka dialects). *f.* Isolated languages: Indo-Chinese languages, Talaing, and the languages of the Khamen, Tsiampa, and Kwanto.
- VIII. Language of the Arctic. 1. Yukagir. 2. Koriak, Tehuktehi. 3. Languages of Kamtchatka and of the Kurile islands (Aino). 4. Languages of the Yenisei-Ostiaks and Kotts. 5. Language of the Esquimaux. 6. Language of the Aleutians.
- IX. American languages. 1. Kenai languages. 2. Athabascan languages. *a.* Qualihouqua, Tlatkanai, Umpqua, and Hoopa. *b.* Language of the Apaches, Navajo, Lipans, &c. 3. Algonquin languages: Cree, Ottawa, Ojibway, Micmac, and Mohegan. 4. Iroquois languages: Onondaga, Seneca, Oneida, Cayuga, and Tuscarora. 5. Dakota language. 6. Pani. 7. Appalachee languages: Natchez, Muscogee, Choctaw, and Cherokee. 8. Languages on the N. W. coast: Koloshes and Nootka. 9. Oregon languages: Atna, Selish, Chinook, Calapooya, Wallawalla, and Sahaptin. 10. Californian languages: Cochimi and Pericu. 11. Yuma languages. 12. Isolated languages of Sonora and Texas: language of the Pueblos. 13. Isolated languages of Mexican aborigines. 14. Aztec languages: Mexican (Nahuatl) and Sonoga languages. 15. Maya languages: Maya and Huasteca. 16. Isolated languages of Central America and the Antilles. 17. Caribbean languages: Caribbean and Arrawakan. 18. Tupi languages: Tupi and Guarani. 19. Isolated languages of the Andes. 20. Araucanian. 21. Guaycuru-Abitonian. 22. Puelche. 23. Tehuelhetic. 24. Pesharar. 25. Chibcha. 26. Quichua languages: Quichua and Aymara.
- X. Dravidian languages. 1. Munda languages: language of the Kol, Ho, Santals, &c. 2. Dralaya languages: Tamil, Telugu, Tulu, Canarese, Malayalam, &c. 3. Cingalese (Elu).
- XI. Nubian languages. 1. Foolah languages: Futatoro, Foota-Jallon, Masena, Borgoo, and Sackatoo. 2. Nuba languages: Nubi, Dongolavi, Tumale, Koldagi, and Konjara.
- XII. Languages of the Mediterranean races. 1. Basque. 2. Caucasian languages. *a.* Lesghian, Avar, Kasikumuk. *b.* Circassian, Abkhasian. *c.* Kistie (Tush). *d.* Georgian, Lazish, Mingrelian, and Suanian. 3. Semitic languages. *a.* Hamitic languages: 1, Libyan group (Ta-Masheg); 2, Ethiopic group (Bedsha, Somaui, Dankali, Galla); 3, Egyptian group (ancient and modern Egyptian or Coptic). *b.* Semitic languages: 1, northern group—Chaldee, Syriac, Hebrew, Samaritan, Phenician; 2, southern group—Ethiopic, Tigre, Amharic, Hinyaritic, Arabic. 4. Aryan or Indo-European languages. *a.* Indian group: 1, old Indie (Sanskrit), Pali, Prakrit; 2, modern Indian languages—Bengali, Assami, Oriya, Nepaulose, Cashmerian, Sindhi, Punjabi, Hindustani, Gujarati, Marathi; 3, language of the Sijaposh, Dardu tribes, and gypsies. *b.* Iranian group: 1, old Persian, Pehlvi, Parsi, modern Persian and its dialects, Kurdish, Beluchi; 2, Zend, Afghan; 3, Osetian; 4, Armenian. *c.* Celtic group: Welsh, Gaelic. *d.* Italic group: Etruscan (?), Umbrie, Oscan, Latin, and the Romance languages (Italian, Spanish, Portuguese, French, Rhaeto-Romanic, Rouman). *e.* Thracio-Ilyrian group: Albanese. *f.* Greek group: ancient and modern Greek. *g.* Letto-Slavic group: 1, Slavic languages—old Slavic, Bulgarian, Serb, Slovenish, Russian, Polish, Polabie, Bohemian; 2, old Prussian languages—Lithuanian, Lettish. *h.* Germanic languages: Gothic, High German, Low German, Anglo-Saxon, English, Frisian, Flemish, Dutch, Icelandic, Swedish, and Danish.

**LANGUEDOC**, an ancient province of southern France, bounded N. by Lyonnais, E. by Dauphiny and Provence, from which it was separated by the Rhône, S. E. by the Mediterranean, S. by Roussillon and Foix, W. by Gascony and Guienne, and N. W. by Auvergne. It was distinguished into Languedoc proper,

comprising Haut-Languedoc, Bas-Languedoc, and the Cévennes, and the annexed provinces, Vivarais, Velay, Gevaudan, Albigeois, and part of Quercy. It nearly corresponds to the Gallia Narbonnensis of the Romans. The Visigoths took possession of it in the 5th century, calling it the kingdom of Gothia, and in the 8th it was occupied by the Saracens, who were expelled by Charles Martel and Pépin the Short. Charlemagne made of it the duchy of Septimania, the rulers of which made themselves independent; and in the 10th century it became the county of Toulouse. A part of it was ceded to the French crown in 1229, and the province was definitely united with France in 1271. The parliament sat at Toulouse, and the assembly of notables at Montpellier. The name Languedoc was formed from *langue d'oc*, *oc* being the word used by the inhabitants for *oui*, and distinguishing them from those N. of the Loire, who used *oil* (*langue d'oil*). It now forms the departments of Aude, Tarn, Hérault, Lozère, Ardèche, and Gard, and parts of Haute-Garonne and Haute-Loire.

**LANIGAN, John**, an Irish clergyman, born in Cashel in 1758, died at Finglas, near Dublin, July 7, 1828. About the age of 16 he entered the Irish college at Rome, where he took orders and received the degree of D. D. He was soon afterward appointed to the chair of Hebrew, divinity, and the Scriptures at Pavia; and when the university was deserted in 1796 in consequence of the war, he returned to Ireland and was elected to a similar position in the college of Maynooth. His election having been opposed by the bishop of Cork, who suspected him of Gallicanism, he refused the professorship, and obtained an appointment in the record tower of Dublin castle, to which were added in 1799 the duties of librarian, editor, and translator for the Dublin society. This place he retained till 1821, when his intellect became impaired, and he passed the rest of his life in a private lunatic asylum at Finglas. He left an "Introduction concerning the Nature, Present State, and True Interests of the Church of England, and on the Means of effecting a Reconciliation of the Churches," and an "Ecclesiastical History of Ireland" (4 vols., 1822). He also published the Roman breviary in Irish, and an edition of Alban Butler's "Moral Discourses," with a preface.

**LANJUINAIS, Jean Denis**, count, a French statesman, born in Rennes, March 12, 1753, died in Paris, Jan. 13, 1827. When scarcely 22 years of age he won by public competition the professorship of ecclesiastical law in his native city. He acquired reputation as a lecturer and a barrister, was in 1789 elected a deputy to the states general, took an active part in nearly all the great measures of the constituent assembly, framed the bill for the civil constitution of the French clergy, and was the first mover of a plan afterward adopted and embodied in the civil code, by which the registration of births, marriages, and deaths was to

be transferred from ecclesiastics to municipal officers. In 1792, being sent to the convention, he resisted the extreme measures of the revolutionists, and opposed the proceedings against Louis XVI., and, being obliged to participate in the trial, voted for his confinement and subsequent banishment. He sided with the Girondists, and was arrested on June 2, 1793, but escaped to Rennes. He resumed his seat as a deputy in 1795, and became president of the convention. On the organization of the directory he was elected to the council of the ancients by 73 departments. After the 18th Brumaire he was appointed a member of the senate, opposed the consulate for life and the establishment of the empire, received nevertheless the title of count from Napoleon, and was one of the members who voted for the deposition of the emperor in 1814. He was made a peer by Louis XVIII., submitted to Napoleon when he returned from Elba, presided over the chamber of deputies during the hundred days, and on the second restoration resumed his seat in the chamber of peers. Here he advocated liberal opinions, opposing the reactionary measures of the Villèle ministry and the growing influence of the clergy. He was acquainted with the oriental languages, entered the academy of inscriptions in 1808, became afterward a member of the Asiatic society of Paris, and was elected associate of the philosophical society of Philadelphia. His works have been published in 4 vols. 8vo (Paris, 1832).

**LANKESTER, Edwin**, an English physician, born at Melton, April 23, 1814, died in October, 1874. He studied in London and at Heidelberg, and was lecturer and professor at prominent institutions from 1843 to 1862, when he became coroner for central Middlesex. His works, besides numerous contributions to scientific periodicals and cyclopædias, include "Vegetable Physiology" (1868), "A School Manual of Health" (1869), and "What shall we Teach? or Physiology in Schools" (1870). He edited in 1866 the "Journal of Social Science."

**LANNER.** See FALCON.

**LANNES, Jean**, duke of Montebello, a marshal of France, born at Lectoure, Guienne, April 11, 1769, died in Vienna, May 31, 1809. He was apprenticed at 15 years of age to a dyer, but in 1792 entered the army, and soon attained the rank of *chef de brigade*. In 1795 he was included among the officers whom the report of the committee charged with reorganizing the army recommended to be dropped from the service; but disdaining an inactive life, he followed Bonaparte to Italy in 1796 as a volunteer, and distinguished himself at Millesimo, at Fombio, at the bridge of Lodi, and at the assault of Pavia, and was made a brigadier general. At the beginning of the battle of Arcole, Nov. 15, he was wounded; but learning that the combat had been renewed before the bridge, he mounted his horse, and plunging into the thickest of the fight was struck senseless by a

ball while urging on the troops. In two months he was again in the field, and participated in some of the most important achievements of the campaign of 1797. He followed Bonaparte to Egypt in 1798, and fought with distinction at Gaza, Jaffa, St. Jean d'Acre, and Aboukir. At the last named place he was severely wounded while storming a redoubt. Returning to France, he contributed greatly to the success of the 18th Brumaire, and received the command of the consular guard; and in the spring of 1800 he took command of the advanced guard of the army with which Napoleon entered Italy over the St. Bernard, and he ended a series of brilliant achievements by completely defeating the Austrians at Montebello, whence he subsequently received his ducal title. At Marengo he sustained for seven hours the attacks of the Austrian army supported by a powerful train of artillery, and was presented with a sword and selected to present to the French government the standards taken from the Austrians. In 1801 he was sent to Lisbon as minister plenipotentiary, but showed in this capacity so arbitrary and rapacious a disposition and so little of diplomatic finesse, that he was recalled. In 1804 he was created a marshal of the empire, and in 1805 accompanied Napoleon to the Austrian campaign. He was present at Wertingen, Ulm, and Braunau, and occupied Linz; and at Austerlitz he had two aides killed by his side. He was actively employed in the campaign of 1806 against the Prussians, and at the battle of Jena commanded the centre. He subsequently participated in the campaign against the Russians, terminating at the battle of Friedland, June 14, 1807. In 1808 he accompanied the emperor into Spain, and, having defeated Castaños and Palafox at Tudela, conducted the siege of Saragossa, which after a protracted defence, memorable alike for the heroic endurance of the inhabitants and the energy and skill of the French marshal, capitulated Feb. 21, 1809. He was almost immediately summoned to Germany, where the campaign of 1809 had already commenced. At Eckmühl, April 22, his services mainly contributed to the successful issue of the battle; and at the assault on Ratisbon on the succeeding day he signaled himself by one of those daring acts for which he was conspicuous even among Napoleon's generals. Seeing that his men hesitated to enter the breach under a heavy fire from the ramparts, he seized a scaling ladder and led them in through a storm of shot, thereby carrying the place in a few minutes. The sanguinary battles of Aspern and Essling, May 21 and 22, witnessed the termination of his career. On the 21st he held the village of Essling against the repeated attacks of the Austrians. On the succeeding day he led an immense column of infantry, artillery, and cavalry against the Austrian centre, but was forced back toward the bridge connecting the left bank of the Danube with the island of Lobau, whither the

French were soon in full retreat. To animate his men, he dismounted, and stationed himself in the front ranks. At that moment a cannon ball carried away his right leg, and the foot and ankle of his left. As he was borne from the field, he encountered the emperor, who, kneeling by his litter, embraced him with tears, and showed an unusual degree of emotion. After nine days he expired in Vienna, whither he had been removed soon after the battle. A statue of Lannes was erected in his native place after the revolution of July, 1830.—His son, NAPOLÉON LANNES DE MONTEBELLO, duke, born July 30, 1801, was made a peer by Louis XVIII., but took his seat only after the accession of Louis Philippe, who employed him in the diplomatic service. In 1847-'8 he was minister of marine. In 1849 he was elected to the legislative assembly, in 1858 sent as ambassador to Russia, and in 1864 made a senator. He died July 20, 1874.

**LA NOUE, François de**, a French soldier, born near Nantes in 1531, died near Lamballe, Aug. 4, 1591. He belonged to an illustrious family of Brittany, was converted to the reformed religion by D'Andelot, a brother of Coligni, and became one of the most valiant soldiers of the Huguenot army under Condé, distinguishing himself at Dreux, Orleans, and Poitiers, and being captured for the second time at Moncontour (1569). The cardinal de Lorraine declined to exchange him for Strozzi, remarking that they had a number of Strozzi, but that the Protestants had only one La Noue. He was however soon released. At the siege of Fontenay-le-Comte, in 1570, he lost his left arm, which was replaced by one of iron, whence his sobriquet of *bras de fer*. He took Valenciennes in 1571, but was obliged to capitulate at Mons in the following year. After a futile attempt to negotiate with the inhabitants of La Rochelle in behalf of Charles IX., he was during four years at the head of the Protestant army. On the restoration of peace he went to Flanders (1578) as grand field marshal in the service of the Low Countries, where after various successes he was captured by the Spaniards and held a prisoner five years. In 1585 he was exchanged for Philippe Egmont, on condition that his son should remain as a hostage in the custody of the duke of Lorraine. Subsequently he distinguished himself by fresh exploits under Henry IV., who exclaimed, on hearing that La Noue had died of wounds received at the siege of Lamballe, that France had lost in him not only a great warrior, but a man who was still greater by his virtues and humanity; and even a Roman Catholic historian compared him to the chevalier Bayard. He occupied an eminent place in French literature, as one of the finest prose writers of his day. His principal work, *Discours politiques et militaires* (Basel, 1587), has passed through many editions, and been translated into German and English. His correspondence was edited by Kervyn de Volkaersbeke (Ghent and Paris, 1854).

**LANSAC, François Émile**, a French painter, born at Tulle in 1805. He studied under Langlois and Ary Scheffer, and excels in painting horses and equestrian pictures. His "Olivier de Clisson" and "Napoleon I." are at Versailles. His other principal works are "Horses at Liberty" and "English Terrier" (1857), "The Death of Ravenswood" (1861), "Charles II." (1864), "The Broken Girth" (1868), and "A Russian Team" (1869).

**LANSDOWNE. I. William Petty**, first marquiss of, better known as the earl of Shelburne, a British statesman, born May 2, 1737, died May 2, 1805. In early life he entered the army, and served with distinction under Prince Ferdinand in the seven years' war. Upon the death of his father in 1761, he took his seat in the house of lords; and upon the formation of the Grenville ministry in April, 1763, he was appointed president of the board of trade, with a seat in the cabinet, although he was not then 26 years of age. In this capacity he distinguished himself by a conciliatory policy toward America, and by his opposition to the plans proposed for taxing the colonies, thereby incurring the hostility of the king and of his colleagues. Upon the remodelling of the cabinet in September he resigned office, and thenceforth attached himself to the policy and fortunes of Mr. Pitt, who, upon assuming the reins of government in 1766, made him secretary of state for the southern department, which included the colonies. He here renewed his endeavors to remove all causes of complaint between the colonies and the mother country, but was constantly thwarted by Townshend, the duke of Grafton, and others of his colleagues, who during the illness of Pitt, now become earl of Chatham, had acquired a predominating influence in the cabinet. Not choosing to resign until he could advise with Chatham, he was dismissed by the king in October, 1768; and thenceforth, during the Grafton and North administrations, he proved himself one of the ablest and most active opponents of the ministry in the upper house. Upon the resignation of Lord North in March, 1782, he took office under the marquiss of Rockingham; and upon the death of the latter in July of that year he was intrusted by the king with the formation of a new ministry. The new premier had to encounter the opposition of the Fox party, who were disappointed that the duke of Portland had not received office; and the coalition between these and the adherents of Lord North compelled him to resign in February, 1783. But during the seven months that he held office the defence of Gibraltar and the victories of Hood and Rodney added lustre to the British arms; and the preliminaries for peace with America and for the acknowledgment of the independence of the United States were concluded, notwithstanding he had joined Lord Chatham in expressing the strongest disapprobation of the latter measure. From this period he withdrew almost wholly from public life. In 1784 he was

created marquis of Lansdowne. Lord Shelburne was considered one of the most liberal and accomplished statesmen of his time, and probably carried out more fully than any of his contemporaries the principles inculcated by the elder Pitt. **II. Henry Petty-Fitzmaurice**, third marquis of, second son of the preceding, born July 2, 1780, died Jan. 31, 1863. He was educated at Westminster, Edinburgh, and Trinity college, Cambridge, where he graduated in 1801. Upon coming of age, being then known as Lord Henry Petty, he entered parliament for the borough of Calne, succeeded to the representation of Cambridge university on the death of Mr. Pitt, and under Grenville and Fox (1806-'7) was chancellor of the exchequer. He supported the leading measures of the liberal party, but retired with his colleagues in 1807; and succeeding to his title two years later, on the demise of his brother, he became one of the whig leaders in the house of lords. He was an earnest advocate of Catholic emancipation and the abolition of slavery, and was one of the first to urge the necessity of parliamentary reform and free trade. After 20 years' exclusion from a participation in the administration of public affairs, he was in 1827 home secretary both under Canning and in the short-lived cabinet of Viscount Goderich; was president of the council in Earl Grey's ministry from November, 1830, till November, 1834, and in Melbourne's from April, 1835, till September, 1841. He accepted the same office again under Lord John Russell's administration in July, 1846, and held it till February, 1852. Upon the formation of the Aberdeen cabinet in the succeeding December he accepted a seat in the cabinet without office, which he occupied till February, 1858, when he retired from public life.

**LANSING**, a city and the capital of Michigan, in Ingham co., on Grand river, here spanned by an iron and two wooden bridges, 85 m. N. W. of Detroit; lat.  $42^{\circ} 46' 28''$  N., lon.  $84^{\circ} 32' 40''$  W.; pop. in 1850, 1,229; in 1860, 3,074; in 1870, 5,241; in 1874, 7,442. It is regularly laid out, with wide streets crossing each other at right angles and lighted with gas. The state house is a large, plain frame building, mostly erected in 1849; a three-story brick structure, for the temporary accommodation of some of the state officers, was built in 1871. A new state house,

to be completed in 1877, at a cost of \$1,200,000, is in course of construction. This edifice is to be of iron and stone, in the Palladian style of architecture, four stories high, with basement, 345 ft. in length, not including the porticos, and 191 ft. deep. The state reform school occupies a farm of 139 acres in the E. part of the city, and has about 200 inmates. It has four brick buildings, the central one being 48 ft. long, 56 ft. deep, and four stories high, with two wings extending north and south, each 95 ft. long, 33 ft. deep, and three stories high, and a third extending east, 83 ft. long, 30 ft. deep, and three stories high. The state agricultural college occupies a farm of 676 acres, 3 m. E. of the city limits. The buildings, four in number, stand upon a slight eminence amid forest trees; the grounds immediately around have been handsomely laid out. It was chartered in

New State Capitol at Lansing, Michigan.

1855, and subsequently received the congressional land grant to the state for an agricultural college. The number of students in 1873 was 143. The odd fellows' institute, for the care and education of orphans of the order, in the N. W. extremity of the city, was organized in 1871. It occupies a tract of 45 acres and a brick building (since enlarged) formerly used as a female college, and has a library of 1,500 volumes. At the mouth of Cedar river in the southern portion of the city is an artesian well, yielding mineral water of medicinal properties. Lansing is well supplied with railroads, four lines centering here, viz.: the Jackson, Lansing, and Saginaw; Detroit, Lansing, and Lake Michigan; Peninsular; and Lake Shore and Michigan Southern. It is surrounded by a fertile country, abounding in timber and coal, and has an important and in-

creasing trade. The river affords water power, which has as yet been but little utilized. The principal manufactories are three of sash, doors, and blinds, two of chairs, one of spokes, felloes, and bent work, two of barrels, three of iron work, including agricultural implements, sewing machines, and steam engines, several saw mills, a flouring mill, and a woollen mill. There are two national banks with a capital of \$175,000, and an insurance company with \$100,000 capital. The public schools are graded, including a high school department, and in 1873 had 27 teachers and 1,050 pupils. The Michigan homeopathic college, open to both sexes, is situated here. The state library has more than 20,000 volumes, the public school library about 500, and that of the Lansing library and literary association about 1,000. Two weekly newspapers are published, and there are 15 churches, viz.: Baptist, Congregational, Episcopal, Freewill Baptist, Lutheran, German Evangelical Lutheran, Methodist (5), Presbyterian (2), Roman Catholic, and Universalist.—Lansing was made the seat of government in 1847, when its settlement was barely begun, and was incorporated as a city in 1859.

**LANSINGBURGH**, a village of Rensselaer co., New York, on the E. bank of the Hudson river, opposite the mouth of the Mohawk, and joining Troy on the south; pop. in 1870, 6,372. It has communication with Troy by the Troy and Boston railroad and by horse cars, and by the latter with Waterford, 1 m. N. on the other side of the river. It is handsomely laid out, with streets crossing each other at right angles and shaded with trees, and has an excellent fire department. Besides a large number of brush factories, for which Lansingburgh is particularly noted, there are two manufactories of oil cloth, one of valves, two of crackers, and one of knit goods. It has a national bank, five hotels, three public schools, a female seminary, a Roman Catholic school, a weekly newspaper, and seven churches.

**LANTERN FLY.** See **FIREFLY**.

**LANTHANUM**, or **Lanthanum** (Gr. *λανθάνειν*, to lie hid), a metal discovered in 1841 by Mosander, who then separated it from the metal didymium, with which it was associated together with cerium in the mineral cerite; symbol, La; chemical equivalent, 92. It forms only one oxide, which is buff-colored and freely soluble in diluted nitric acid. It forms colorless astringent salts, which give a white precipitate with the soluble oxalates.

**LANUVIUM** (now *Cività Lavigna*), an ancient city of Italy, in Latium, 18 m. S. S. E. of Rome, about a mile from the Appian way. It was founded at a very remote period, and probably by a colony from Alba. It took part with Rome against the Volscians, but later, in the wars of the Latins, against the Romans. Subsequently it was celebrated for its temple of Juno Sospita. It suffered greatly in the civil wars. The emperor Antoninus Pius was born here. Few remains of the old city now exist.

**LANZA, Giovanni**, an Italian statesman, born at Vignale, Piedmont, in 1815. He became a member of the Sardinian chamber in 1848, and of Cavour's cabinet as minister of education in 1855, and of finance in 1858. He withdrew with Cavour in 1859, and was repeatedly president of the Sardinian chamber and the Italian parliament. In 1864-'5 he was minister of the interior under Lamarmora, and he executed the transfer of the capital of Italy to Florence. In 1867 he was again president of the parliament, but resigned in consequence of his objections to the financial measures of the government. His reelection to the presidency in 1869 occasioned the resignation of the Menabrea cabinet, and the king called upon him to form a new one, in which he took the portfolio of the interior. The transfer of the capital to Rome, July 1, 1871, took place under his administration, and he projected beneficial financial measures. His cabinet, resigning June 26, 1873, was succeeded, after a protracted crisis, by that of Minghetti.

**LANZAROTE**, the most N. E. of the Canary islands, in lat. 29° 2' N., lon. 13° 48' W., 90 m. from the African coast; length 36 m., average breadth 9 m.; area, about 325 sq. m.; pop. in 1867, 17,500. The mountains are all of volcanic origin, and the principal peak, *Montana Blanca*, is upward of 2,000 ft. high; the most conspicuous of the active volcanoes is *Temanfay*. Small rocky islands abound on the N. E. and E. coast. The decomposed lava which composes the soil of the low hills and large plains makes it exceedingly fertile in rainy years, but the generally prevailing drought is often fatal to vegetation. In good years the product of wine amounts to 1,500 pipes. The other staple articles are various cereals. *Teguise* is the residence of the governor, and *Arecife* is the principal port, free since 1852. The total value of imports in 1872 was £22,614, and 83 vessels entered and cleared, tonnage 16,947. The exports to England amounted to £12,585.

**LANZI, Luigi**, an Italian author, born at Monte dell'Almo, near Fermo, June 14, 1732, died in Florence, March 30, 1810. He was educated by his father and at the Jesuit college in Fermo. He entered the order in 1749, and taught in their schools. After studying theology at Rome for four years, he was professor of the humanities in several colleges. Upon the suppression of the Jesuits in 1773, he was appointed assistant director of the gallery of Florence. He studied the Etruscan language and antiquities, making several journeys to collect materials. In 1790 he was appointed archæologist of the grand duke, in consequence of his *Saggio di lingua etrusca*. He now devoted himself altogether to archæological and artistic researches. Toward the close of his life he wrote several devotional books. His most important works are: *Descrizione della galleria di Firenze* (Pisa, 1782); *Saggio di lingua etrusca* (Rome, 1789); and *Storia pittorica della Italia* (6 vols., Florence, 1792), a work

which he undertook at the suggestion of Tiraboschi, the historian of Italian literature. No general history of Italian painting had previously appeared, and the histories of particular schools were too strongly marked by bias and prejudice to be of any general value. Lanzi's work was the first comprehensive treatise in which the history of each school is given according to its several epochs, and the first written in a philosophical and impartial spirit. Several editions were published in the author's lifetime, each of which received numerous additions and revisions from his hand. It has been translated into various languages, and is familiar to English readers through the excellent version of Thomas Roscoe, which forms 3 vols. of Bohn's "Standard Library." Lanzi also published a collection of dissertations on Etruscan vases; a book of Latin poems written by himself; a treatise on the ancient Italic languages; a translation of Hesiod's "Works and Days" in *terza rima*; and *Opere sacre*, a series of treatises on spiritual subjects, to which he is said to have attached more importance than to any of his other writings.

**LAOCOÖN**, a Trojan hero, generally represented as the son of Antenor, and a priest of Apollo or Neptune. While the Trojans were assembled round the wooden horse of the Greeks, deliberating whether they should admit it into their city, Laocoön rushed forward, warned them not to receive it, and struck his spear into its side. As a punishment for his impiety toward an object consecrated to Minerva, two monstrous serpents attacked him

and his two sons while preparing to sacrifice in the temple of Neptune, and, coiling themselves round the bodies of the three, crushed them to death. This legend was a favorite subject with the poets and artists of ancient Greece. The story is related by Virgil, and a celebrated group of sculpture representing Laocoön and his sons encoiled by the serpents, and suffering the agonies of strangulation, is still extant, and is said by Pliny to have been the work of the Rhodian statuary, Agesander, Polydorus, and Athenodorus. It was discovered at Rome in 1506, and purchased by Pope Julius II., who placed it in the Vatican, where it still remains. The Laocoön group has been made the subject of admirable art criticism by both Winckelmann and Lessing; by the latter in the celebrated work on art entitled *Laokoön*.

**LAODAMIA**, a mythical Grecian princess, daughter of Acastus and wife of Protesilaus, a Thessalian hero, who, having led his warriors against Troy, was the first Greek slain on the Asian shore. His disconsolate spouse entreated the gods to permit her to hold converse with her husband for only three hours. The request was granted, and Mercury conducted Protesilaus back to the upper world; but when he was forced to return, Laodamia, unable to endure separation from him, expired. The legend is embodied in one of Wordsworth's finest poems.

**LAODICEA**, in ancient geography, the name of six Greek cities in Asia, situated in Phrygia, Syria, Lycaonia, Coelesyria, Media, and Mesopotamia, founded by Seleucus Nicator, the first king of Syria, and some of his successors.

Ruins of Laodicea.

Two deserve particular notice. **I. Laodicea on the Lyens**, a tributary of the Mæander in the S. W. corner of Phrygia, which, however, was claimed by some earlier writers as part of Lydia and Caria. It received its name from Laodice, the queen of Antiochus Theos, its founder. It passed from the kings of Syria to those of Pergamus, and under the Romans, though frequently visited by destructive earthquakes, became one of the most flourishing and

opulent cities of Asia Minor. It was destroyed in 1402 by Tamerlane. Its luxury in the early times of Christianity is attested by the severe rebuke addressed to its inhabitants in the Apocalypse. Paul addressed an epistle to the Christians of Laodicea. (See **EPHESIANS, EPISTLE TO THE**.) The town of Eski-Hissar was built by the Turks on its site. **II. Laodicea on the Seacoast**, a maritime city of Syria, 50 m. S. by W. of Antioch, founded by Seleu-

ous Nicator, and named after his mother. It was renowned for the fertility of its wine-growing environs, its splendor, and the excellence of its harbor. In the later period of the Syrian empire it became almost independent, and it suffered greatly during the civil war after the death of Cæsar, when it stood a siege against the Cassians. It was rewarded by Antony with exemption from taxes, and adorned by Herod the Great with an aqueduct, the ruins of which, with other remnants of its ancient greatness, are still to be seen. During the middle ages it suffered from the attacks of the Moslems. Its site is now occupied by the Turkish city of Latakia. (See LATAKIA.)

**LAOMEDON.** See TROY.

**LAON** (anc. *Lugdunum Clavatum*, and *Bibrax Suessorum*; mediæval Lat. *Laudunum*), a fortified city of France, capital of the department of Aisne, 74 m. N. E. of Paris; pop. in 1872, 10,268. It is mainly built on a steep isolated hill shaped like a V, and thought by many to be the Mons Bibrax mentioned by Cæsar. On one arm of the V stand the modern citadel and the city proper enclosed by old fortifications; on the other is a Jesuit residence, the remaining portion of the once magnificent monastery of St. Vincent. Of the populous suburbs which once extended all round the foot of the mountain, only two small villages now remain. The cathedral was burned about 1112, and rebuilt in 1114. It formerly had six towers and a central dome over the transept, of which only the two western towers and one at the S. E. angle of the transept remain entire. The western front has recently been restored at an expense of 2,000,000 francs. Of the four other churches within the walls, two are also of the 12th century, one being a church of the knights templars. The city has a library of 20,000 volumes, with a collection of more than 2,000 rare autographs, a museum filled with Gallo-Roman and Celtic antiquities, a communal college, and a normal school. It is an emporium for the manufactures of St. Quentin, St. Gobain, and Follenbray; and has an active trade in nails, hats, woollen stuffs, and hosiery, besides corn, white poppy oil, and garden stuffs. In the suburbs are thriving potteries, tan yards, lime kilns, rope walks, and a manufactory of coppers. —Laon became the residence of Queen Brunehaut in 575, and the French kings frequently resided there till the accession of the house of Capet in 987. It has a famous school, in which Anselm of Canterbury and Abélard taught for some time. During the middle ages the burgesses maintained a long and bloody struggle for communal rights with the bishop and chapter. Since the time of Cæsar Laon has sustained many sieges. It held out against Henry IV. in 1590, but was taken by him in 1594; was alternately occupied by the allies and Napoleon in 1814 and 1815, its environs being the scene of important engagements in

March of the former year (see BLÜCHER, vol. ii, pp. 755-'6); and on Sept. 9, 1870, capitulated to the Germans. On the last occasion, just as the German troops were marching in, a French soldier blew up the powder magazine, killing and wounding several hundred persons.

**LAOS**, a country of Asia, in Indo-China or Further India, bounded by China, Anam, Siam, and Burmah, and extending from about lat. 16° to 23° N., though its limits are not closely defined; pop. estimated at about 1,500,000. It is traversed by the Mekong or Cambodia river, and is separated from Burmah by the Salwen. The surface appears to be a valley lying between two nearly parallel ranges which run along the N. E. and S. W. frontiers. The soil is fertile, and produces rice, tobacco, the sugar cane, indigo, benzoin, gums, teak, sapan and sandal woods, betel, and numerous fruits. Elephants and draught cattle are the principal animals, and valuable mines of tin and iron are said to exist, while gold is washed from the sands of the rivers, and copper, lead, emeralds, and rubies are also found. The Laos are an honest but indolent race, much addicted to the study of magic, and resembling in religion, customs, and language the Burmese. They are skillful workers in metal, and make mats, paper (from bark), leather, pottery, silk and woollen fabrics, sugar, and gunpowder. They have a trade with the British settlements in Indo-China, and with Tonquin. Most of the tribes are dependent upon Siam. The first Christian mission among the Laos was commenced in 1867 at Chieng May, about 500 m. N. of Bangkok, by the Presbyterian church in the United States.

**LAO-TSE.** See CHINA, vol. iv., p. 454.

**LA PAZ.** I. A W. department of Bolivia, bordering on Peru; area, 43,051 sq. m.; pop. in 1865, 519,465, about nine tenths of whom were Aymaras. The face of the country is extremely diversified, comprising some of the loftiest mountains (Illimani, Sorata, &c.) and deepest valleys on the American continent; while from the first descend most of the streams which unite to form the Rio Beni, one of the principal affluents of the Amazon. The soil is extremely fertile, and the vegetation varied and luxuriant. Fine timber and cabinet woods abound. Maize, wheat, and the other cereals are plentifully produced in almost all parts. Cotton, indigo, the sugar cane, tobacco, cacao, coffee, ginger, and pimento, with the several tropical fruits, are the chief productions of the valleys; while in the more elevated regions potatoes, *chuño* (a species of potato brought to market frozen and dried), *quinœa* (often used as a substitute for the two last), and the various fruits and many of the vegetables of the temperate zone are very plentiful. The coca plant is everywhere cultivated, and is the object of an extensive commerce. Cattle, horses, mules, sheep, and hogs are raised in prodigious numbers; vicuñas, alpacas, llamas, and guanacos are extremely

abundant, as are also jaguars, pumas, foxes, vizcachas, and monkeys. The vampire is common and destructive of cattle. Gold and silver are found in several places; but the chief mineral wealth of La Paz is derived from the copper mines of Corocoro. The celebrated Lake Titicaca is partly situated on the W. border of the department, a large portion of which is watered by the Rio Desaguadero, carrying the waters of this lake to that of Aullagas in Oruro. The department is also remarkable for the ancient ruins of Tiaguanaco, near the village of that name on the borders of Titicaca, and attesting the high civilization of a people anterior to the incas (probably the Aymaras). **II. La Paz de Ayacucho**, a city, capital of the department, in lat.  $16^{\circ} 30' S.$ , lon.  $68^{\circ} 30' W.$ , about 300 m. N. N. W. of Sucre; pop. in 1865, 83,092, nine tenths Aymaras. It is about 13,000 ft. above the sea level, built in amphitheatre in a deep valley formed by the Chuquiapo, a torrent which descends from the neighboring peak of Illimani, rising 8,000 ft. higher, and is here crossed by nine handsome bridges. The streets are not very regular, but the houses are substantially constructed, the lower part frequently of stone, and have a neat and agreeable appearance. The cathedral, fronting the principal square, is a beautiful edifice, tastefully decorated outside with bassi rilievi, and possessing a magnificent image of the Virgin of the Pilar of Saragossa, the gift of Charles V. Of the 14 other churches, some have much architectural beauty. There is a monastery, the university of San Andrés, a school of medicine, and a number of other schools public and private, besides the college of law, sciences, and arts, and a seminary. The *alameda* is a delightful resort for promenading; and the cemetery or *panteon* is surpassed in beauty by very few in South America. La Paz is the chief commercial emporium of the republic, owing to its situation almost due E. of the Peruvian port of Arica, which is in reality the most convenient for Bolivia. There is no industry of importance, and the principal trade consists in the traffic in coca leaves, and the export of copper extracted from the extensive mines of Corocoro in the vicinity. A curious commodity daily received in the markets is *taquia*, the dried excrements of the llama and its congeners, constituting the chief fuel used in the country.—The city was founded in 1543 by Alonzo de Mendoza, who named it Nuestra Señora de la Paz. In 1605 it was raised to a bishopric; and in 1825 it received its present appellation of La Paz de Ayacucho, in memory of the battle fought in the plain of the last name, decisive of Bolivian independence.

**LA PAZ**, a seaport of Mexico, capital of the territory of Lower California, on a bay of the same name, on the W. shore of the gulf of California, 240 m. N. W. of Mazatlan; lat.  $24^{\circ} 15' N.$ , lon.  $110^{\circ} 12' W.$ ; pop. about 500. Many of the houses show in their tasteful construction

that the town was once the abode of luxury. The port is well sheltered, and easily defensible against attack from the sea. But the shipping is now almost insignificant; and the pearl fisheries, once very extensive and productive, have lost much of their importance. The climate is hot and insalubrious, and the surrounding country is for the most part barren; yet there are numerous ranchos at some distance in the interior, exporting fruits and animal products.

**LAPEER**, a S. E. county of Michigan, drained by the sources of Flint and Belle rivers; area, 828 sq. m.; pop. in 1870, 21,345. It has a rolling surface and a rich soil, and is well wooded. The Port Huron and Lake Michigan, and the Detroit and Bay City railroads pass through it. The chief productions in 1870 were 357,521 bushels of wheat, 241,266 of Indian corn, 300,735 of oats, 37,585 of barley, 152,984 of potatoes, 33,650 lbs. of hops, 241,179 of wool, 646,757 of butter, 29,365 of cheese, and 29,835 tons of hay. There were 4,973 horses, 5,301 milch cows, 1,011 working oxen, 6,346 other cattle, 52,191 sheep, and 6,793 swine; 4 manufactories of carriages, 2 of iron castings, 1 of engines and boilers, 7 of saddlery and harness, 3 of sash, doors, and blinds, 1 of woollen goods, 11 flour mills, and 30 saw mills. Capital, Lapeer.

**LA PÉROUSE**, Jean François de Galaup, count de, a French navigator, born at Guo, near Albi, Languedoc, Aug. 22, 1741, perished probably by shipwreck at Vanikoro, an island in the South Pacific, in 1788 or 1789. He entered the navy at the age of 15, and in 1759 was wounded and taken prisoner in the engagement with Sir Edward Hawke off Belle Isle. Subsequently he served in the American war of independence, and in 1782 entered Hudson bay with a small fleet and destroyed the British trading establishments there. Upon the conclusion of the war Louis XVI., with a view of securing for the French people a share in the glory which the English were reaping from the discoveries of navigators like Cook, caused the frigates *Astrolabe* and *Boussole* to be fitted out under the command of La Pérouse for maritime explorations in the Pacific, and along the coasts of America, China, Japan, and Tartary. La Pérouse, sailing from Brest, Aug. 1, 1785, doubled Cape Horn and proceeded to the N. W. coast of America. From Mount St. Elias he explored the coast as far as Monterey, California, whence he crossed over to Asia. During the summer of 1787 he followed the coast from Manila to Petropavlovsk, at which place he arrived in September, having examined the waters which separate the coast of Tartary from the Japanese group of islands, and discovered the straits between the islands of Saghalien and Yezo which bear his name. From Petropavlovsk he sent to France copies of his journals and charts and other data, from which an account of his voyage was subsequently prepared. Sailing south in the latter part of September, he touched at Manua, one

of the Navigator's islands, where De Langle, the commander of the *Astrolabe*, and a number of men were killed by the natives, and thence proceeded to Botany Bay. A letter from La Pérouse to the French minister of marine, dated Botany Bay, Feb. 7, 1788, announcing his intention of proceeding to the isle of France by the way of Van Diemen's Land, the Friendly isles, and New Guinea, was the last intelligence ever received from the expedition. In 1791 a squadron was despatched under Admiral D'Entrecasteaux in search of La Pérouse, but failed of finding any trace of him. Dumont d'Urville while at Hobart Town in 1828 learned that fragments of a shipwrecked vessel and her equipments had been discovered in Vanikoro in the New Hebrides group, and sailing thither with his vessel the *Astrolabe*, ascertained that many years previous two ships had foundered on a reef off the W. coast of the island, and that such of the crews as had not been drowned or murdered by the savages had sailed from the island in a small vessel built by themselves, and never afterward been heard of. Believing that these were the ships of La Pérouse, he caused a cenotaph to be erected near the locality of the shipwreck.

**LAPHAM**, Increase Allen, an American physicist, born at Palmyra, N. Y., March 7, 1811. He was engaged as a civil engineer on the Welland canal, in Canada, and afterward on the canal around the falls of the Ohio at Louisville, Ky., where he began the collection of his herbarium, which now contains about 8,000 specimens. From 1833 to 1835 he was secretary of the Ohio board of canal commissioners. In 1836 he removed to Milwaukee, Wis., where he now resides, and where he has held several municipal and other offices. In 1862 he was elected president of the Wisconsin historical society. In 1873 he was appointed state geologist, and in 1874 was engaged in making a thorough geological and topographical survey of Wisconsin. He has been a frequent contributor to scientific periodicals, and was the first to demonstrate from minute personal observations that there is a slight lunar tide in Lake Huron. Among his productions are: "Notice of the Louisville Canal, and of the Geology of the Vicinity" (in Silliman's "Journal," 1827); "Wisconsin: its Geography, Topography, History, Geology, and Mineralogy" (1844; 2d ed., 1855); a "Geological Map of Wisconsin" (1855); and "Antiquities of Wisconsin" (in the "Smithsonian Contributions," vol. vii., 1855). In 1867 he made a valuable report to the legislature of Wisconsin upon the disastrous effects of the destruction of forest trees; and in 1869 he presented a memorial to congress suggesting that system of weather reports which has since been adopted.

**LAPIDARY** (Lat. *lapidarius*, a stone cutter, from *lapis*, a stone), a workman whose trade is the cutting and polishing of small ornamental stones. His apparatus consists almost exclusively of wheels or disks for grinding down,

slitting, and polishing the faces of minerals. These are of a few inches diameter, made of lead, pewter, brass, or iron, and of various soft alloys, and some used for smoothing the softest minerals are of willow or mahogany. The metal wheels are called laps. The term mill is applied to them all, and some are distinguished as slitting mills, others as roughing, smoothing, or polishing mills, of all which there are varieties adapted to the different degrees of hardness of the minerals. The polishing mill for the softest stones is formed of a coil of list, wound with the edges outward; it is also sometimes made of bristles like a brush, or of wood covered with buff leather. For slitting purposes an iron disk is employed of 8 or 9 in. diameter and  $\frac{2}{3}$  of an inch in thickness. The various disks used by the lapidary are adjusted to a vertical spindle, and one of them is set in the table or lapidary's bench, so as to revolve horizontally just above the surface. Its axis extends beneath the table, and is there connected by a belt with a driving wheel attached to another vertical axis, which also passes through the table and terminates above in a winch

Lapidary's Table.

or crank. This is turned with the left hand while the stone is guided upon the mill with the right. The mills are fed with moistened diamond powder or emery and water; and as the hard powder imbeds itself in the soft metal, this becomes merely the medium for holding the abrading material, and the softer substance apparently grinds and cuts the harder objects that are applied to it. A raised edge around the table prevents the dispersion of the diamond powder or emery. Close to the mill is a round iron rest set in the table, which can be turned nearer to or further from the disk. This is for supporting the arm of the workman in holding the stone to the wheel; or, when its upright extremity is capped with a wooden socket, which is perforated with a number of holes, it serves to retain at any desired angle a stick upon the end of which is cemented the stone to be ground in facets. By this contrivance the exact inclination required is given to the faces of ornamental stones. Diamond powder for the mills is prepared by grinding the waste particles in steel mortars till they lose their sparkling appearance. It is applied mixed with olive or sperm oil. The slitting mill is

charged with it around the extreme edge, and it is carefully renewed as required. It is more economical for this use, and applied to the surfaces of other mills for grinding the facets of hard stones, than emery; but the latter powder with water is employed for the more common class of stones. It is used of various degrees of fineness, and in such quantity that there shall always be a loose portion of it between the stone and the metallic surface of the lap. Polishing is effected by successively using finer and finer powders. The hardest small stones are finished on laps of copper or of pewter, and others on lead, and the powder used is rotten stone, which is plentifully applied with water. To make it adhere, the face of the metal is hacked in lines with the edge of a knife. For very soft stones, as alabaster, after these are smoothed upon a lead or wood mill with flour emery, the list mill is employed with pumice stone and water, and after this the buff leather disk with fine putty powder and water. The last polish is sometimes given with the hand and putty powder.—In the East Indies, wheels and rubbers are made of corundum or emery imbedded in lac resin. For the former about one third of the bulk is lac resin and two thirds is the powder. This is carefully stirred, a little at a time, into the melted resin; the mass is then kneaded and rolled upon a stone slab upon which fine corundum powder is sprinkled, and finally it is flattened into a disk with an iron rolling pin. The wheels are made of different degrees of fineness, and when used are set upon a horizontal axis, which the workman, sitting on the ground, causes to revolve with a spring bow, holding the stone in his left hand against the wheel, which is occasionally moistened and sprinkled with corundum powder. The rubbers contain a much smaller proportion of corundum; and the finest have intermixed the grindings of agates, carnelians, &c. Grindstones are used for giving shape to gems only in the works at Oberstein on the Nahe in Germany, where agates are fashioned into the form of various articles, as buttons, clasps, stamps, paper weights, mortars for chemical purposes, &c. Stones of large size are run by water power, and the workmen lie down in front of them when at work, the body being supported by a sort of stool. They acquire wonderful dexterity in giving the shape they desire to the hard stones, and produce with extraordinary rapidity playing marbles of perfectly globular form.—For full details of the processes of the lapidary, vol. iii. of Holtzapffel's "Mechanical Manipulations" may be consulted; also "A Popular Treatise on Gems" (New York, 1859-'67), by Dr. L. Feuchtwanger, and "Diamonds and Precious Stones" (New York, 1874), translated from the French of Louis Dieulaufait by F. Sanford. (See also DIAMOND, and GEM.)

**LAPIS LAZULI**, Lazulite, Ultramarine, or Blue Spar, a mineral distinguished for its beautiful azure-blue color, highly esteemed as an orna-

mental stone. It is commonly obtained of massive form, and of compact or granular structure. Crystals, which are rare, are 12-sided; a fine specimen of the regular dodecahedron with mirror-like faces is contained in the collection of the French school of mines. The mineral is a silicate of soda, lime, and alumina, with a sulphide, probably of iron and sodium. The analyses give variable results. That by Clément and Desormes, the first of those below, is regarded as giving the true composition; by following it, artificial ultramarine, a pigment formerly prepared directly from the mineral, has been successfully manufactured. The fourth, by Varrentrapp, is of an artificial ultramarine. The second analysis is by Klaproth, and the third by Varrentrapp, as given by Dufrénoy (*Minéralogie*):

CONSTITUENTS.	1.	2.	3.	4.
Silica .....	35·8	46·0	46·50	45·604
Alumina .....	34·8	14·5	31·76	23·304
Soda .....	23·2	...	9·09	21·476
Carb. lime.....	3·1	25·0	8·52	1·752

Loss .....	...	2·0	1·09	Lime, } 0·021
Total.....	100·0	100·0	100·00	98·735

The hardness of the mineral is 5·5; specific gravity 2·38, crystals 2·959. When melted by the blowpipe it loses its blue color; but a variety from Chili recovers it on cooling after calcination. Lapis lazuli occurs in calcareous rocks, associated and sometimes mixed with mica and iron pyrites. It is brought from Persia, China, Lake Baikal in Siberia, Bokhara, and recently from Chili and California. In trade it is known as the Armenian stone. The principal use of the stone has been for making the blue ultramarine pigment; and as from the best stone only 2 to 3 per cent. can be obtained, the cost of the purest article is sometimes over \$100 an ounce. The artificial preparations, however, are now very generally substituted. (See ULTRAMARINE.) Lapis lazuli was employed by the ancient gem engravers, and the fine specimens have ranked among choice jewels. The stones through which the mineral is disseminated are carved into many ornamental objects, as vases, snuff boxes, cups, and even architectural ornaments. In the Orloff palace at St. Petersburg are apartments lined with lapis lazuli. Imitations of it are made of bone ashes colored with oxide of cobalt.

**LAPITHÆ**, in Grecian legends, a people of the mountains of Thessaly, descended from Lapithes, the son of Apollo and Stilbe. They were governed by Pirithous, the son of Ixion, and are famous for their battles with the centaurs, who, being likewise sons of Ixion, claimed a share in their father's kingdom. The wars having been closed by a peace, Pirithous

invited the centaurs to a feast on occasion of his marriage with Hippodamia; but, heated with wine and urged on by Mars, they attempted to carry off the bride and other women, whereupon a conflict ensued, in which the Lapithæ were victorious. The story is related by Hesiod and Ovid. The Lapithæ were probably a Pelasgian people, whose conquest of some less civilized tribe originated the classic fable. To them is ascribed the invention of bits and bridles.

**LAPITO, Louis Auguste**, a French painter, born at St. Maur, near Paris, in 1805, died in Boulogne, April 7, 1874. He studied in Paris under Watelet and Heim, and in foreign countries, and became a distinguished landscape painter. Many of his works are in French, Belgian, and Dutch collections. One of the finest of them, in the Palais d'Orsay, was destroyed in the burning of that building during the commune (1871).

**LAPLACE, Cyrille Pierre Théodore**, a French navigator, born at sea, Nov. 7, 1793. He early entered the navy, became captain in 1828, and commanded in two expeditions of circumnavigation, which he described in his *Voyage autour du monde par les mers de l'Inde et de la Chine, exécuté sur la corvette de l'État la Favorite pendant les années 1830, 1831 et 1832* (5 vols., Paris, 1833-'9), and in his *Campagne de circumnavigation de la frégate l'Artemise pendant les années 1837, 1838, 1839 et 1840* (4 vols., 1845-'8). He was made vice admiral in 1853, and retired in 1858.

**LAPLACE, Pierre Simon**, marquis de, a French astronomer and mathematician, born at Beaumont-en-Auge, Lower Normandy, March 23, 1749, died in Paris, March 5, 1827. Of the events of his early life he seldom spoke after he had attained rank and distinctions, but he is known to have been of humble origin, and to have been enabled by the assistance of rich friends to study at the college of Caen and at the military school of Beaumont, whence at the age of 18 he went to Paris with letters of introduction to D'Alembert and others. D'Alembert at first took no notice of him; but receiving from him a remarkable paper on the general principles of mechanics, he at once interested himself in behalf of the young stranger, and by his influence procured him in 1768 or 1769 a professorship of mathematics in the military school of Paris. Thenceforth for more than half a century Laplace devoted himself to the pursuit of science with an ardor and industry productive of the most beneficial results, and which his participation in public business and politics never seriously interrupted. In 1773, when he was barely 24 years of age, his papers on the calculus and various astronomical questions, read before the academy of sciences, procured his admission into that body as an associate. A few years later he became examiner of the pupils of the royal artillery corps, and in 1785 he was elected a member of the academy of sciences. He subsequently lec-

tured on analysis at the normal school, served in the board of longitude, and presented to the council of 500 a report of the proceedings of the institute from its establishment. The revolution drew him into the sphere of politics, in which he accomplished nothing worthy of his fame, and in which the ignoble traits of his character were prominently displayed. At first he appears to have been a radical republican, and it is said that in 1796 he was one of a deputation who were presented at the bar of the council of 500 to swear eternal hatred to royalty. Two years later he paid his court to Gen. Bonaparte, fresh from his Italian campaigns, thus securing his election to the institute; and after the overthrow of the directory he was intrusted by the first consul with the department of the interior. So little capacity did he display in this office, however, that within six weeks he was superseded by Lucien Bonaparte, being appointed to a seat in the senate. Napoleon in his exile at St. Helena, with more point than justice, complained that Laplace "carried the spirit of the infinitesimal calculus into the management of business." In fact, the department was then one of the most difficult in France to manage, and a more experienced statesman than Laplace might have failed to discharge its functions properly. Under Napoleon he was made vice president and chancellor of the senate, a count of the empire, an officer of the legion of honor, and was the recipient of many other distinctions. He nevertheless turned against his benefactor when misfortunes overtook him, voted for his deposition in 1814, and was rewarded by Louis XVIII. with the title of marquis. He also suppressed in the second edition of his *Théorie des probabilités* (Paris, 1814) the dedication to "Napoleon the Great," contained in the edition of 1812, in which, as in the dedication to vol. iii. of the *Mécanique céleste*, of which he did not live to publish a second edition, he had expressed himself under lasting obligations to Napoleon for numerous benefits. During the hundred days he refrained from presenting himself at the Tuileries, and after the second restoration of the Bourbons his employments were chiefly of a scientific character, the most important being the presidency of the commission for reorganizing the polytechnic school, and that of the academy of sciences.—As a physicist Laplace occupies a position second to that of no mathematical philosopher since Newton, and to his labors the science of astronomy owes the discovery of the invariability of the major axes of the planetary orbits, and of the great inequality of the motions of Jupiter and Saturn, the settlement of the problem of the acceleration of the mean motion of the moon, the theory of Jupiter's satellites, and other important laws. In his knowledge of physical principles he was probably superior to any contemporary analyst; and his invention, in conjunction with Lavoisier, of the calorimeter for measuring the capacities of bodies for

heat, his discovery of the cause of the discrepancy between the theoretical and observed velocity of sound, his rules for barometrical measurement, and his theories regarding capillary attraction, tides, and atmospheric refraction, show that in some of the most important branches of general physics his mind was not less actively and profitably employed than in mathematical analysis. The crowning glory of his scientific career was his *Mécanique céleste*, a book which has been truly said to have had no predecessor, and which must wait for a second Laplace to arise ere it finds a rival. In it he sought to digest on a uniform scientific basis the abundant materials relating to the application of analysis to physical astronomy, which had been accumulating during nearly a century, and which, written in various languages, with differing notations and in various stages of scientific progress, presented a mass of matter not only difficult of access, but almost incomprehensible to any but the most recondite student. The result of his labors appeared in 16 books, published in 5 vols. 4to, with four supplements, between 1799 and 1825, and arranged as follows:—vol. i.: book i., "On the General Laws of the Equilibrium of Motion;" book ii., "On the Law of Universal Gravitation and the Motion of the Centres of Gravity of the Heavenly Bodies;"—vol. ii.: book iii., "On the Figure of the Heavenly Bodies;" book iv., "On the Oscillations of the Sea and the Atmosphere;" book v., "On the Motions of the Heavenly Bodies around their Proper Centres of Gravity" (Paris, 1799; re-published in 1829-'30);—vol. iii.: book vi., "On the Theory of the Planetary Motions;" book vii., "On the Theory of the Moon," and supplement i., "On the two great Inequalities of Jupiter and Saturn" (Paris, 1804);—vol. iv.: book viii., "On the Theory of the Satellites of Jupiter, Saturn, and Uranus;" book ix., "On the Theory of Comets;" book x., "On different Points relative to the System of the World," and supplements ii. and iii., comprising the "Theory of Capillary Action" (Paris, 1805);—vol. v.: book xi., "On the Figure and Rotation of the Earth;" book xii., "On the Attraction and Repulsion of Spheres, and the Laws of the Equilibrium and Motion of Elastic Fluids;" book xiii., "On the Oscillation of the Fluids which cover the Planets;" book xiv., "On the Motions of the Heavenly Bodies around their Centres of Gravity;" book xv., "On the Motions of the Planets and Comets;" book xvi., "On the Motions of the Satellites," and supplement iv., "On the Development in Series of the Radical which expresses the Mutual Distance of two Planets" (Paris, 1823-'5). "Within this immense programme," says Professor Nicol, "placed as if parenthetically, one finds the most striking notices on almost every important problem of mechanical physics, any one of which would have made the fortune of an ordinary mathematician." In consequence, however, of his almost total neglect to refer to

the labors of his predecessors or contemporaries in this, and indeed in all his works, it is difficult for the student to know how much of it belongs to Laplace and how much to others; and he has therefore, not without apparent reason, been sometimes considered more of a compiler than a discoverer. The name of Lagrange, his great contemporary and friend, is rarely mentioned, and one of the latter's finest analytic discoveries is on one occasion cursorily referred to as "the formula No. 21 of the second book of the *Mécanique céleste*." In like manner the claims of Taylor and Maclaurin to the theorems passing under their names are ignored, while his references to himself are innumerable. With all needful restorations and acknowledgments, however, almost any one of the original researches of Laplace contained in the *Mécanique céleste* is sufficient to stamp him as one of the greatest of mathematicians. The only translation of this work is that by Dr. Bowditch of Salem, Mass., with full commentaries, published at Boston. (See BOWDITCH, NATHANIEL.) Mrs. Somerville's "Mechanism of the Heavens" is a summary of a portion of the work. Laplace's remaining works consist of his *Théorie analytique des probabilités*, the most mathematically profound treatise on the subject which has yet appeared, and containing his celebrated method for the approximation to the values of definite integrals (Paris, 1812; 3d ed., 1820, with four supplements); his *Exposition du système du monde* (2 vols. 8vo, 1796; 6th ed., containing a eulogium on the author by Baron Fourier, 4to, 1835), "a *résumé* of all modern astronomy, unsurpassed for perspicuity and elegance in any scientific literature," translated by Prof. Pond; and over 40 important memoirs, principally on astronomical subjects, published between 1772 and 1823. Of the three works above named, an edition in 7 vols. 4to (Paris, 1843-'7) was published under government auspices. He died after a short illness. It is commonly related that his last words were: "What we know is of small amount; what we do not know is enormous." But De Morgan states, apparently with authority, that the last words of the great astronomer were different. During his illness, says De Morgan, "he thought much on the great problems of existence, and often muttered to himself, *Qu'est ce que c'est que tout cela!* After many alternations, he appeared at last so permanently prostrated that his family applied to his favorite pupil, Poisson, to try to get a word from him. Poisson paid a visit, and after a few words of salutation said: 'I have good news for you. A letter has been received at the bureau of longitudes from Germany, announcing that M. Bessel has verified by observation your theoretical discoveries upon the satellites of Jupiter.' Laplace opened his eyes and answered with deep gravity: 'Man pursues nothing but chimeras.' He never spoke again." He has been accused of holding materialistic views; but his writings give no evidence of a

tendency in that direction, and the subject is one which he is known to have avoided. As a scientific writer he was perspicuous and elegant, and his *Système du monde*, as a specimen of style, is called by Arago "one of the most perfect monuments of the French language."

**LAPLAND** (Lappish, *Sameanda* and *Somellada*), the land inhabited by the Lapps, the northernmost portion of the Scandinavian peninsula and the European continent, comprised in Norway, Sweden, and Russia. It constitutes portions of the Norwegian provinces of Tromsø and Drontheim, of the Swedish läns of Norrbotten and Westerbotten, and of the Russian governments of Uleaborg in Finland and Archangel. On the north is the Arctic ocean, east the White sea, and south the gulf of Bothnia. The coasts are indented with numerous bays, and faced with small islands. Near the gulf of Bothnia the surface of the country is a plain covered chiefly with forests of spruce and fir. The ground then rises gradually, terminating in lofty peaks of rock, exceeding in certain places 6,000 ft. in height. The descent from these ridges to the Arctic ocean is more abrupt than that toward the south. The limit of perpetual frost is 3,500 ft., so that there are many summits half a mile above the snow line. The rest of the surface is generally rocky, and, except in a few favored spots like the valley of the Alten, displays little vegetation besides sturdy forests and a few stunted bushes and perennial moss. There are many lakes, among them the Enare and Imandra, connected with the sea by streams, which are inconsiderable in autumn and winter, but become large rivers in the spring. The most important watercourses are the Tornea, Kemi, Kalix, Lulea, Pitea, Umea, Tana, and Alten. The climate is much milder on the seacoast than in the interior, and owing to the Gulf stream many of the northern fiords never freeze. The mean annual temperature at Cape North is about 30° F. In winter the sun is for many weeks below the horizon, and in midsummer there are weeks of continuous day.—Of the 160,000 inhabitants of Lapland, only about 15,000 or 20,000 are Lapps (in their own language, *Sabme* or *Sam*), who form a subdivision of the Finnic race. (See FINNS.) They were originally inhabitants of Finland, but were gradually pushed by the Finns further north and west to their present territory. According as they are fishermen or reindeer herdsman, they are distinguished as "sea Lapps" and "mountain Lapps," and either occupy settled habitations or lead a nomadic life. They are extremely small in stature, and their hair is black and straight, presenting a great contrast to the tall and blond Norwegians and Swedes. Their skin is yellow, the forehead broad, the head poised on a short and round neck, the nose well formed, the cheek bones protruding, the chin pointed, the cheeks hollow, and the lips straight and thin. They are agile, but quickly exhausted by labor, rather from bodily weakness than

laziness. They dress in furs, with trousers and shoes of reindeer skin. They protect the head by means of a sort of cowl, but the Russian Lapps generally wear fur caps with ear covers. The dwellings of the mountain Lapps are small tents, consisting of a skeleton of bent sticks, covered with a coarse cloth. In the middle is a hole which serves as a flue for the fireplace underneath. The sea Lapps have better habitations, generally consisting of wooden huts with several apartments. They live exclusively on animal food; bread, which they obtain of Russian tradesmen, is considered a delicacy. The women are very skilful in making garments, and the men cut out of wood with astonishing ingenuity, considering the imperfect tools they employ, all the utensils they need. Many still hunt with bow and arrow, but some of them have gained possession of guns. Polygamy, though not prohibited by custom, is very rare on account of the high price which has to be paid for women. The daughter of a rich man costs sometimes as much as 100 reindeer, while a poor girl is seldom sold for less than 20. The price is considered as a repayment of the expenses incurred in bringing up a daughter, and also as a remuneration to the father for losing her services. The Lapps have been converted to Christianity, and belong to the Lutheran church in Norway and Sweden, and to the Greek church in Russia. When heathens, they worshipped five orders of divinities: supercelestial, celestial, atmospheric, manes, and demons. Radien Athzie, the highest god, created everything; he was assisted by Ruona Neid, the fruitful virgin; and his son Radien Kiedde kept the world in order. A great god was Storyunkare, the lord of beasts, of the chase, and of fishing. Tiermes brought sometimes weal, and sometimes woe; he carried the hammer; his bow was the rainbow, and in his wrath he slew men and beasts with lightning. His symbol was a rude block of wood, which no female durst approach. The magicians of the Lapps prophesied by means of a drum, on which they painted the images of the gods and of things about which inquiry was made; having slept with this under his head, the magician on awaking told what he had seen in his dreams.—The Lappish language is related to Finnish, but has of late incorporated many Swedish words. There are several dialects of it. Nouns possess no grammatical gender, but the singular and plural are distinguished, and in several cases also the dual number. There are 11 cases, and the degrees of comparison for adjectives. The first ten numerals are *akta*, *kvekte*, *kalm*, *nelye*, *vita*, *kota*, *kyetya*, *kaktse*, *äktse*, and *lokke*. Ordinal numbers are formed by adding *at*. The verbs have causative, diminutive, intensive, inchoative, and several other forms, as well as special forms for negation. Postpositions take the place of prepositions.—See Henrik Helms, *Lapland und die Lappländer* (Leipsic, 1868); Pettersen,

*Lapland* (Stockholm, 1871); and Hermann and Karl Auel, *Ein Polar Sommer: Reise nach Lapland* (Leipsic, 1874).

**LA PLATA**, a S. W. county of Colorado, formed in 1874 from portions of Conejos, Lake, and Saguache counties; area, about 7,000 sq. m. It borders on Utah and New Mexico, and is watered in the north by the Rio Dolores and the Rio San Miguel, and by the Uncompahgre river, a tributary of the Gunnison. In the south it is drained by the Mancos, La Plata, Las Animas, and Los Pinos, tributaries of the San Juan. The Rio Grande rises in the E. part. The county contains the Sierra San Miguel mountains, and is traversed from S. W. to N. E. by the Sierra La Plata range. A strip 20 m. wide along the Utah border, and 15 m. wide along the New Mexico border, is occupied by the Ute Indian reservation. Valuable gold mines have recently been discovered in this county, and large numbers of miners are resorting thither. Capital, Howardsville.

**LA PLATA.** See ARGENTINE REPUBLIC.

**LA PLATA, Rio de.** See PLATA, RIO DE LA.

**LAPONNERAYE, Albert**, a French historian, born in Tours, May 8, 1808, died in Marseilles in September, 1849. He established a school and a journal at Marseilles. The government became so alarmed at the popular effect of his lectures in 1831 on the history of the French revolution, that he was not permitted to continue them, and he was several times arrested on account of his liberal writings. His works include *Cours public d'histoire de France depuis 1789 jusqu'en 1830* (1831-'4); *Histoire de la révolution française depuis 1789 jusqu'en 1840* (3 vols., 1840); an edition of Robespierre's writings (3 vols., 1842); and *Histoire universelle depuis les premiers âges du monde* (8 vols., 1845-'6), left unfinished.

**LA PORTE**, a N. W. county of Indiana, bordering on Michigan and Lake Michigan, and drained by Kankakee, Little Kankakee, and Gallien rivers; area, 450 sq. m.; pop. in 1870, 27,062. The surface consists partly of rolling prairies, interspersed with groves of timber; the soil is generally fertile. It is traversed by five important railroads. The chief productions in 1870 were 519,018 bushels of wheat, 394,294 of Indian corn, 148,311 of oats, 151,812 of potatoes, 47,277 lbs. of wool, 320,766 of butter, and 22,333 tons of hay. There were 7,297 horses, 6,135 milch cows, 9,435 other cattle, 15,031 sheep, and 15,386 swine; 3 manufactories of agricultural implements, 2 of brick, 8 of carriages, 2 of iron castings, 6 of saddlery and harness, 6 of tin, copper, and sheet-iron ware, 2 of woollen goods, 2 breweries, 8 flour mills, and 12 saw mills. Capital, La Porte.

**LA PORTE**, a city and the county seat of La Porte co., Indiana, situated on the border of a beautiful and fertile prairie, 12 m. from Lake Michigan and 135 m. N. by W. of Indianapolis; pop. in 1850, 1,824; in 1860, 5,028; in 1870, 6,581. It is at the junction of the Lake Shore and Michigan Southern railroad with the In-

dianapolis, Peru, and Chicago line, and is a place of considerable trade. It contains founderies and machine shops, manufactories of agricultural implements, flouring, saw, and planing mills, &c., five banks, good public schools, a public library, a semi-weekly and two weekly newspapers, and 17 churches. A chain of seven beautiful lakes runs N. of the city, which from their facilities for boating and bathing are a favorite summer resort.

**LAPPENBERG, Johann Martin**, a German historian, born in Hamburg, July 30, 1794, died Nov. 28, 1865. The son of a physician, he was sent to study medicine at Edinburgh, but applied himself to historical and political researches. After visiting the highlands and the Hebrides, he went to London, where he studied the English government and constitution. He continued his legal studies at Berlin and Göttingen, and received the degree of doctor in 1816. He was sent by the senate of Hamburg during the congress of Troppau as minister resident to the Prussian court, and resided in Berlin till in 1823 he was appointed to the charge of the archives of Hamburg. In this office he discovered many valuable historical memoirs that were supposed to be lost, among which were the records of the old cathedral of Hamburg. He also made an important collection of diplomatic notes in a journey through the north of Europe. In 1848 he became a member of the senate. In 1850 he took part as plenipotentiary in the negotiations at Frankfurt, which ended with the pacification of Germany by the convention of Olmütz. Many of his historical works relate to the antiquities of the Hanse towns, especially Hamburg, and of northern Germany. Among them are: *Urkundliche Geschichte des Ursprungs der Deutschen Hansa* (2 vols., Hamburg, 1830), a continuation of the work of Sartorius; *Die Geschichte Helgolands* (1831); *Hamburgisches Urkundenbuch* (1842); *Die Elbkarte des Melchior Lorchs* (1847); and *Hamburger Chroniken* (1852-'61). His most remarkable work is the *Geschichte von England* (2 vols., Hamburg, 1834-'7), continued by Pauli (2 vols., 1853-'5), and translated into English by Benjamin Thorpe, under the title of "History of England under the Normans," with additions and comments by the translator (London, 1845-'57). He made valuable contributions to the *Monumenta* of Pertz, and to the *Encyclopädie* of Ersch and Gruber, and published editions of several old authors.

**LAPPS.** See LAPLAND.

**LAPRAIRIE**, a S. W. county of Quebec, Canada, bounded N. by the St. Lawrence river, opposite the island of Montreal; area, 173 sq. m.; pop. in 1871, 11,861, of whom 10,154 were of French origin or descent, and 1,351 Indians. It is traversed by the Champlain and Province Line divisions of the Grand Trunk railway. Capital, Laprairie.

**LAPWING**, a plover of the genus *vanellus* (Linn.). The bill is shorter than the head,

slender, and straight, vaulted and curved at the end of both mandibles; wings very long and pointed, with the second and third quills equal and longest; tail moderate, broad, and even; tarsi longer than the middle toe, rather slender; anterior toes united at the base, hind toe not reaching the ground; claws short and slightly curved. About half a dozen species are described in Europe, South America, and northern Africa. They live in pairs in marshy moors and in dry or open districts, collecting in winter into flocks on the downs and seashore; their flight is rapid, and accompanied by a fanning noise, which has given them their name, and is performed with numerous singular evolutions and often repeated notes; they run with great speed on the ground. The food consists of worms, slugs, and insects; the nest is made of dried grass, and is placed in a slight hollow in the ground, generally containing four eggs; they adopt various stratagems to divert

Lapwing (*Vanellus cristatus*).

attention from the nest and young. The European lapwing (*V. cristatus*, Meyer) is a very handsome bird, of about the size of a pigeon; the upper parts are deep glossy green; the top of the head, crest, fore part of the neck, and breast black; sides of the neck, abdomen, and base of the tail white; a long delicate crest falls gracefully over the back; the tail feathers, except the outer, terminate in a large black space. The females and young have less metallic lustre, and their tints are less black. It is rather shy, but the males are very pugnacious in the love season; the eggs are greenish, spotted with black; incubation lasts 24 days. The flesh, though generally lean and dry, is esteemed as food, and the eggs are said to be delicious. It is widely distributed throughout Europe, northern Asia, and northern Africa. Some of the foreign species, as the *V. Cayanaensis* (Gmel.), have a spur at the fold of the wing, but in other respects resemble the European lapwing; they are very noisy, like

most of the plovers. Other lapwings of allied genera have fleshy appendages and caruncles at the base of the bill, as well as spurs on the wings, and defend themselves bravely against birds of prey.—For characters of the family, see PLOVER.

**LAR**, a town of Persia, capital of the province of Laristan, 175 m. S. S. E. of Shiraz, on the road to Beloochistan; pop. about 12,000. It contains good houses and one of the finest bazaars in Persia. The palace of the governor has strong walls and towers, and on an adjoining hill are the ruins of a castle. Cotton goods, firearms, and powder are manufactured to a limited extent.

**LARAMIE**, an E. county of Wyoming territory, bounded N. by Montana, E. by Dakota and Nebraska, and S. by Colorado; area, about 14,000 sq. m.; pop. in 1870, 2,957. It is intersected by the North Platte, and watered in the south by the South Platte and in the north by the Big Cheyenne, a branch of the Missouri. The N. E. part is occupied by a portion of the Black Hills. The Union Pacific and Denver Pacific railroads traverse the S. part. In 1870 there were 2 manufactories of tin, copper, and sheet-iron ware, 1 of boots and shoes, 1 of jewelry, and 2 railroad repair shops. Capital, Cheyenne, which is also the capital of the territory.

**LARAMIE**, a city and the county seat of Albany co., Wyoming territory, on the Union Pacific railroad, 7,122 ft. above the level of the sea, 57 m. by rail and 40 m. in a direct line W. N. W. of Cheyenne; pop. in 1870, 828; in 1874, about 2,500. It is regularly laid out at right angles with the railroad. A stream of clear cold water, fed by a spring at the foot of the Black Hills a few miles E., runs through the principal streets. The railroad company has erected extensive machine shops, a depot, and a large hotel; and there are also a court house and jail, a national bank with a capital of \$50,000, two schools, five churches, and two daily newspapers. It was laid out in April, 1868, when the railroad reached this point.

**LARASHI**, or **Larache**. See EL-ARAISH.

**LARCENY** (Fr. *larcin*, Lat. *latrocinium*, theft), the taking and removing, by trespass, of personal property, which the trespasser knows to belong either generally or specially to another, with the intent of depriving him of his general or special ownership therein. To this definition some authorities, but not all, add the further element that the act must be done for the sake of some advantage to the wrong doer. It cannot indeed be doubted that the crime of theft may be fully committed although the act be done without any thought of one's own advantage, and exclusively for the benefit of another; as if he should steal bread or clothing for a hungry or a naked man. Circumstances like these might affect the moral character of the action, and might mitigate the punishment inflicted by the court; but they could not change the legal character of the

case. At common law personal property alone could be the subject of this offence; of lands there can plainly be no larceny; and as the law conceives that everything attached to the land or realty partakes of its character, it would not be larceny, independently of statutes, to sever and carry away with felonious intent standing grain, or growing grass, or fruits from trees; or lead or copper fixtures from a building. But if these things were severed at one time and carried away at another after an interval of time sufficient to render the two transactions distinctly separate, a larceny would be committed; for the property would become by the severance the personal property of the owner of the realty, and rest as such in his possession before the asportation. The too narrow and technical construction of the common law in this respect has been remedied by legislative enactments. It is also essential to the offence that the thing stolen be of some value, though the smallest value, less even than that of the smallest coin, is sufficient. The common law recognizes no value in choses in action, so called, that is, in notes and other personal securities. It esteems them mere evidences of valuable rights; and on the principle that their merely material worth is merged in their representative value, there can be no larceny of such instruments, nor could a suit be maintained even for the value of the paper upon which they were written, unless they had been, by payment or otherwise, rendered void. This defect of the common law has also been remedied, and, by statutes, bank notes, books of account, notes and other valuable securities, are rendered subjects of larceny. The principle of value is also applied in the case of animals known to the law as *feræ naturæ*. It is the rule of the law that animals wild by nature are not subjects of larceny until they are reclaimed, and then only when they are fit for food. By the common law therefore there can be no larceny of dogs and cats and many other animals, however the civil jurisprudence may recognize a right of property in them.—A taking and a carrying away are also essential to constitute larceny, and an indictment for this crime must charge both these acts. If the party accused have for only an instant of time perfect control over the property, any, even the slightest, removal of the whole of it is sufficient. Thus one was held guilty of larceny who had snatched a watch, the guard of which, though for an instant free from the person of the owner, was while being withdrawn by the thief caught and arrested by a button. But where a purse became entangled by its strings with keys in the owner's pocket, though it had been raised from its place and out of the pocket, yet there was not a perfect control of the purse, and consequently no such carrying away as is essential to complete the offence. The required ownership may be either general or special. Stolen goods restolen from a thief

may be alleged in an indictment to be either his property or that of the true owner. And it is said that one may commit larceny of his own property, if he take it from the possession of his bailee, with the intent to charge him for its loss.—It is further requisite to the constitution of the crime of larceny that there be a coincidence in point of time of two distinct intents, viz., an intent to trespass on another's personal property, and an intent to deprive him of his ownership therein. Therefore, if one too drunken to conceive an intent to steal take property, but surrender it before any such intent is entertained, there can be no conviction for larceny. Nor was this crime held to have been committed in a case where, though there was a trespass, the property was taken with the intention of converting only its use to the service of the trespasser. The rule is that the trespass must concur in time with the intent to steal. This rule may seem to be and perhaps is rather technical than reasonable; but it is firmly fixed in criminal jurisprudence, and a clear apprehension of it is necessary to the right conception of the crime of larceny.—Trespass is a wrongful act of force done to the possession of another. Therefore, in respect to larceny, there can be no trespass against an owner who has not the possession of the property taken. On this principle rests the familiar rule of law, that common carriers and other bailees cannot commit larceny of the goods intrusted to them, so long as this relation exists; for under their contract of bailment they, and not the owners, have the legal possession of the property, and the essential trespass is therefore impossible. For example, the master of a ship, who steals one of several packages delivered to him to carry, does not commit larceny; but if he first break the package and then steal part of its contents, the offence of larceny is complete. The distinction between the two cases is clear. It is evident that the bailee must be first divested of his legal possession before the trespass is possible. In the former of the cases proposed, although by stealing the package without breaking its bulk he destroys the privity of contract between himself and his bailor, still the act is committed in respect of goods which at the time are in his legal possession; the termination of the contract and the act of conversion are simultaneous. But where the package is first broken, the act of breaking determines the contract of bailment and the right of the bailee to hold the property, for that is on the instant revested in the owner. Any act of conversion of the goods to the bailee's own use, after a trespass upon the owner's legal right has destroyed the trespasser's right of possession, completes the offence of larceny. A distinction is to be observed between this legal possession and a mere custody. Thus servants who have a thing in their custody to keep, or clean, or carry, have no right of possession; their possession is their master's possession, and he may at his own

pleasure take the thing from their hands; therefore they may commit larceny of any goods in their custody which came to them by delivery from the master, or were otherwise in his legal possession.—In all cases in which the legal possession is rightfully acquired, it is plain that trespass and therefore larceny cannot be possible. This principle may be practically illustrated by the example of lost goods. The finder may lawfully take such goods into his possession. He acquires a special property in them, defeasible only by the owner, and in virtue of this has the legal possession, so that, though he afterward ascertain who the owner is, and with felonious intent convert the goods to his own use, he is not guilty of larceny. To constitute the crime in such cases, the finder must at the time of the finding either know the owner, or have means of knowing him, or have reason to believe that he may be found, and must at that time have the felonious intent of appropriating the goods to his own use. The essential element and criterion of a trespass is the wrongful force. This force need not be exerted physically. It may consist in the unjust use of legal process. So it is a sufficient trespass to entice away an animal by the voice, or by offering food. A thief commits a trespass when he has gotten the control of an article by inspiring fear in the owner. In these cases the law refers the surrender of the ownership to the thief's act of force. Not so, however, when one is induced by a fraud to part with his property. Whatever remedy the defrauded owner may have in such a case in civil jurisprudence, in the criminal law there is no larceny; and though the intent of the taker were ever so felonious, yet the owner's consent precludes the act of trespass without which, as we have seen, the offence is not complete. So, if one obtains goods by falsely personating the party who had ordered them, he is not guilty of larceny, whatever be his intent, for the owner means to pass the property in the goods by the delivery. But, on the other hand, if he gets the loan of an article, his concurrent intent being to steal it, the owner's consent avails him nothing, and he commits the crime. The same principle applies to those cases in which an owner delivers goods with the understanding that the property in them is to pass when the price is paid, but the taker's object is to get possession of them without any intention of performing this condition.—The second intent essential to constitute the crime is the intent to deprive the owner of his ownership, or of his whole right of property, in distinction from any mere particular interest in it. So that he is no thief who takes a horse, however wrongfully, with the intention of using and then returning him.—The common law distinction between grand and petit larceny, which was determined by the value of the thing stolen, is in the United States very generally abolished. Compound larceny is larceny aggravated by taking the thing stolen

from the house or person of the party against whom the theft is committed.

**LARCH** (*larix*, the ancient name), a genus of deciduous coniferous trees, of the pine subfamily. They have at times been classed with the pines and the firs, from both of which they differ, principally in their deciduous clustered leaves and simple pollen grains. There are but few species, natives of mountainous countries in the northern parts of both hemispheres. The American larch (*L. Americana*) extends from the mountains of Virginia northward to Hudson bay; in New England and Canada it is known as hackmatack, and in the southern and western states it is called tamarack. In the forests it reaches the height of 70 ft., but is usually much smaller; in its more northern localities it is found on uplands,

American Larch (*Larix Americana*).

but as it advances south it more frequently grows in moist soil; in cultivation it succeeds on almost any soil, but makes the most rapid growth in a deep and moist one. It is a slender, erect tree, with horizontal branches; the primary leaves are scattered; the secondary ones are many in a fascicle, developed early in the spring from lateral, scaly, and globular buds; they are linear, about an inch long, of a very soft texture, of a light bluish green, which becomes in autumn a soft yellow color. The sterile catkins are borne near the ends of the branches, erect, round, and about a quarter of an inch long; the fertile ones, placed near the middle of the branches, are erect, half an inch long, of few scales, which at flowering time are of a crimson color; the ripe cone is about three fourths of an inch long. Some make a distinction between the black and the red larch,

but the only differences are those which may be produced by locality. The wood is very close-grained, compact, and remarkable for strength and durability; it is very heavy, and almost incombustible except when splintered; on account of these qualities it is valued in ship building. As an ornamental tree it is inferior to the European larch (*L. Europæa*), which differs mainly in its more pendulous branches and the shape and color of its cones, which are about one half larger. This species is found throughout central Europe, especially in the Alps, and is largely cultivated both as an ornamental and a timber tree. It is of remarkably rapid growth, and large plantations of it soon yield profitable returns. The plantations of the dukes of Athol in Scotland have become historical as illustrations of extensive and

European Larch (*Larix Europæa*).

profitable arboriculture; previous to 1826 the duke and his predecessors had planted more than 14,000,000 larches, occupying over 10,000 acres. Some plantations of moderate size have been set in our western states with prospects of success. A number of named varieties, in which there is a departure from the typical form, are offered in European nurseries. A very full account of the species, and of its cultivation and uses, is given in Loudon's "Arboretum et Fruticetum," vol. iv. The western larch (*L. occidentalis*) was first discovered by Nuttall in the northwest; it is found along the Columbia and other rivers of these regions, where it grows to the height of 150 ft. A few other species are enumerated, but little is known of them.—The FALSE LARCH is *pseudolarix Kämpferi* from China, where it is a favorite tree. It has an aspect between that of a

cedar and a larch. Its much longer leaves and larger and differently shaped cones distinguish it from the larch. The few specimens that are in cultivation in this country give promise of its success. It is also called the golden pine, a translation of its Chinese name.

**LARCHER, Pierre Henri**, a French scholar and author, born in Dijon, Oct. 12, 1726, died in Paris, Dec. 22, 1812. He early distinguished himself by his proficiency in Greek and English literature. In 1767 he wrote an able reply to Voltaire's *Philosophie de l'histoire*. In 1778 he was admitted a member of the academy of belles-lettres, and on the establishment of the imperial university he was appointed professor of Greek in that institution; but he was then over 80 years old, and had to discharge his duties by deputy. He died from a fall. His reputation chiefly rests on the translation of Herodotus (Paris, 1786), which is valuable for its geographical and chronological notes.

**LARD**, the oily portion of hogs' fat, separated from the animal tissues by the process called rendering, which is melting it out at the temperature of boiling water, and commonly with the mixture of a small quantity of water. The best and firmest lard is obtained exclusively from the fat which surrounds the kidneys; but the common qualities of commerce are derived from the entire fat of the animal. To render this harder various adulterating substances are added, as mutton suet, starch, potato flour, and even caustic lime. Alum also is often added with the view of increasing its whiteness; and in England common salt and the carbonates of soda and potash have been detected in samples of it. The presence of water and its quantity may be determined by submitting a weighed portion to moderate heat; it escapes in bubbles, and when these cease to appear the loss of weight indicates the proportion. If starch is present, it will cause a solution of iodine with which a particle of the lard is mixed to turn blue or even black. The proportion of the adulterating ingredients sometimes amounts to more than 25 per cent., of which the chief article is some farinaceous substance. Water has been found to the extent of 12 per cent.; alum of 2 to 3 per cent.; and quicklime of 1 per cent. Lard as prepared is run into kegs, but the best qualities are collected in England in bladders, and are distinguished by the name of bladder lard. When pure, the article should be firm and white, and entirely free from taste or smell; it should melt at 212° F. without bubbling, and without depositing any sediment; the melted fluid should be nearly as clear and transparent as water. Its melting point varies from 78.5° to 87.5° F. Its composition in 100 parts, as given by Braconnet, is: stearine and margarine 38, oleine 62.—Lard is extensively used in culinary operations as an article of food; it enters into the composition of pastry, and is the material in which fish and other articles are commonly fried. In this operation the

presence of flour is sometimes indicated by the substances fried adhering to the pan. In pharmacy lard is the material which forms the bulk of most of the ointments and cerates, and may be used alone as an ointment. A good article for this use, that contains no noxious ingredients, and is not liable to melt in warm climates, is difficult to be procured. The tendency to rancidity may be partly counteracted by adding to the melted lard a tincture of benzoin, of guaiacum, or of poplar buds. The oil of pimento and balsam of Peru are said to have the same preservative influence. The substance is also employed for lubricating machinery, for which use it is particularly important that it should be free from glutinous adulterants.—By the separation of the stearine and margarine from lard the oily product called lard oil is obtained. The manufacture of this is carried on to an immense extent in Cincinnati and Chicago. Of the stearine are made candles, and other portions of lard enter into the production of soap. A large portion of this oil is sent to France, where by the skill of the chemist it is incorporated with olive oil to the amount of 60 or 70 per cent., the mixture then coming back to be sold as pure olive oil. Some interesting properties of lard when combined with rosin, in the proportion of 3 parts by weight of lard to 1 of rosin, were communicated by Prof. Olmsted to the American association at their meeting in New Haven in 1850. When melted together, the mixture is semi-fluid in cold weather. When applied to leather, it renders it very soft and impermeable to air and moisture, and it is particularly well adapted for lubricating the pistons of air pumps, as it is found to protect the brass from corrosion, which the ordinary lubricants induce. The rosin appears to prevent the formation of an acid in the lard, and thus the compound is well adapted to protect the surface of any metal from rust. When used for iron, a little powdered graphite may be added. When the mixture is used instead of other oily substances for making soap, the tendency of this to become rancid when wet and remaining damp is checked. Other uses readily suggest themselves. As an illuminating agent in solar lamps, Prof. Olmsted found lard oil combined with rosin superior for a time to lard oil alone, but the wick after a time became clogged, lessening the brilliancy of the light.—In the year 1873-4, 191,139,000 lbs. of lard were produced in the United States, chiefly in Illinois and Ohio; the product in the preceding year was 218,655,238 lbs. The chief centres of this industry are Chicago and Cincinnati. In 1873, 230,534,207 lbs. of lard, valued at \$21,245,815, were exported from the United States, chiefly to Germany, England, and Belgium. The amount of lard oil exported was 388,836 gallons, valued at \$298,731. According to the census of 1870, the total value of the lard oil produced in the United States in that year was \$2,552,510.

**LARDNER, Dionysius**, a British writer on physical science, born in Dublin, April 3, 1793, died in Paris, April 29, 1859. After four years' experience in the office of his father, a solicitor, he entered Trinity college, Dublin, in 1812, and graduated in 1817. He continued a resident member of the university till 1827. During his college career he evinced an extraordinary aptitude for mathematical studies, and gained between 15 and 20 prizes in metaphysics, pure mathematics, natural philosophy, astronomy, and moral philosophy. He took orders, and was for some time chaplain at his college; but he subsequently desisted from all clerical functions. During his residence at the university he published various mathematical works, including an edition of the first six books of Euclid, with a commentary, and contributed a number of articles on mathematical subjects to the "Edinburgh Encyclopædia" and the "Encyclopædia Metropolitana," and a series on the various branches of natural philosophy to the "Library of Useful Knowledge." In 1828 appeared his "Popular Lectures on the Steam Engine," for which he received a gold medal from the royal Dublin society. Upon the establishment of the London university he accepted the professorship of natural philosophy and astronomy; and fixing his residence in London in 1828, he published in the same year a "Discourse on the Advantages of Natural Philosophy," and an "Analytical Treatise on Plane and Spherical Trigonometry." This was followed by his "Cabinet Cyclopædia," commenced in 1830 and continued till 1844, embracing 132 vols. 12mo. In this work he secured the coöperation of the most eminent authors of the day. His own contributions comprised treatises on arithmetic, geometry, heat, hydrostatics and pneumatics, and mechanics. While engaged on this work he wrote occasional articles on physical science and its application to the useful arts for the periodicals, and was frequently before parliamentary committees as a witness in behalf of railway companies. In 1840 he eloped with the wife of Captain Heavyside, and came to the United States. He was sued for damages, and a verdict for £8,000 was entered against him. He married this lady after her husband's death. During five years' residence in America he delivered in the chief cities a series of lectures, which were published and have passed through many editions. On his return to Europe in 1845 he settled in Paris, where he resided until his death. Dr. Lardner's remaining works are: "Railway Economy" (1850); "Handbook of Natural Philosophy and Astronomy" (2 vols., 1851-2); "The Great Exhibition Reviewed" (1852); "The Museum of Science and Art," a series of popular treatises on the physical sciences and their application to the industrial arts, commenced in 1854, and completed in 12 vols. 12mo; and handbooks of "Natural Philosophy and Hydrostatics," of "Pneumatics and Heat," of "Natural Philosophy and Me-

chanics," of "Natural Philosophy, Electricity, Magnetism, and Acoustics," and of "Natural Philosophy and Optics" (1854-'6).

**LARDNER, Nathaniel**, an English divine, born at Hawkshurst, Kent, in 1684, died there, July 24, 1768. He belonged to the Presbyterian denomination, but entertained Unitarian opinions. He was educated at London, Utrecht, and Leyden, and was the author of many valuable theological works. That on which his fame chiefly rests is his "Credibility of the Gospel History" (5 vols. 8vo, 1727-'57), which is regarded as one of the ablest works upon that subject. There are two complete editions of Dr. Lardner's works, the last in 10 vols. 8vo (London, 1828), and the other in 5 vols. 4to (London, 1815).

**LARES**, a class of inferior divinities or protecting spirits in ancient Rome, domestic and public. Their worship was closely connected with that of the manes, but only the spirits of the good were honored as lares. The household lares were headed by the *lar familiaris*, who was revered as the founder of the family. When the latter changed abode, he followed them. The worship of the public lares is said to have been introduced by Servius Tullius; it was renewed by Augustus. They were considered as the protecting spirits of the city, and had a temple in the Via Sacra. There were others who were regarded as presiding over the several divisions of the city, over the rural districts, high roads, &c. In great houses the images of the household lares had their separate apartment, called *edicula* or *lararium*. Their worship was simple; they received offerings in *patella*, especially on the calends, nones, and ides of every month. On joyful occasions they were adorned with wreaths. (See PENATES.)

**LARIMER**, a N. county of Colorado, bordering on Wyoming territory, bounded W. by the Medicine Bow mountains, and intersected by the South Platte river; area, about 1,200 sq. m.; pop. in 1870, 838. The mountainous region in the west abounds in pine timber, and numerous streams, among which is the Cache à la Poudre, furnish water power. The E. part is undulating and adapted to agriculture. The chief productions in 1870 were 12,923 bushels of wheat, 9,354 of Indian corn, 40,213 of oats, 26,075 of potatoes, 34,190 lbs. of butter, and 3,174 tons of hay. There were 801 horses, 1,301 milch cows, 3,292 other cattle, 611 sheep, and 113 swine; 1 flour mill, and 3 saw mills. Capital, Laporte.

**LARISSA** (Turk. *Yenishehr*, new town), a town of European Turkey, in the vilayet and 75 m. S. S. W. of the city of Salonica; pop. about 20,000, more than half Turks, and the rest Greeks, Jews, &c. It is situated on a gently rising ground on the river Selembria (anc. *Peneus*), crossed here by a bridge of ten arches. It is the seat of a Greek archbishop and of a Turkish pasha, possesses some manufacturing establishments, and trades in the products of the country.—Larissa was an im-

portant town in the ancient Grecian province of Thessaly, and celebrated for its bull fights. It is said to have been founded by Acrisius, king of Argos. In process of time its inhabitants attained considerable power, and became lords of the surrounding plain, and the town the capital of Pelasgiotis. In the Peloponnesian war they supported Athens against Sparta. They were afterward reduced to subjection, in common with the other Thessalians, successively by the Macedonians, the Romans, and the Turks.

**LARISTAN**, a S. province of Persia, bordering on the Persian gulf, and bounded landward by Kerman and Fars; area, about 23,000 sq. m. In antiquity it formed a part of Carmania. It is one of the poorest divisions of the empire, consisting mainly of an arid sandy waste, with salt steppes and several mountainous elevations, the highest of which are Mounts Tcharek, Kor, Khalatu, and Nabend. There is a scarcity of water, the principal river being the Div-rud, and there is little or no agriculture beyond the raising of small quantities of wheat, barley, and dates. The coast is occupied by Arabs, who live under their own sheik, and pay an insignificant sum for tribute. Capital, Lar.

**LA RIVE. I. Charles Gaspard de**, a Swiss chemist, born in Geneva, March 14, 1770, died there, March 18, 1834. In 1794 he left Switzerland on account of the political disturbances, and went to Edinburgh, where he studied medicine and chemistry and became president of the royal medical society. He returned to Geneva in 1799, took charge of an insane asylum, and in 1802 was made honorary professor of pharmaceutical chemistry. He also became prominent in politics, and was a member of the representative council. He founded the museum of natural history, a botanic garden, and courses of public lectures. He was the first on the continent to make known the discoveries of Davy and other English physicists, and to construct a large galvanic battery. Many of his writings were published in the *Bibliothèque Britannique* and the *Bibliothèque universelle* of Geneva. **II. Auguste de**, son of the preceding, born in Geneva, Oct. 9, 1801, died in Marseilles, Nov. 27, 1873. He studied under his father, and became professor in the academy of Geneva, a correspondent of the French institute, a member of the London royal society, and editor of the *Bibliothèque universelle*. He vindicated by his experiments the electrochemical theory in respect to galvanic batteries. In 1842 he received the Montyon prize of 3,000 francs from the French academy of sciences for his inventions relating to galvanoplasty. In 1864 he was made one of the eight foreign associates of the French academy. His principal work is *Traité d'électricité théorique appliquée* (3 vols., Paris, 1854-'8).

**LARK**, a conirostral bird of the family *alaudidæ*, coming in many respects near the finches. The family characters are: a short and conical bill with the frontal feathers extending along

the sides; the first primary very short or wanting; the tarsi scutellate before and behind; the hind claw very long and nearly straight; the tertials greatly elongated beyond the secondaries and nearly as long as the primaries. The genus *Alauda* (Linn.) belongs to the old world,

Sky Lark (*Alauda arvensis*).

and is found on plains and cultivated lands, migrating to the south in winter; many species sing while rising into the air in large circles or in a perpendicularly spiral manner to a very great height; the flight is undulating; they walk and run with ease. The food consists of grains, small seeds, grasshoppers, gnats, and small worms; the nest is usually placed in the grass on the ground. The sky lark or field lark (*A. arvensis*, Linn.), so celebrated in poetry for its song, is very generally distributed over Europe, Asia, and northern Africa. It is about  $7\frac{1}{2}$  in. long and 15 in extent of wings; the general color of the upper parts in both sexes is light reddish brown with darker streaks, the fore neck the same with brownish black spots, the sides streaked with dusky, the lower parts dull white, an obscure brownish white band over the eye, the quills and the outer tail feathers edged with white, and the iris hazel. Though the plumage is dull, the form is elegant; its song is not finely modulated nor mellow, but it is exceedingly cheerful and prolonged, and in early morning sounding from on high when the bird is entirely out of sight; this, combined with its extraordinary power of flight, has associated the lark with the most delightful recollections of rural life. It would be very difficult to imitate its song musically; it is occasionally uttered when the bird is on the ground, but usually as it commences its flight; the character of its different strains is such that it is said that one accustomed to the song can tell whether the bird be ascending, stationary, or descending. When on the ground larks are in the habit of crouching, so as to be perceived with difficulty; they rarely if ever alight on trees. They begin to pair in early spring, at which time their song begins,

continuing until the middle of autumn; the four or five eggs are greenish gray, irregularly freckled with darker. The lark rests on the ground at night; its principal enemies are weasels and the smaller hawks. Its flesh is eaten, though inferior to that of the thrushes. It is often kept as a cage bird, even in America, as it sings nearly as well in confinement as when at liberty; to prevent injury from its soaring propensities, it is usual to pad the top of the cage.—The wood lark (*A. arborea*, Linn.) resembles the preceding in plumage, but is a smaller bird, being  $6\frac{1}{2}$  in. long, with an extent of wings of 12 in.; the habits are like those of the sky lark, except that it inhabits woody places and frequently perches on trees; the song, though less diversified, is more melodious, and has been considered inferior only to that of the nightingale; the eggs are pale yellowish brown, with darker lines and freckles.—The only genus of the family found in North America is *eremophila* (Boie), having no spurious first primary; it has a pectoral crescent and cheek patches of black. The American sky lark or shore lark (*E. alpestris*, Boie; genus *otocoris*, Bonap.) is about  $7\frac{1}{2}$  in. long, with an extent of wings of 14 in.; the color above is pinkish brown, streaked with dusky on the back; a broad band across the crown, patch from bill below the eye, crescent on throat, and tail feathers black; frontal band over eye, under parts, outer edge of wings, and tail white, and chin and throat yellow; the colors are lighter in some specimens than in others, especially in winter. The principal peculiarity in the plumage consists in two erectile pointed tufts of feathers on the sides of the head, somewhat resembling the ears of the owls. It is distributed from Labrador over the prairies and desert plains of North America, visiting the Atlantic states especially in winter, when

American Sky Lark (*Eremophila alpestris*).

it is very fat and much esteemed as food. Audubon found this lark breeding on the desolate shores of Labrador, making its nest in the mosses and lichens in the beginning of July; the eggs, four or five, are grayish, with numerous pale blue and brown spots; it returns

to the south in the early part of September. The song of the males on the wing is very sweet, though comparatively short. The food consists of seeds, insects, and larvæ, and minute crustaceans on the seashore.—Birds of the family *syvicolidæ*, of the genus *anthus* (Licht.), generally called larks, will be described under **TITLARK**; the red-breasted and meadow larks are starlings, of the family *icteridæ*, and will be noticed under **STARLING** and **MEADOW LARK**.

**LARKSPUR.** See **DELPHINIUM**.

**LARNAKA**, or *Larnica* (anc. *Citium*), the principal seaport town of the island of Cyprus, 23 m. S. E. of Nicosia; pop. about 10,000. In the lower town are the bazaars and the houses of the commercial classes, and in the upper town are a cathedral and a convent. Between these two parts are gardens and some relics of antiquity. Larnaka is filthy, like most Levantine towns, and the climate is unhealthy. The exports in 1872 were valued at £26,189, about one half madder, and the rest rags, cotton, sheep and goat skins, barley, and sumach.

**LARNED**, Sylvester, an American clergyman, born in Pittsfield, Mass., Aug. 31, 1796, died in New Orleans, Aug. 31, 1820. He received his collegiate education at Middlebury, Vt., studied theology at Princeton, N. J., and was ordained in July, 1817. His earliest efforts showed rare gifts of eloquence. In the autumn and winter following his ordination he proceeded to New Orleans by the way of Detroit, Louisville, and the Mississippi river, preaching whenever opportunity offered during the three months occupied in the journey. At New Orleans his eloquence made a profound impression. A church was soon organized, and a congregation collected, over which he was settled as pastor, and a large church edifice erected. In the summer of 1820 the yellow fever broke out with unusual violence, and he was urgently entreated to seek safety in flight; but he refused to desert the post of duty, and fell a sacrifice to his fidelity. A memoir of his life, with a collection of his sermons, was published in 1844 by the Rev. R. R. Gurley.

**LA ROCHEFOUCAULD**, François, duke de, prince of Marsillac, a French author, born in Paris, Dec. 15, 1613, died March 17, 1680. He was in boyhood withdrawn from school to enter the military service, and at the age of 16 was engaged as an officer at the siege of Casale. Of a naturally timid, irresolute, and melancholy character, as he himself has recorded, and unfitted to be a political partisan, he was immediately involved in the intrigues which distracted the court. His father was banished to Blois in 1632 for some connection with the revolt of Gaston of Orleans, and he himself shared his exile, being suspected of hostility to Cardinal Richelieu on account of his intimacy with the friends of Queen Anne of Austria. At Tours he met in 1637 the duchess de Chevreuse, then in correspondence with the queen and the Spanish court. He entered with zeal into the intrigues against the cardinal; obtained per-

mission to return to Paris at the moment when the queen, accused of communications with Spain, was subjected to a sort of judicial examination; and, in his devotion to her, accepted her proposal to guide her and Mlle. d'Hautefort in flight to Brussels. He had made preparations for this purpose, when he was discovered to have favored the flight of the duchess de Chevreuse into Spain, and was thrown into the Bastille. Released after eight days, he went into retirement at Verteuil, where he lived as a country gentleman, at the same time corresponding with the enemies of Richelieu and participating in the projects of Cinq-Mars and De Thou. He returned to the court after the death of the cardinal (1642), and was received with kindness, but, being unrewarded by the queen and Mazarin, showed his resentment by attaching himself to the duke d'Enghien and forming a *liaison* with his sister, the duchess de Longueville, his devotion to whom for several years was merely a matter of interest and calculation. In the wars and intrigues of the Fronde he served the party of the parliament, in the defence of Bordeaux (1650), and in the faubourg St. Antoine of Paris, and on the conclusion of peace abandoned the pursuits of ambition for a life of repose and reflection. He described his occupations thus far as a "business for fools and wretches, with which honorable and well-to-do persons should not mingle." To his relations with Mme. de Longueville succeeded the friendship of Mme. de Sablé, Mme. de Sévigné, and Mme. de Lafayette; and his house became a resort of those most distinguished for wit and culture, including Boileau, Racine, and Molière. The first fruit of his leisure was his *Mémoires* (Cologne, 1662; 3d ed., 1664), which are among the most interesting records of the intrigues against Richelieu and of the period of the Fronde. Three years later he published his *Réflexions, ou Sentences et maximes morales*, a volume of 150 pages containing 360 detached thoughts; the first book, according to Voltaire, written in Europe after the revival of letters in a lively, precise, and delicate style, and which contributed more than any other to form the taste of the French nation. The fundamental and pervading thought, that self-love is the motive of all human actions, is presented under such various aspects and with so much acuteness of observation, that every maxim is piquant and suggestive, though few of them may be true. Though his philosophy is not metaphysical, but founded on the ways of the world, and though his statements are rarely absolute, but applied only to the usual conduct of the greater number of persons, yet his persistent reduction of virtues into disguised vices justifies Rousseau in pronouncing it a "sad book." The only thing, La Rochefoucauld says, that is really injurious and justly condemned by men, is not vice, but crime. The *Maximes* passed through five editions in the lifetime of the author, and have been frequently republished. An excellent

edition, prepared by Gratel-Duplessis, and edited by Sainte-Beuve, appeared in Paris in 1853.

**LA ROCHEFOUGAULD-LIANCOURT, François Alexandre Frédéric**, duke de, a French statesman and philanthropist, born Jan. 11, 1747, died in Paris, March 27, 1827. Having fallen under the displeasure of Mme. du Barry, he found little inducement to attend the court of Louis XV., but passed his time chiefly on his estate of Liancourt, where, under the influence of a visit to England in 1769, he established a model farm. He also established there a school of arts and trades, which became the parent of the institution bearing the same name at Châlons. After the destruction of the Bastille in July, 1789, he was appointed president of the national assembly. His efforts to befriend the king, after the life of the latter had been menaced, having brought him into danger, he took refuge in England, and subsequently travelled in the United States and Canada. He returned to France in 1799, and for some years lived in obscurity in Paris. Still busy with philanthropic plans, he aided in introducing vaccination into France, and inaugurated the system of dispensaries in Paris. Napoleon admitted him to the chamber of peers, under his hereditary title. After the restoration he became a member of the general council of hospitals, and president of the society of Christian morals, in which capacity he labored to abolish the slave trade, and to suppress lotteries and gaming houses. He was inspector general of the school of arts and trades at Châlons for 23 years, and a member of various public bodies of an industrial and philanthropic character, from most of which he was removed by the ministry in 1823 in consequence of his liberal political views. The academy of sciences testified their disapprobation of this persecution by admitting him a member, and the academy of medicine appointed him on the commission destined to replace the committee of vaccination, of which he had been president, and which had been suppressed by government. He subsequently inaugurated the system of schools for mutual instruction, and established the first savings bank in France. He was a voluminous writer, and among his publications are works on pauperism, on public instruction, on savings banks, on prison discipline, &c. Among the fruits of his visit to America were an account of the prisons of Philadelphia (Philadelphia and Paris, 1796), and *Voyage dans les États-Unis de l'Amérique* (8 vols., Paris, 1800).

**LA ROCHEJAQUELEIN. I. Henri du Verger**, count de, a French royalist, born in the château of La Durbelière, near Châtillon-sur-Sèvres, Poitou, in August, 1772, killed at Nouaillé, March 4, 1794. He was educated at the military school of Sorèze, and after the outbreak of the French revolution entered the constitutional guard of Louis XVI.; but after the massacre of the Swiss guards, Aug. 10, 1792, he retired to Poitou, and joined the marquis de Lescuré in the movement organized among the

people of La Vendée for the reestablishment of the monarchy. The peasantry having determined to select their leaders from the provincial nobility, the parishes around Châtillon chose La Rochejaquelein, who joined his followers at St. Aubin in March, 1793, and addressed them in a brief speech, ending with these words: "I am young and without experience; but I burn to show myself worthy to be your commander. Let us meet the enemy. If I advance, follow me; if I retreat, kill me; if I fall, avenge me!" The peasants, animated by his example, on the succeeding day attacked the republicans at Aubiers with irresistible force; and having effected a junction with the royalists of Anjou, they defeated the enemy in several encounters. At the attack upon Thouars, May 4, La Rochejaquelein, mounted upon the shoulders of Texier de Courlai, helped to detach with his own hands some of the stones from the wall, and was the first to mount it. At the battle of Fontenay, May 16, and the siege of Saumur in June, he showed equal intrepidity. In a short time the royalist troops had taken 80 pieces of cannon and 12,000 prisoners, with the loss of fewer than 500 killed and wounded. In the less fortunate engagements at Luçon and Cholet, at which the chief Vendean leaders were killed or disabled, La Rochejaquelein performed prodigies of valor; and upon the assembling of a new army at Varades, on the northern bank of the Loire, whither the Vendéans had fled after their defeat at Cholet, he was chosen generalissimo, as the only one capable of reviving the spirits of the troops. Accepting with reluctance this responsible trust, which seemed incompatible with his extreme youth, he marched toward the coast of Brittany in the expectation of meeting there promised succors from England. In October he occupied Laval, driving out a large body of national guards, and immediately after sustained an attack by the republicans under Lechelle, which resulted in one of the most glorious victories for the Vendéans during the war. The enemy were driven in scattered parties as far as Nantes and Rennes, losing 12,000 men and 19 pieces of cannon. Elated by their success, the royalists, 30,000 strong, attacked Granville, Nov. 14; but having no artillery with which to breach the ramparts, they received an unexpected check and were obliged to fall back with the loss of 1,800 men. This disaster disconcerted the plans of La Rochejaquelein, who was about to advance to Caen; and to add to his embarrassment a revolt broke out among his hastily assembled levies, whom it required all their commander's powers of persuasion to prevent from returning at once to their homes. As it was, a retrograde march toward the Loire had to be conceded to them. On their way they defeated a large body of republicans at Pontorson; but the latter, having rallied at Dol, Nov. 21, where they were largely reinforced, opposed the royalists with 35,900 men and a numerous park of artillery.

The first attack of La Rochejaquelein's troops was irresistible, and the republicans were driven several leagues beyond the town. But here the left wing of the royalists, disordered in pursuit, was assailed in turn by the republican right and driven back in confusion into the town. A panic seized the whole royalist army, and their leader, after vain endeavors to stay their flight, threw himself in despair in front of a hostile battery in the hope of finding an honorable death. But a Vendean priest holding a crucifix in his hand succeeded by an appeal to their religious enthusiasm in rallying 2,000 of the fugitives; the combat was renewed, and the republicans were routed in all quarters and fled toward Rennes, leaving 6,000 killed and wounded on the field. They, however, almost immediately concentrated at a strongly fortified position before Antrain, where another battle ensued, resulting in a complete victory for the Vendéans. On this occasion La Rochejaquelein interfered to prevent his troops from retaliating upon their prisoners the acts of cruelty perpetrated by the republicans. Again the Vendean leaders projected an advance toward the coast for the purpose of opening communications with the English, and again they were compelled by open mutiny among their followers to continue their march toward the Loire. Arriving at Angers Dec. 3, they made a desperate but unsuccessful attack upon the place; and, wearied, disheartened, and encumbered by an immense and fast increasing train of sick and wounded, they retreated toward La Flèche, which La Rochejaquelein entered by a *coup de main*, and thence proceeded to Le Mans. Here they were attacked, Dec. 12, by 40,000 republicans under Marceau, Westermann, and Kléber, and, although reduced to about 12,000 men fit for duty, they confronted their enemies with unflinching resolution. Owing to the skilful dispositions of La Rochejaquelein, the republicans were for a long time held in check outside the walls; but gradually they forced their way into the town, and for hours a terrible night conflict was maintained within the streets. Finally the royalists were overpowered and forced out of the town in a confused mass. Their leader, who had two horses killed under him and was wounded and overturned in the tumult, endeavored in vain to bring them to a final stand, and was borne off with his followers, who dispersed in various directions, leaving their baggage and almost all their artillery in the hands of the victors. La Rochejaquelein assembled the small remnant of his troops at Laval, Dec. 14, whence they moved to Ancenis to attempt the passage of the Loire. Here he embarked in a small boat with a few of his men for the purpose of seizing some large vessels on the opposite side of the river; but being attacked by a numerous party of republicans, his men were killed or dispersed, and he was obliged to gain refuge in a neighboring forest. Thenceforth he led the life of a parti-

san chief, gathering around him a band of followers, with whom he frequently sallied forth from his lurking places upon the republican posts. On one of these occasions, his men being about to fall upon two republican grenadiers, he ran forward exclaiming: "Surrender! I give you quarter," and was immediately shot dead by one of them. His comrades buried him upon the spot, but his body was afterward interred in the cemetery of St. Aubin. Although not 22 years of age at the time of his death, he was recognized as the main support of the royalist cause in western France. **II. Louis du Verger**, marquis de, commander of the last Vendean army, brother of the preceding, born Oct. 30, 1777, killed at Pont-des-Mathis, June 4, 1815. He emigrated with his father, the marquis de La Rochejaquelein, at the commencement of the revolution, and, after being employed in the military service of Austria and England, returned in 1801 to France and married the widow of the marquis de Lescuré, one of the bravest of the Vendean leaders. He aided in the restoration of the Bourbons in 1814, and after protecting the flight of Louis XVIII. to Ghent in March, 1815, landed at St. Gilles on the Vendean coast, and aroused the ancient enthusiasm of the inhabitants in behalf of the royal cause. With a few thousand men he encountered an imperial division under Gen. Travot near the village of Mathis, and was killed at the commencement of the action.—His son HENRI AUGUSTE GEORGES (1805-'67) was conspicuous during the reign of Louis Philippe and the second republic as leader of the democratic legitimists, but abandoned his party after the *coup d'état* of Dec. 2, 1851, and was made a senator by Napoleon III. **III. Marie Louise Victoire de Donnissan**, marchioness de, wife of the preceding, born in Versailles, Oct. 3, 1772, died in Orleans, Feb. 15, 1857. With her first husband, the marquis de Lescuré, she shared in the horrors attending the war in La Vendée, and, after the final rout of the royalists at Savenay, escaped almost by a miracle. After the death of the marquis de La Rochejaquelein she resided in Orleans. Her *Mémoires* (Bordeaux, 1815) present a vivid picture of the revolution in the west of France, derived from her personal experiences.

**LA ROCHELLE.** See ROCHELLE.

**LA ROMANA, Marquis.** See ROMANA.

**LAROMIGUIÈRE, Pierre**, a French philosopher, born at Livignac-le-Haut, Guienne, Nov. 3, 1756, died in Paris, Aug. 12, 1837. He was a member of the congregation of *doctrinaires*, and from 1774 to 1783 taught the classics and philosophy in various colleges in the south of France. He held the chair of philosophy in the college of Toulouse from 1784 till the suppression of the religious communities in 1790. Removing to Paris, he became associated with Sieyès and other leaders of the national assembly. In 1795 he was appointed professor of philosophy in the Prytaneum (lyceum of Louis XIV.), and in the following year was elected a

member of the academy of moral and political sciences. In 1811 he was called to the chair of philosophy in the faculty of letters at Paris. His professorship was filled by a deputy from 1813, but he continued to be librarian of the university. His philosophical system is a modification of that of Condillac. His principal work is the *Leçons de philosophie* (2 vols., 1815-'18), which embraces the lectures delivered by him in 1811 and 1812, and has been from its first appearance adopted for public instruction in France. In later editions other important writings have been included.

**LARREY. I. Dominique Jean**, baron, a French surgeon, born at Baudéan, near Bagnères-de-Bigorre, in July, 1766, died in Lyons, July 25, 1842. He studied medicine and surgery at Toulouse, and in 1787 went to Paris, where he was appointed surgeon to a frigate, in which he visited America. After returning to France he became an army surgeon (1792), and served during the wars of the revolution. It was at this time that he invented the *ambulances volantes*, for which he was rewarded with promotion to the rank of surgeon-in-chief. In 1798 he accompanied the French army to Egypt, where at Aboukir and Alexandria he displayed remarkable bravery. At Austerlitz he attended to the wounded under the heaviest fire; at Eylau he saved a great number of wounded by his daring; at Essling he killed his own horses to make soup for the wounded when other food was wanting; on the battle field of Wagram he received the title of baron; while in Spain and in Russia he extended the same care to the enemy's wounded as to those of the French. At the battle of Waterloo he was wounded, carried as a prisoner from post to post, and was about to be shot when he was recognized by a Prussian soldier and led to Blücher, the life of whose son he had formerly saved, and by whom he was sent under escort to Louvain. On the restoration he was summoned by the emperor Alexander to Paris. He was deprived of his pension, but was made surgeon-in-chief of the royal guard. His pension was restored to him in 1818 by special resolution of the chamber. Napoleon in his will left Larrey 100,000 francs. "If the army ever erect a monument of gratitude," said the emperor, "it should be to Larrey." Two statues were afterward raised to him, one in 1850 in the court of the Val-de-Grâce hospital, another in the hall of the academy of medicine. After the revolution of July he travelled in Belgium, southern France, and Italy, for the purpose of studying epidemics. In 1842 he was engaged in inspecting the hospitals in Algeria, where he was attacked by pneumonia; he hastened to return to Paris, but died on the road. His discoveries relative to gun-shot wounds; cholera, ophthalmia, tetanus, extraction of foreign bodies from the brain, and amputations, were all of the highest importance. There were few branches of surgery on which he did not advance new and valuable views. He was the

author of a great number of medical works and memoirs, many of which have been translated into foreign languages. **II. Félix Hippolyte**, baron, son of the preceding, born in Paris, Sept. 18, 1808. He served as a surgeon with the French army at the siege of Antwerp in 1830, became professor of pathology at the Val-de-Grâce in 1841, and was surgeon in ordinary to Napoleon III., and chief surgeon in the Italian campaign of 1859. In 1867 he was elected a member of the academy of sciences. His writings consist chiefly of reports and contributions to periodicals.

**LA RUE**, a central county of Kentucky, drained by Rolling fork of Salt river; area, 182 sq. m.; pop. in 1870, 8,235, of whom 965 were colored. It has a rolling surface and a good soil. The Louisville and Nashville railroad skirts the S. W. border, and the Knoxville branch passes through the county. The chief productions in 1870 were 61,537 bushels of wheat, 314,424 of Indian corn, 70,807 of oats, 368,100 lbs. of tobacco, and 110,964 of butter. There were 3,046 horses, 1,783 milch cows, 2,850 other cattle, 9,064 sheep, and 19,670 swine; 4 distilleries, 4 flour mills, and 3 saw mills. Capital, Hodgenville.

**LARVA**, the first and much the longest stage of the life of an insect, after emerging from the egg. The form is wingless, generally elongated and worm-like, known as the caterpillar, grub, or maggot, according to the order of the insect. In this stage most of the time is spent in eating, and the growth is very rapid, with frequent change of the skin. After a time this state passes into that of the pupa or chrysalis. (See CATERPILLAR.)

**LARYNX**. See LUNGS.

**LA SALLE. I. A S. W.** county of Texas, intersected by the Rio Frio and the Rio Nueces; area, 1,400 sq. m.; pop. in 1870, 69. Water is scarce, and the county is not adapted to agriculture, but grazing may be successfully pursued. Fort Ewell, a government post, is within its limits. In 1870 the county produced 26,000 lbs. of wool, and there were 140 horses, 5,000 sheep, and 11,100 cattle. **II. A N.** county of Illinois, traversed by the Illinois river and its affluents, the Fox and Vermilion; area, 1,050 sq. m.; pop. in 1870, 60,792. It has an undulating surface, occupied chiefly by prairies, but in some places well timbered, and abounds in coal mines. It is traversed by the Illinois Central and several other railroads. The chief productions in 1870 were 273,374 bushels of wheat, 48,308 of rye, 3,077,028 of Indian corn, 1,509,642 of oats, 86,635 of barley, 325,953 of potatoes, 66,803 lbs. of wool, 1,240,386 of butter, 151,055 of cheese, and 97,273 tons of hay. There were 24,673 horses, 17,605 milch cows, 29,338 other cattle, 17,200 sheep, and 36,717 swine; 8 manufactories of agricultural implements, 7 of brick, 27 of carriages, 1 of dressed flax, 1 of window glass, 5 of iron castings, 3 of machinery, 1 of organs, 1 of linseed oil, 14 of saddlery and harness, 4 of

sash, doors, and blinds, 1 of woollen goods, 12 flour mills, 1 tannery, 1 currying establishment, and 6 breweries. Capital, Ottawa.

**LA SALLE**, a city of La Salle co., Illinois, situated at the head of navigation on the Illinois river, at the terminus of the Illinois and Michigan canal, and at the intersection of the Illinois Central and the Chicago, Rock Island, and Pacific railroads, 80 m. W. S. W. of Chicago; pop. in 1860, 4,016; in 1870, 5,200. It is built on a bluff rising from the river, and enjoys a pleasant and healthful situation and great facilities for trade. The river, here 900 ft. wide, is crossed by a railroad bridge of 20 arches. The surrounding country is fertile, and abounds in bituminous coal, of which large quantities are shipped from this point. There are extensive zinc works, breweries, flouring mills, founderies and machine shops, glass works, &c. It has graded public schools, including two high schools, two weekly newspapers, and five churches.

**LA SALLE, Jean Baptiste**, founder of the "Brothers of the Christian Schools," born in Rheims, April 30, 1651, died in Rouen, April 7, 1719. He was appointed a canon of the cathedral of Rheims in 1669, and the next year went to St. Sulpice, Paris, to complete his course of theology. In 1671 he was ordained priest, and forthwith resolved to devote his whole life to the improvement of the working classes. He began by obtaining a royal charter for a sisterhood already established in Rheims, destined to teach exclusively the poor children of their sex. He then engaged in founding a brotherhood devoted to the instruction of poor boys, and with a few associates opened schools in two of the parishes of Rheims. The number of these schools increased rapidly, and he united the teachers in a common residence, giving them a distinctive dress of the coarsest material, and a few simple rules to be observed by all. In order to encourage his followers to practise religious poverty, he renounced his prebend in favor of a poor priest, distributed his patrimony in alms, and thenceforward taught daily in the schools. The new brotherhood spread rapidly throughout France. In Paris the secular teachers sued him before the courts, and compelled him to leave the city. At Rouen he purchased the establishment of St. Yon, which became the central house of the brotherhood. (See BROTHERS OF THE CHRISTIAN SCHOOLS.) The canonical process of his beatification is nearly completed at Rome. He left several works, among which two have been frequently reprinted: *Les règles de la bienséance et de la civilité chrétiennes*, and *Les douze vertus d'un bon maître*.

**LA SALLE, Robert Cavalier**, sieur de, a French explorer, born in Rouen in November, 1643, killed in Texas, March 19, 1687. He is said to have forfeited his patrimony by becoming a Jesuit; but he withdrew from the order, and went to Canada early in 1666. He settled at Montreal, and from the Sulpicians, seigneurs

of the island, to which body his brother Jean belonged, obtained a grant of land and founded La Chine. He soon disposed of this, and in 1669 started on an exploring expedition with the Sulpicians Dollier de Casson and Galinée; but after visiting the Seneca country he parted with them near the head of Lake Ontario, on the Canada side, on account of illness. He is then said to have returned to the Iroquois country, reached the Ohio, and descended it to the falls where Louisville now stands. An assertion made recently that about this time he descended the Illinois to the Mississippi rests on an anonymous statement of conversations, and is unsupported by his own petitions and documents as to his discoveries. After Frontenac established Fort Frontenac, on Quinté bay, La Salle went to France in the autumn of 1674, with strong commendatory letters from the governor general to Colbert. He was received with favor, ennobled, obtained a grant of the fort and adjacent lands, and was made governor of the fort and settlement, May 13, 1675. He replaced the palisade fort with one of cut stone, gathered French and Indian settlers around it, and soon had four decked vessels on the lake, making his post the centre of the fur trade, on which he now entered; and Canada became divided into two great antagonistic organizations, both grasping at a monopoly of the peltries. With a view of extending his operations to the west, and perhaps finding a way to the western ocean and China, he returned to France, and in May, 1678, obtained permission to carry on western explorations for five years, build and hold forts, and enjoy a monopoly of the trade in buffalo skins, but was expressly forbidden to trade with the Ottawas or other lake tribes who had been accustomed to bring furs to Montreal. With Tonty, an Italian veteran, and 30 mechanics and mariners, he sailed from La Rochelle on July 14, and proceeded to Fort Frontenac. He sent Tonty to establish a post near the mouth of the Niagara, gained the good will of the Senecas, and began to build a vessel of 55 tons, above the falls, apparently at Cayuga creek. The Griffon was launched in 1679, and in August he embarked with his expedition, including three Franciscans. He sailed through Lakes Erie, St. Clair, Huron, and Michigan to Green bay. As his creditors had during his operations been proceeding against him, he unwisely collected furs in defiance of the terms of his grant, and sent back a load by the Griffon to meet their claims. His party then proceeded in canoes to the mouth of the St. Joseph's river, where he established a trading house, called Fort Miami. He then ascended the St. Joseph's, crossed to the Kankakee, and sailed down till he reached an Illinois village. He formed an alliance with the tribe, and in January, 1680, began near the present Peoria a post which he called Fort Crèvecoeur. The Griffon never returned from her voyage down, and La Salle was deprived of much that he

needed for his explorations. After putting Tonty in command at his fort, and despatching Acau and Hennepin to explore the Illinois to its mouth, he himself started back for Canada with five companions. From the mouth of the St. Joseph's he struck across Michigan to a river flowing into the Detroit, crossed that river, made his way overland to Lake Erie, and then proceeded in a canoe to his post at Niagara. Here he was convinced that the Griffon had perished, and heard of the loss of a ship on its way from France with supplies. Arranging his affairs as best he could, he made up a fresh party, and started back for Fort Crève-cœur with supplies; but on arriving he found that Tonty, by the attack of the Iroquois on the Illinois, and by the desertion of his men, had been forced to abandon the post and retire to Green bay. La Salle went down the Illinois to its mouth, and returned to gather his followers and obtain resources to renew his exploration, although De la Barre, Frontenac's successor, was openly hostile to him and aided his enemies. At last, Dec. 21, 1681, he started from Fort Miami with his expedition, ascended the Chicago, crossed to the Illinois, and descended to the Mississippi. Sailing down, he camped on the first Chickasaw bluff, stopped at the Arkansas villages, and kept on till the river divided. He explored the three channels to the gulf, and on April 9, 1682, set up a column with the French arms at the mouth, and took formal possession of the country watered by the river. Returning, he began Fort St. Louis at Starved Rock, on the Illinois, and in November, 1683, reached Quebec, leaving Tonty in command in the west, with instructions to meet him at the mouth of the Mississippi. He then proceeded to France, and proposed to the government to begin a settlement there, and to undertake the conquest of New Biscay and the rich mining country of northern Mexico. By patent of April 14, 1684, he was appointed commandant of all the country from Fort St. Louis, in what is now the state of Illinois, to New Biscay. An expedition consisting of 280 persons, most of them ill chosen, sailed from Rochefort on Aug. 1, in four ships; but dissensions at once sprang up between La Salle and Beaujeu, the naval officer in command of the vessels. After stopping at Santo Domingo, they entered the gulf of Mexico, but, miscalculating distances, passed the mouth of the Mississippi, apparently on Jan. 10, 1685. As they advanced, La Salle, convinced that they had gone too far, wished to return, but Beaujeu went on. They finally anchored off the entrance to Matagorda bay. Here La Salle disembarked his colonists, but his store ship *Aimable*, containing most of his munitions, was run on an island and wrecked. Beaujeu, pleading a want of provisions, soon after sailed off with two vessels, leaving La Salle with the *Belle*, a small vessel given him by the king. La Salle then threw up a fort called St. Louis, and attempted to cultivate the

soil. The Indians showed hostility from the first. Some of the settlers were killed, others perished from diseases and imprudence. La Salle lost time and men in excursions through the country; the *Belle* was wrecked; and after the lapse of two years the whole party, in January, 1687, was reduced to fewer than 40. Leaving half of these, including the women and children, in the fort, La Salle set out on Jan. 7 to make his way to the Illinois, with his brother, his nephews, Joutel, and 12 others. He had already visited the Ceniz or Assinai, and now pushed on for their towns. He had crossed the intervening rivers and reached the Trinity, when a long smothered revolt broke out. Duhant and Larchevêque killed Morangé, a nephew of La Salle; and when the commander turned back to look for his relative, they shot him down, and as they looked at the body cried, "There, you grand bashaw, there you are!" The murderers soon after quarrelled among themselves, and Joutel with the Cavaliers and four others, started on, and finally reached a French post on the Arkansas. Of those left at Fort St. Louis nearly all were massacred by the Clamcoet Indians, the few survivors falling into the hands of a Spanish force sent to drive out the French.—The career of La Salle was, in and immediately after his day, the subject of conflicting statements, and controversies have been maintained to this day. Hennepin, Le Clercq, Joutel, and Tonty gave contemporaneous statements; and in recent times the subject has been specially treated by Sparks, "Life of La Salle;" Shea, "Discovery of the Mississippi;" Parkman, "Discovery of the Great West;" and Gravier, *Découvertes et établissement de Cavalier de la Salle*.

**LAS ANIMAS**, the S. E. county of Colorado, bounded E. by Kansas, S. by Indian territory and New Mexico, and W. by the Rocky mountains; area, about 7,000 sq. m.; pop. in 1870, 4,276, chiefly Mexicans. It is watered by the Las Animas or Purgatory river and by branches of the Arkansas. The valley of the Purgatory is very fertile. The *mesas* or table lands afford excellent pasturage. The chief productions in 1870 were 5,930 bushels of wheat, 2,952 of Indian corn, and 10,650 lbs. of wool. The value of live stock was \$31,801. Capital, Trinidad.

**LASAUUX, Ernst von**, a German philologist, born in Coblenz, March 16, 1805, died in Munich, May 10, 1861. He was the son of an architect, studied in Bonn and Munich, spent some time in Rome and the East, and was professor of philology at Würzburg from 1835 to 1844, and subsequently at Munich. In the Bavarian chamber he was conspicuous as an ultramontane. His principal works are: *Der Untergang des Hellenismus* (Munich, 1854); *Ueber die theologische Grundlage aller philosophischen Systeme* (1856); and *Die Philosophie der schönen Künste* (1860).

**LASCARIS, I. Andreas Joannes**, surnamed RHYNDACENUS, a Greek philologist, born on the banks of the Rhyndacus in Phrygia about

1445, died in Rome in 1535. He belonged to a family which counted among its members three Greek emperors reigning at Nicæa, viz.: Theodore I., 1206-'22; Theodore II., 1255-'9; and John IV., 1259-'61. He went to Italy on the final overthrow of the Byzantine empire, and found a refuge at the court of Lorenzo de' Medici, who sent him twice to Greece to collect valuable manuscripts. Before his return the second time Lorenzo died, and Lascaris, at the invitation of Charles VIII. of France, removed to Paris about 1495, and began to teach Greek publicly. In 1503 and 1505 Louis XII. sent him as ambassador to Venice; and on the rupture between France and Venice in 1508 he remained there as a private citizen. In 1513, on the invitation of Leo X., he took charge of the Greek college and press lately founded in Rome, and published editions of many of the Greek classics. In 1518 he returned to Paris, and assisted Budeus in forming the royal library at Fontainebleau. He was subsequently sent to Venice to procure Grecian youths to officiate in the Greek college contemplated by Francis I. Paul III. importuned him to return to Rome, and he died a few months after his arrival there. He edited the works of several of the Greek poets, and translated into Latin some military treatises of Polybius.—See Villemain, *Lascaris* (Paris, 1825). **II. Constantine**, a Greek grammarian, of the same family with the preceding, born in Constantinople, died in 1493. On the capture of his native city by the Turks he repaired to the court of Francesco Sforza, duke of Milan, who intrusted him with the education of his daughter. He taught Greek and rhetoric in Rome and Naples, and subsequently established in Messina a school which enjoyed great celebrity while he lived. He bequeathed his library and manuscripts to the senate of Messina. These were afterward carried to Spain, and are still preserved in the Escorial. His *Grammatica Græca* (Milan, 1476) was the first Greek book printed in Italy.

**LAS CASAS, Bartolomé de**, the apostle to the American Indians, born in Seville, Spain, in 1474, died in Madrid in July, 1566. His father accompanied Columbus both on his first and second voyages, and on the latter of these took with him his son, then 19 years of age, who till that time had pursued his studies with brilliant success at Salamanca. Bartolomé went also on the third and fourth voyages of Columbus. On his return to Spain he entered the order of the Dominicans, with a view of being employed as a missionary to the Indians. He went to Santo Domingo in 1502, was ordained there in 1510, and celebrated the first high mass that had ever been heard from a priest ordained in the new world. Two years afterward he accompanied Velasquez to Cuba as his chaplain, and attracted attention by the influence which his mildness and charity gained over the native population. He entered with

zeal into the interests of the unfortunate Indians oppressed by their European conquerors, and in 1515 sailed for Spain to obtain for them measures of redress. Cardinal Ximenes, who in the following year became regent, sent out three Hieronymite monks to correct the abuses complained of; but the efforts of this commission not satisfying the devotion of Las Casas, he soon returned again to Spain for stricter and more efficient regulations, and was appointed "universal protector of the Indies." At last, to save the Indians from the complete extermination which threatened them, Las Casas, who had seen the African thriving and robust beneath the sun of Hispaniola, proposed the introduction of negro slaves to labor in mines and on sugar plantations; and relieve the natives. The plan which benevolence had suggested was quickly caught up by the colonists, the traffic in negroes became a lucrative commerce, and the servitude of one race was only given up for that of another. Seeing the failure and perversion of his plan, Las Casas formed the project of establishing a colony under his own guidance, and obtained from Charles V. the gift of 270 leagues of land on the coast of Venezuela for this purpose. This plan too failing after a short trial, he retired for a time in despair to the Dominican convent at Santo Domingo. In 1527 he went as missionary and preacher through the provinces of Nicaragua and Guatemala, and into Peru and Mexico; after which in 1539 he returned to Spain to explain to the emperor the situation of the Indies and to obtain from him new reforms. Charles V., wishing to reward him for his many labors, appointed him to the rich bishopric of Cuzco. Las Casas declined this appointment, but accepted the next year the much poorer bishopric of Chiapas, in Mexico; and at the age of 69 years he left Spain for the eighth time. His zeal in behalf of the Indians provoked a hostile attack from Sepulveda, an officer of the Spanish court, who undertook to justify the conduct of the Spaniards. To defend himself Las Casas wrote his work upon the destruction of the Indies, which contained many particulars of cruelties by the colonists, and was translated into several European languages. He met with difficulties in the administration of his bishopric, and having refused the sacraments to those of the colonists who reduced the Indians to slavery, he drew upon himself not only the hostility of the planters, but also the disapproval of the church. Abandoned by all, he returned finally to Spain in 1551, after having during 50 years signalized in America his zeal and his virtues. He retired to the convent of St. Gregory in Valladolid, and devoted the remainder of his life to various compositions, one of the most valuable of which, his "General History of the Indies," commenced in 1527, has never been published. Several other works in Spanish, and two in Latin, also remain unpublished. The printed works were published in 1 vol. 4to (Seville, 1552). Several of his works were edited by

Llorente, and published in Spanish and French, each edition in 2 vols. 8vo (Paris, 1822).

**LAS CASES, Emmanuel Augustin Diendonné**, seigneur de la Caussade and count de, a French historian, and companion of Napoleon at St. Helena, born at the château of Las Cases, near Revel, Languedoc, in 1766, died at Passy-sur-Seine, May 15, 1842. He was educated at the school of the Oratorians in Vendôme, and at the military and naval schools of Paris, and served in the navy, becoming lieutenant at the age of 21. When the revolution broke out he took part with the royalists, emigrated, and was employed by the prince of Condé in many diplomatic missions, among others to Gustavus III. of Sweden, then at Aix-la-Chapelle, who became his friend. After the defeat of the Prussians in Champagne he fled to London, where he supported himself by teaching. When the *émigrés* were recalled by Napoleon, Las Cases returned to Paris, and for some time lived in obscurity. But he was appointed chamberlain of the emperor in 1808, and in 1809 entered the army of Bernadotte. In 1810 he was appointed master of requests in the council of state, and in 1811 intrusted with the liquidation of the Austro-Illyrian debt. In 1812 he was appointed inspector of prisons, hospitals, and similar institutions, and of all the ports and naval stations from Toulon to Amsterdam. After the disasters of Moscow and Leipsic, Las Cases commanded the 10th legion of the national guard. In 1814 he opposed Napoleon's abdication, and went to England, whence he subsequently sent in his adhesion to the Bourbons. After the return from Elba he went back to France, and after Waterloo followed Napoleon to St. Helena. Here with his son he devoted himself to the care of the emperor, and passed his evenings in recording his remarks. Having written a letter to Lucien Bonaparte commenting on the treatment to which Napoleon was subjected, he was arrested, Nov. 27, 1816, and sent to the Cape of Good Hope, where he was confined eight months. He was taken to England, but not suffered to land, and afterward conducted to Frankfort, where he at last received his liberty after 13 months' captivity. He afterward resided in Belgium, but it was not until the death of Napoleon that he was allowed to return to France. He now published his St. Helena notes, which are said to have yielded him 2,000,000 francs. He was elected in 1831 and 1839 to the chamber of deputies, taking his seat with the ultra opposition. Besides his *Mémorial de Sainte-Hélène* (8 vols., 1822-'3), he composed an *Atlas historique et géographique* (1803-'4), and an autobiography entitled *Mémoires d'E. A. D., comte de Las Cases, communiqués par lui-même* (1819).

**LAS CENZAS** ("the ashes"), a volcano in Guatemala, Central America, one of the group known as the volcanoes of Pacaya, in lat. 14° 21' N., lon. 90° 36' W., 19 m. S. W. of the city of Guatemala; altitude, 5,100 ft. It has not been

in a state of destructive eruption since 1776, in which year it destroyed the village of Tres Rios, 9 m. distant, filling up three considerable rivers, from which the village took its name.

**LASKER, Eduard**, a German statesman of Jewish parentage, born at Jarocin, Posen, Oct. 14, 1829. He studied in Breslau, and found employment in the judiciary service at Berlin, with which he resumed his connection in 1856, after having passed some time in London in studying English jurisprudence. He became known as a statesman by his work on the constitutional history of Prussia (new ed., Leipsic, 1873), and as a member since 1865 of the Prussian chamber, and subsequently of the North German and German imperial parliaments. He was one of the founders of the national liberal party, and promoter of the union of the southern and northern states of Germany (1866-'70). He is now (1874) the foremost leader in the Reichstag, and a powerful supporter of Bismarck's policy.

**LASKI, Jan**, commonly known as JOHN À LASCO, a Polish divine, born in Warsaw in 1499, died in Pinczów, Jan. 13, 1560. He was descended from a noble family, and had an uncle who was an archbishop. He entered the church, and rose to the rank of bishop; but having made the acquaintance of Zwingli and other reformers, he became a Protestant, and resigned his bishopric in 1537. After founding at Emden the first Protestant church in that region, he went to London in 1549, where he had charge of a foreign Protestant congregation. Being compelled to leave England on the accession of Mary in 1553, he went to Frankfort, where he organized the society of Protestant refugees from England and the Netherlands. He returned to his native country in 1556, became the head of the Protestant church in Little Poland, and exerted himself especially to bring about a union of all the Protestant churches of Poland. He left a large number of theological works.

**LAS PALMAS.** See PALMAS.

**LAS PILAS**, one of the great extinct volcanoes which constitute the volcanic chain of the Marrabios, extending across the plain of Leon, in Nicaragua. It is broad and comparatively low, but has a vast crater surrounded by many smaller craters, or ancient vents. It was near the foot of this volcano, in the plain of Leon, that a volcanic orifice opened on April 12, 1850, around which was speedily accumulated a great mass of lava, cinders, stones, and ashes, forming a cone several hundred feet in height, which by its accretions promised to add another high volcano to those which stud the plain. The eruption ceased however at the end of a month, and has not since been renewed.

**LASSA**, or **H'Lassa**, a city of Asia, capital of Thibet, situated in a fertile plain on an affluent of the Sanpo or Dzang-bo-tzin, in lat. 30° 48' N., lon. 91° 25', 600 m. N. N. E. of Calcutta; pop. about 50,000, a large portion of whom are Buddhist priests or lamas. The streets are

in general wide and regular, and the houses, whether constructed of mud, brick, or stone, have their walls whitened, and their doors and window frames painted red and yellow. It is surrounded with a wall, and contains some fine public edifices, the chief of which is a lamasery or monastery. Lassa is a place of considerable commerce, and the resort of merchants from all parts of Asia. The most important articles of trade are linens, woollen cloth, cashmere shawls, sable furs, raw silk, musk, sugar, dried fruits, bullion, glass, and cutlery. N. W. of the city, and connected with it by two avenues, is the Buddhala, or "mountain of Buddha," on which stands the palace of the grand lama, a magnificent structure four stories high, crowned by a gilded dome, and supported by columns covered with plates of gold. This is the residence of the dalai lama or grand lama, the Buddhist sovereign pontiff of central Asia. Thither pilgrims resort from all parts of eastern Asia to perform their devotions, and do homage to the supposed incarnation of deity.

**LASSEN**, a N. E. county of California, bordering on Nevada, and intersected in the N. W. by the upper Sacramento; area, 4,932 sq. m.; pop. in 1870, 1,327. It lies E. of the Sierra Nevada mountains, and contains several lakes, the most noteworthy of which is Honey lake, which receives Susan river and Willow creek. The mountain slope is covered with pine forests; at the base are the lakes and meadows, while further E. are sage brush hills and plains. Portions of the county are adapted to agriculture and grazing. The chief productions in 1870 were 12,904 bushels of wheat, 36,497 of oats, 93,926 of barley, 59,494 lbs. of wool, and 9,120 tons of hay. There were 2,022 horses, 1,791 milch cows, 8,000 other cattle, 703 sheep, and 1,657 swine. Capital, Susanville.

**LASSEN, Christian**, a German philologist, born in Bergen, Norway, Oct. 22, 1800. He studied at Christiania, Heidelberg, and Bonn, passed some years in London and Paris, and returned again to Bonn, where he became in 1830 extraordinary and in 1840 ordinary professor. While in Paris he studied the Pali language in connection with Eugène Burnouf, and the result of their joint labors was the *Essai sur le Pali* (1826), published by the Asiatic society. He published with Schlegel the *Ramayana* and the *Hitopadesa*. He was for a time editor of the journal of the German oriental society, and of the *Zeitschrift für die Kunde des Morgenlandes*. His works, which are numerous and valuable, relate to a variety of oriental languages and ancient history, embracing, among other subjects, translations from the Hindoo philosophy, the history of Bactria, Cabool, and India, and cuneiform inscriptions. His principal work is the *Indische Alterthumskunde* (4 vols., 1844-'62; vol. i., 2d ed., 1866), a work of great labor and learning, covering the whole ground of Indian archaeology, mythology, and history.

**LASSO** (Span. *lazo*), a cord in common use in Spanish America for catching wild cattle.

It is a very strong but thin, well plaited rope of raw hide, one end of which is attached to the broad surcingle which fastens together the complicated gear of the *recado* or saddle used in the pampas, and the other terminates in a small ring of iron or brass, by which a noose can be formed. The gaucho, when about to use the lasso, keeps a small coil in his bridle hand, and in the other holds the running noose, which is made very large, generally about 8 ft. in diameter. This he whirls round his head, and by the dexterous movement of his wrist keeps the noose open; then, throwing it, he causes it to fall on any particular spot he chooses. When not in use, the lasso is tied up in a small coil to the after part of the *recado*. The *bolas* is a somewhat similar missile weapon (see **BOLAS**); both have often been used with great effect in war. The chief difficulty in using either lasso or *bolas* is to ride so well as to be able, at full speed, and while suddenly turning about, to whirl it steadily round the head and take aim. On foot any person could soon learn the art. When cattle are caught by the lasso, which is so thrown as to fasten on the horns, they will sometimes gallop round and round in a circle; and if the horse be not well broken, being alarmed at the strain, he will not readily turn like a pivot, in consequence of which men have often been killed; for if the lasso once takes a twist round the rider's body, it will instantly, from the power of the two opposed animals, almost cut him in twain. In Mexico the lasso is called *la reata*; whence the word *lariat* common in the S. W. portion of the United States.

**LASSO, Orlando di**, or **Orlandus Lassus**, a Flemish composer, born in Mons, Hainaut, in 1520, died in Munich, June 14, 1594. He was taken to Italy when a child on account of his fine voice, and until he was grown up was employed as a singer in Milan and Naples. Subsequently he returned to Flanders, settled in Antwerp, and passed the latter part of his life at Munich in the service of the duke of Bavaria. He was a contemporary of Palestrina, and one of the most famous composers of the age, excelling in harmony, and being one of the first to attempt chromatic passages. His secular music, consisting of Latin, Italian, German, and French songs, is better than his compositions for the church, in which he is inferior to Palestrina. A statue has been erected to him in his birthplace. His works were published in Paris in 1576 under the title of *Mélanges d'Orland Lassus*, and in 1584 appeared *Continuation des Mélanges*.

**LASSO CELLS**, the netting organs of aculephs and polyphs, called *cnidæ*. See **ACTINIA**.

**L'ASSOMPTION**, a S. E. county of Quebec, Canada, bounded S. E. by the St. Lawrence river; area, 248 sq. m.; pop. in 1871, 15,473, of whom 14,979 were of French origin or descent. It is watered by the Marcouche, Achigan, and L'Assomption rivers. Capital, L'Assomption.

**LASTEYRIE, Ferdinand Charles de**, count, a French archaeologist, born in Paris in 1810. He is a son of Count CHARLES PHILIBERT DE LASTEYRIE-DUSAILLANT (1759-1849), author of many works on natural history, industry, and education. He was an aide-de-camp of Lafayette in 1830, and was employed in the civil service till 1842, when he became a deputy; and from May, 1848, to Dec. 2, 1851, he was a member of the constituent and legislative assemblies. His principal work, *Histoire de la peinture sur verre d'après ses monuments en France* (fol., 1837-'58), received an academical prize.—His cousin, the marquis ADRIEN JULES DE LASTEYRIE, born in 1810, is a grandson of Lafayette on his mother's side. He protected the duchess of Orleans on Feb. 24, 1848, when she visited the chamber of deputies of which he was a member. He subsequently sat in the assembly till Dec. 2, 1851. In February, 1871, he was elected to the national assembly as a partisan of Thiers.

**LATAKIA** (anc. *Laodicea*), a town of Syria, 120 m. N. of Beyrout; pop. about 7,000. The town is on a rocky promontory, from 100 to 200 ft. high, which projects nearly two miles into the sea, opposite the N. E. point of the island of Cyprus. The harbor is a deep cove, almost surrounded by rocky banks, at the N. W. angle of the promontory, and has a pier on one side and a projecting tower on the other. The town is surrounded by groves of myrtle, pomegranate, mulberry, orange, lemon, and olive trees, and consists of two portions, the upper and lower town. The former occupies an elevated site at a short distance from the sea, and consists largely of modern houses, but is very dirty; the latter, called La Scala, extends along the shore in the vicinity of the harbor. Latakia and Alexandretta are the ports of Aleppo, and a great part of the important trade of that city with the adjoining provinces passes through the former place. The principal articles of export are tobacco, cotton, gall nuts, sesame seed, wool, wax, camels' hair, and several minor products. In 1871 they were valued at \$1,277,599. Grain can be exported only in times of scarcity in Europe, when the prices compensate for the heavy expenses of transportation, and then chiefly to Marseilles. A portion of the Aleppo wool shipped from Latakia finds its way to the United States. The principal article of trade, however, is tobacco of fine quality, of which large

quantities are raised in the neighborhood. There is also a large trade in sponge. Latakia contains numerous remnants of ancient stone structures, and the surrounding cliffs are filled with rock-cut tombs. (See LAODICEA.)

**LATERAN**, the name of a palace and church in Rome, so called from their being built on the estate of Plautius Lateranus, who was put to death by Nero for complicity in the conspiracy of the Pisos. The palace, whose magnificence is celebrated by Juvenal, having become imperial property, a portion of it was given by the emperor Maximian to his daughter Fausta, the second wife of Constantine. This portion, called *Domus Fausta*, was given by Constantine to Pope Melchisedes in 312, and afterward confirmed to St. Sylvester. It became the residence of the popes till their removal to Avignon (1309); it was burned at that epoch, and rebuilt in 1585. Remaining unoccupied, it was converted into an orphan asylum in 1693, and in 1843 became a deposi-

Church and Palace of the Lateran.

tory for works of art for which no room could be found in the Vatican. To this museum Pius IX. added another for works of Christian art. The only remains preserved of the ancient palace after the fire of 1308 are on the north side of the basilica, under a magnificent portico by Fontana. They are: the private papal chapel built by Leo III., the end wall of the banqueting hall or *triclinium*, and the *santa scala*, or holy staircase. This is behind the *triclinium*, and is said to be the staircase of the house of Pilate, ascended and descended by Christ. The tradition is that it was brought from Jerusalem by Helena, mother of Constantine the Great. It was injured and partly cast down by the earthquake of 896, reërected in the old Lateran palace, left uninjured by the fire, and removed to its present site in 1585. It is composed of 28 marble steps, covered by order of Clement XII. with a ca-

sing of wood, which has been repeatedly worn out by the knees of ascending pilgrims. There is no day on which persons may not be seen creeping up on their knees; but in Holy Week, and particularly on Good Friday, they are covered with the multitude of penitents. At the foot of the stairs are fine sculptures of Giacometti, placed there by Pius IX., and representing the *Ecce Homo* and the "Kiss of Judas." On each side is a parallel flight of stairs by which the pilgrims descend. The *santa scala* leads up to the chapel of Leo III., called the *sancta sanctorum*, in which none but the pope can officiate, which no woman can enter, and which is never open to others except on the morning of Palm Sunday. The altar is in a recess, surmounted by a beautiful silver tabernacle, the gift of Innocent III. In this tabernacle is a famous painting (called *Acheirotopeton*) attributed to St. Luke, placed in the chapel by Stephen III. in 753, and said to be an exact likeness of Christ at the age of 12. Outside of the *santa scala*, to the south, is a tribune erected to receive the mosaics which formerly covered the face of the *triclinium*. The originals, injured by the fire, are in the Vatican; but copies made by order of Benedict XIV. represent the mission of the apostles, Christ delivering the keys to St. Sylvester and the labarum to Constantine, and Peter bestowing on Leo III. the pallium and on Charlemagne a banner.—A basilica, or hall of justice, adjoining the Lateran palace, was, according to some, assigned by Constantine for Christian worship; but according to others, Constantine had a church built there, working at it with his own hands, and it was consecrated Nov. 9, 324, under the title of St. Savior. This church was overthrown by an earthquake in 896, rebuilt by Sergius III. (904-'11), dedicated to St. John the Baptist in 1114, and decorated afterward by Giotto; but it was destroyed by fire in 1308, and rebuilt to be burned down again in 1360. Urban V. restored it in 1364; it was afterward altered, enlarged, mutilated, and embellished under various pontiffs, till it was completely modernized in 1559. As it now exists, this basilica is 408 ft. long, with five aisles of equal elevation, and a flat ceiling profusely and tastelessly decorated by Borromini. The principal front, constructed by Alessandro Galilei in 1734, is considered the finest in Rome. The portico is 33 ft. deep and 174 ft. wide. The central entrance is ornamented with two bronze doors said to have belonged to the ancient temple of Saturn. Above it is the balcony from which the pope gives his solemn benediction on great festivals. To the right of the portico is the *porta santa*, opened only in the year of jubilee; and to the left is a statue of Constantine discovered in the ruins of the *Thermae*. This church has always been considered the cathedral of the bishops of Rome, and the central seat of their jurisdiction; it therefore takes precedence of

all other churches in Rome and the Catholic world. The chapter of St. John Lateran, in like manner, takes precedence over that of St. Peter's. Every pope is crowned there, as in his proper seat. Over the west front is the inscription, *Sacrosancta Lateranensis ecclesia, omnium urbis et orbis ecclesiarum mater et caput*. The wooden table on which St. Peter, according to tradition, celebrated mass in the house of the senator Pudens, is enclosed in the high altar, on which no one but the pope is allowed to celebrate; and there, too, as is believed by Catholics, are enshrined the heads of Sts. Peter and Paul. Five general councils have been held under its roof. Adjoining the basilica during the middle ages were a monastery of canons regular and a celebrated school; the beautiful 12th century cloisters of the monastery are still in-existence. Near them is the baptistery, or church of San Giovanni in Fonte, said to have been erected by Constantine, but more probably by Sixtus III. (432-'40). In front of the basilica is the largest known monolith, an obelisk of red granite covered with hieroglyphs, 150 ft. high with its pedestal, raised in memory of Thothmes IV., brought from Heliopolis to Alexandria by Constantine, and thence to Rome by Constantius.

**LATERAN, Councils of.** Eleven councils of great historical importance have been held in the Lateran basilica, of which the five following are considered by Roman Catholic jurists as œcumenical. I. The ninth œcumenical (or the tenth, if the council of Jerusalem is included in the list) and the first general council held in the West, convened by Calixtus II., who presided over it. It opened March 18, and closed April 5, 1123. There were present 300 archbishops and bishops, and 600 inferior prelates. The chief object of the convocation was to terminate the long quarrel about investitures by promulgating the concordat concluded at Worms between the pope and the emperor Henry V., Sept. 23, 1122. In this it was stipulated: 1, that elections to ecclesiastical dignities in Germany should be held in presence of the emperor or his delegates, without violence or simony, and that the prelate elect should receive by the delivery of the sceptre, the symbol of temporal rule, the investiture of his temporalities; 2, that the emperor renounce all claim to invest with the ring and crosier, the symbols of spiritual jurisdiction; 3, that the emperor grant to all churches within his domains perfect freedom in canonical elections, and pledge himself to protect the Roman see against all enemies. Twenty-two canons were also published against simony, concubinage, and all who coin or circulate counterfeit money. II. The tenth general council, convened by Innocent II., who presided over it. It opened April 20, 1139. About 1,000 prelates were present. It condemned the antipope Anacletus II. and his chief supporter, Roger II. of Sicily, and anathematized the doctrines and adherents of

Arnold of Brescia, of Peter de Bruys, and of the Manichaean heresy. **III.** Convened by Alexander III. to give effect to the peace concluded at Venice between himself and Frederick I. in 1177. Three sessions were held, March 2, 14, and 19, 1179, and 27 canons were enacted. It was decreed that in papal elections a two-thirds vote of all the cardinals assembled should be necessary for a valid choice; that no candidate for the episcopal office could be validly chosen till he had completed his 30th year, and that he must be born in lawful wedlock, and of blameless life and doctrine; that for inferior ecclesiastical dignities the candidate must be 25 years of age, and receive holy orders within a specified time, under pain of forfeiture; that no money or presents should be either asked or accepted for the consecration of prelates, or their installation, for marriage or funeral fees, or for the administration of any sacrament; that in all cathedrals and principal churches masters should be maintained to teach gratuitously, and free schools should be opened in all churches and monasteries where a provision for free education had formerly been made. Tournaments at fairs are forbidden; the "truce of God" must be strictly observed; lepers must be carefully provided for, churches, cemeteries, and priests must be set apart for them, and they shall be exempt from taxation and all other public burdens. The 27th canon anathematizes the Catharists and Waldenses. **IV.** The fourth Lateran council is thought to be the most important ecclesiastical assembly ever held in Christendom. It was convened by Innocent III., opened Nov. 11, 1215, and closed Nov. 30, although sessions were held in January, 1216. Innocent III. presided. There were present 71 archbishops, 412 bishops, 800 abbots, three eastern patriarchs, with the representatives of the others, and the ambassadors of all the Christian sovereigns. In the first session a solemn profession of faith was presented by the pope and accepted. In it the term "transubstantiation" was first used regarding the change in the eucharistic bread and wine. All heresies contrary thereto were anathematized; and it was decreed that all known heretics, after their condemnation by an ecclesiastical tribunal, should be delivered over to the secular arm; all abettors of heresy are excommunicated, and all dignitaries who do not use their endeavors to rid their domains of heretics are threatened with the same penalty. Next come decrees tending to conciliate the eastern churches, and establishing the order of precedence between the great patriarchates. Bishops are enjoined to reform all abuses and scandals among clergy and laity; and they are to choose none but edifying ministers of God. The decrees about free schools in the principal churches are renewed, and to them is added the obligation of maintaining gratuitous courses of instruction in theology and Scripture. New canons prescribe the obligation incumbent on all without ex-

ception of confessing their sins once a year and receiving the eucharist at Easter. Marriage is forbidden between persons related in the first four degrees of consanguinity. The canons regulating ecclesiastical elections are insisted on, the existing religious orders are to be strictly reformed, and no new ones introduced. The last and most earnest measures of the council and the presiding pontiff were taken for the relief of Palestine. It was agreed by the representatives of the Christian powers that the crusading armies should rendezvous at Brindisi and Messina on June 1, 1217. Meanwhile bishops and priests were to preach the crusade unceasingly. The pope bound himself to limit his personal expenses, and to furnish 30,000 livres as his first contribution; the clergy were to give the 20th part of their income for three years, and the cardinals the 10th, under pain of excommunication. **V.** Reckoned as the nineteenth oecumenical council, convened by Julius II. for the purpose of counteracting the influence of the schismatical assemblage called in Pisa in 1511 by a portion of the cardinals acting under the orders of the emperor Maximilian and of Louis XII. of France. The council was opened May 3, 1512, by Julius in person. There were present in the first session 15 cardinals, the patriarchs of Alexandria and Antioch, 10 archbishops and 56 Italian bishops, a large number of inferior prelates, and the ambassadors of Spain, Venice, and Florence. Later the other sovereigns sent their representatives, and permitted their subject bishops to attend the council. On May 17 articles of confederation between the pope and the king of England were read. In the session of Dec. 3 France was laid under an interdict. The pope, whose health was failing, promulgated a decree about papal elections, excluding the council from all participation therein, and invalidating every choice made by the cardinals under the influence of simony, even when followed by coronation and recognition by the states of Christendom. Leo X. presided over the last sessions of the council, in which the schismatic cardinals were reconciled to the church, and a bull was read Dec. 19, 1516, condemning the pragmatic sanction of Charles VII. of France, and substituting therefor a concordat concluded with Francis I. The council was closed March 16, 1517.—The dates and principal acts of the Lateran councils not considered general were as follows: 1. Convened Oct. 5, 649, concluded Oct. 31, under Martin I. There were 500 bishops present. The Monothelite heresy, the *Ecthesis* of Sergius of Constantinople (639), and the *Typus* of the emperor Constans II. (648), were condemned. 2. Convened Dec. 23, 864, by Nicholas I., and concluded in January, 865. It condemned Rodoald, bishop of Porto, and Zachary, bishop of Anagni, papal legates in Constantinople, for supporting the intrusion of Photius in 861. 3, 4, and 5, in 1105, 1111, and 1112, respectively, were con-

vened by Paschal II. during his quarrel about investitures with the emperor Henry V. 6. Convened in March, 1167, by Alexander III., to excommunicate and depose the emperor Frederick I. Two other convocations, reckoned as councils by some authors, were held in the Lateran respectively in 900, to annul the sentence of deposition on Aargrine, bishop of Langres, and in 993, to celebrate the first known solemn canonization, that of St. Udalric, bishop of Augsburg.

**LATHAM, John**, an English ornithologist, born at Eltham, Kent, June 27, 1740, died in Romney, Feb. 4, 1837. In 1763 he commenced the practice of physic in Dartford. He early applied himself to the study of natural history, and aided Sir A. Lever in forming his museum. He became a fellow of the royal society in 1775, and was one of the founders of the Linnæan society. In 1796 he retired from practice. He is the author of a "General Synopsis of Birds" (6 vols., 1781-75; 2 vols. additional, 1787-1801), and an *Index Ornithologicus* (1791). A new edition of his works in 10 vols. 4to, enlarged and rearranged, with a general index, under the title of "General History of Birds," was commenced in 1821, and completed in 1824. The plates of this, as of his former works, were executed or retouched by himself. He also wrote papers on medical science and natural history.

**LATHAM, Robert Gordon**, an English philologist and ethnologist, born at Billingborough, Lincolnshire, in 1812. He was educated at Cambridge, and subsequently took the degree of M. D. He then travelled in northern Europe, and while in Norway studied the idioms of the Scandinavian tongues. Upon his return to England he published a translation of Bishop Tegnér's poem, "Alexis and Frithiof" (1839); "Norway and the Norwegians" (2 vols., 1840); an "Abstract of Rask's Essay on the Sibilants;" and an "Address to the Authors of England and America," the object of which was to effect a modification of the existing alphabet. In 1840 he was appointed professor of English literature in University college, London, and while so engaged he published a series of works on the English language. The chief among these was his "Treatise on the English Language" (2 vols., 1841), of which a number of editions have appeared. He next gave his attention to ethnology, and published "Natural History of the Varieties of Mankind" (1850), and "Man and his Migrations" (1851). He has also published "Ethnology of the British Colonies" (1851), "Ethnology of Europe," "Ethnology of the British Islands," "Descriptive Ethnology" (2 vols., 1859), "Nationalities of Europe" (1863), and several other works. In 1853 he commenced a new edition of Johnson's dictionary, the last number of which was published in 1870. He has produced an edition of the *Germania* of Tacitus, with notes historical and philological (1850), and has read many important papers before the British association for the advancement of science. As a

physician he has held a high position, and lectured on medical jurisprudence at the school of the Middlesex hospital.

**LATHBURY, Thomas**, an English clergyman, born in 1798, died Feb. 11, 1865. He was educated at Oxford, and became incumbent of the parish of Sts. Simon and Jude, Bristol, in 1848. He wrote a "History of English Episcopacy" (1836), "State of Popery and Jesuitism in England" (1838), "History of the Spanish Armada" (1840), "History of the Convocation of the Church of England" (1853), and "History of the Book of Common Prayer" (1858).

**LATHROP, John Hiram**, an American educator, born at Sherburne, Chenango co., N. Y., Jan. 22, 1799, died at Columbia, Mo., Aug. 2, 1866. He graduated at Yale college in 1819, and was tutor at that institution from 1822 to 1826, when he was admitted to the bar and commenced practice at Middletown. But education was his chosen field, and after teaching at Norwich, Vt., and Kennebec, Me., he became in 1829 professor of mathematics and natural philosophy in Hamilton college, Clinton, N. Y., and in 1835 of law, history, church polity, and political economy. In 1840 he became president of Missouri state university, in 1849 first chancellor of Wisconsin university, and in 1859 president of Indiana state university, which post he resigned in 1860 and returned to Missouri university as professor of English literature. He was reelected president in 1865, and held that office till his death. His published addresses elaborately discuss questions connected with advanced education.

**LATHROP, Joseph**, an American clergyman, born in Norwich, Conn., Oct. 20, 1731, died in West Springfield, Mass., Dec. 31, 1820. He graduated at Yale college in 1754, and taught school at Springfield, Mass., at the same time studying theology under the direction of the Rev. Robert Breck. In August, 1756, he was ordained pastor of the Congregational church in West Springfield, where he preached regularly till 1818. He received the degree of D. D. from Yale college in 1791 and from Harvard university in 1811. In 1792 he was elected a fellow of the American academy of arts and sciences. He was often called upon to settle ecclesiastical difficulties. His publications consist mainly of discourses which he had delivered from the pulpit (7 vols., with an autobiography, 1796-1801).

**LATIMER, Hugh**, an English bishop and reformer, born at Thurcaston, Leicestershire, about 1490, burned at the stake in Oxford, Oct. 16, 1555. The son of a farmer, he was sent to the university of Cambridge when about 14 years of age, was chosen a fellow of Clare Hall in 1509, and received the degree of M. A. in 1514. He then began the study of divinity, and obtained the baccalaureate of theology by a sharp disputation against the doctrine of Melancthon, but became a Protestant about 1520, chiefly through the influence of Bilney. In 1527 he delivered a sermon in presence of the

bishop of Ely and numerous priests, in which he drew a contrast between Christ as the exemplar and the English prelates of the day. For this he was forbidden by the bishop to preach in the churches of Cambridge university, but being summoned before Wolsey was dismissed with merely a gentle admonition, and was licensed to preach in any church throughout England. In 1529 he preached two sermons at Christmas "On the Card;" making the practice of card-playing at that festival an occasion, after the taste of the time, to deal out Christian cards, "hearts" to be "trumps." In these sermons he defended the doctrines of the reformation, inveighed against indulgences, and showed the uncertainty of tradition and the need of the Bible in the language of the people. The disturbance which this occasioned was settled, after investigation before the vice chancellor, by binding both him and his opponents to abstain from offensive expressions against each other in the pulpit. In the following year he favored the divorce of Henry VIII. from Catharine, and was appointed one of the royal chaplains, but remonstrated against the king's inhibition of all English books containing any matters of Scripture. Appointed to the living of West Kington, Wiltshire, he travelled extensively, everywhere occasioning excitement and complaints by his sermons. In 1532 he was prosecuted before the bishop of London, the archbishop of Canterbury, and the convocation, and was at first excommunicated, but was ultimately relieved of all penalties on condition of signing a portion of the articles proposed to him. On the elevation of Cranmer to the primacy in 1533, Latimer was recalled to his royal chaplaincy, and preached before the king on all the Wednesdays of Lent in 1534. He was consecrated bishop of Worcester in 1535, and in 1536 opened the convocation with two of his boldest sermons. Devoting himself with great diligence to his special episcopal duties, he did not again appear prominently till in 1539 he resigned his see on the passage of the six articles making it penal to impugn transubstantiation, communion in one kind, celibacy, the lawfulness of monastic vows, private masses, and auricular confession. He lived in great privacy till an illness required him to seek medical aid in London, where he was discovered by Gardiner's spies, and was imprisoned from 1541 to 1547. After the accession of Edward VI. he declined, probably on account of ill health, to receive back his bishopric, which was offered him at the instance of the house of commons. He took little part in the public direction of the reformation; but, as the popular favorite, he did more than any other man to prepare the way for it in the hearts of the people. After the accession of Mary he was apprised of his danger, and time was allowed him for escape; but he refused to avail himself of the opportunity, and was committed to harsh confinement in the tower. In 1554 he was conveyed to Oxford with Cran-

mer and Ridley, to hold a disputation on the subject of the mass with several doctors from the universities. He pleaded that he was old, sick, and had used the Latin tongue but little for 20 years; he was therefore permitted to give in a long profession of faith in writing, for which he was condemned as a heretic, and imprisoned during more than a year in Bocardo, the common jail of Oxford. He was then summoned again before the commissioners, but refusing to recant, was condemned to the stake. The sentence was executed on him and Ridley "without Bocardo gate," opposite Balliol college, where the martyrs' monument now stands. He was led to the stake with Ridley, gunpowder being fastened about his body to hasten his death; it took fire with the first flame, and he died immediately. He exhorted his fellow sufferer: "Be of good comfort, Master Ridley, and play the man; we shall this day light such a candle, by God's grace, in England, as I trust shall never be put out." Latimer was rather remarkable for piety and eloquence than for learning and ability. The latest edition of his sermons, by the Rev. G. E. Corrie, was published in London in 1845, in 4 vols. 8vo. His biography has been written by the Rev. R. Demaus (London, 1869).

**LATIN LANGUAGE AND LITERATURE.** The Latin language is a branch of the Aryan or Indo-European family, and was spoken by the Latins, or inhabitants of Latium, in central Italy, probably as early as 10 or 15 centuries before our era. It became afterward the language of the Roman republic and empire, and was spoken over the entire Italian peninsula; and, with some inevitable corruption, it was so universally adopted in Africa, Spain, Gaul, Britain, and Pannonia that, as Gibbon remarks, "the faint traces of the Punic or Celtic idioms were preserved only in the mountains or among the peasants." It ceased to be a living tongue about the 8th century of our era, when it had given birth to the Romance idioms; but it continued in use as the language of the church, of law, and of learning generally, until within the last two centuries. Even at the present time many scientific works, especially on law and philology, are written in it. The Pelasgians exercised upon the earliest civilization of Latium an influence similar to that which they had on Greece. (See GREECE, LANGUAGE AND LITERATURE OF.) The Tyrrhenian and Arcadian Pelasgians, and the Epirotic Græci or Graii, the general term by which the Romans designated all the Greeks, may all be included under the name of Latini, whose prehistoric age is designated by the terms *aborigines* or *casei*. The best evidence for the early existence of Pelasgians in Italy is the Latin language itself, which evinces a closer relationship to Greek than to any other known tongue. The Latins themselves had no definite tradition of it, though some ancient authors attempt to establish a derivation of Latin from the Æolic dialect of Greek. Latin con-

tains also a very considerable number of foreign words and forms which cannot be resolved into Greek elements. Niebuhr was probably the first who succeeded in separating the Greek from the non-Greek elements. Lange, Lassen, Müller, Döderlein, Mommsen, Aufrecht, Kirchoff, Corssen, and G. Curtius have made these differences clearer. Like the Hellenes, the Latins remodelled the linguistic material imported by the Pelasgians, according to their own needs and under the influence of the languages spoken in the surrounding districts of Italy. (See ITALIC RACES AND LANGUAGES.) During the first 500 years of the existence of Rome, Latin was thus developed into a peculiar idiom without experiencing the guidance of a native literature; there is therefore nothing whereby the internal history of the formation of the Latin language can be traced. Dated inscriptions of high antiquity are also exceedingly rare; the oldest are those of Scipio Barbatus at Luceria, or of the second half of the 5th century of the city. During the long period of nearly eight centuries, from about 250 B. C. to A. D. 500, while Latin was a living tongue and had a literature, it experienced comparatively few grammatical changes. Some archaic endings of nouns and verbs in declension and conjugation were eliminated during the classic period, but otherwise the grammar maintained great stability. The vocabulary, however, was constantly enriched. Some writers took great pleasure in forming new words, many of which met with general adoption and came to be used in place of other words, which gradually disappeared. Latin was in its highest perfection in the 1st century B. C., and afterward deteriorated. Disputations were then made about the classicism or Latinity (*latinitas*) of words and phrases. *Latinitas* was probably the colloquial language of the higher classes, in distinction from the archaisms and mutilations of the uncultured. A people which owed its entire literary culture to foreign lands, and which constantly came in contact with foreign nations, necessarily adopted a multitude of foreign words into its vocabulary. With the beginnings of a literature came also an influx of Greek expressions, not only for objects of art and science, as *theatrum*, *tragedia*, *philosophia*, *grammaticus*, but also for common household utensils, as *amphora*, *abacus*, and *aulæum*. By taking up a dictionary and looking over the words beginning with *chamæ*, *chrys*, *cy*, *dia*, *ep*, *eu*, *h* (especially *hy*), *leuc*, *meso*, *mono*, *my*, *nyct*, *orth*, *oxy*, *pseudo*, *sym*, *syn*, *th*, *z*, and *z*, one may easily gain an idea of the vast number of Greek words which the Latin language contains. Hebrew, Syriac, Punic, Persian, and Parthian words were also incorporated, but not as largely as Celtic expressions acquired with the conquest of Gallic lands. Germanic terms also make their appearance during the time of the empire; a few, as *ballux*, a grain of gold, *gurdus*, stupid, and *lavrez*, a rabbit, are said to be of Spanish (probably

of Iberian) origin; and *mastruca*, fur, according to Quintilian, is a Sardinian word. Nevertheless, excepting what Latin has borrowed from Greek, it contains remarkably little of foreign origin; and in spite of the constant intercourse with foreign lands and nations, it always retained its own original structure and composition.—The history of the Latin alphabet, so important on account of its remaining in use in several of the most cultured languages of Europe, has not been completely and accurately retraced. The chief cause of this failure is the lack of written monuments of a date earlier than the 3d century B. C. Cicero and Quintilian say that the Latin alphabet was originally composed of 21 letters, and ended with the letter X; but the earliest monuments exhibit only 20 different characters. Mommsen, F. Lenormant, and other great palæographical scholars are of opinion that the letter which disappeared was Z. The argument is, that the Latin alphabet was formed after the model of the Greek, and that the letter G, subsequently introduced, was put between F and H because the disappearance of the Z had left a gap there. Mommsen considers the character  $\text{Z}$  in the inscription of Milonia to be a Z. It is supposed that the Greek alphabet reached Rome by way of Sicily or from Cumæ. Kirchoff, in *Abhandlungen der Akademie der Wissenschaften zu Berlin* (1863), was the first to perceive that the Æolo-Doric variety of the Greek alphabet, employed in the Chalcidian colonies, was the parent of the Latin characters. The first and second columns of the following illustration seem to establish the opinion. The first notable change in the composition of the alphabet was the reduction of the sibilants S and Z to the single letter S, and of the gutturals C and K to C only. It is evident, however, that C and K did not at first represent the same sound. As in Greek, C was originally a G. It was customary to write K before *a*, instead of C, which stood before the other vowels; thus, *Karthago*, *merkatus*, for the definite orthography *Carthago*, *mercatus*. Otfried Müller suggests that it is due to Etruscan influence that in course of time all gutturals were pronounced hard, which deprived the C of the G sound, and rendered it homophonous with K. Thereafter C rapidly supplanted K, and was generally written for every guttural sound except Q. The need of a G sound soon became apparent again, but as the form C had lately acquired the power of K, another letter was fashioned by a slight appendix to the character C, forming G. The letters Y and Z came late into use to supply articulations of Hellenic words which the Latin alphabet could not indicate. They were not generally employed before the time of Cicero, when they were made to follow the original series of Latin letters.—The pronunciation of Latin, as now taught, is not uniform. Scholars in different countries generally pronounce it substantially as they do their own languages. In the United States, however,

Ancient Latin Alphabets.

two distinct systems are recognized, generally known as the English and the continental methods, using respectively the English and the Italian sounds of the vowels. Neither of these methods renders Latin as the Romans spoke it, the consonants being chiefly mispronounced in either; and though it is now pretty well ascertained what the Roman pronunciation was, yet a change in the common pronunciation of Latin has been found too inconvenient. But it is expected that the difficulties will soon be overcome, and the correct pronunciation be generally adopted. Henry John Roby, in his "Grammar of the Latin Language from Plautus to Suetonius" (2d ed., London, 1872), has an admirable exposition of the sub-

ject. We give a summary statement of the probable pronunciation of educated Romans in the period from Cicero to Quintilian, about 70 B. C. to A. D. 90. The long and short sounds of a vowel, always different in English, were probably identical in quality in Latin: *ā* as in father, *â* as in French *chatte*, not as in *hat*; *ō* nearly as in *dot*; *ō* nearer to English *aw* than the ordinary *o* in *dote*; *ū* like French *ou* in *poule*, nearly as in *pull*, not as in *lull*; *ū* like *oo* in *pool*; *ē* nearly as in *pet*; *ē* the same sound lengthened; *ī* as in *machine*; *ī* the same sound shortened; *y* like German *ü*, but inclining to *i*, somewhat as in *Müller*. The rule for diphthongs is to pronounce the constituent vowels as rapidly as possible in their proper order; thus, *au* as in German *Haus*, and broader than *ow* in *cow*; *eu* as in Italian *Europa*; *æ* as *a* in *bat* lengthened; *æ* as a diphthong; *ei* nearly as in *feint*; *ui* like French *oui*. The diphthongs *ou* and *oi* are found only in early Latin. Of consonants, *c* is always hard, like *k*; *g* always hard as in *give*; *nc* and *ng* like *ngc* and *ngg*, as in *anchor* and *anger*; *j* like *y* in *year*; *v* like *w* in *wine*; *r* always trilled; *s* always sharp as in *hiss*; *bs* like *ps*; *x* like *ks*; *t* always like *tea*; *ph*, *ch*, *th* not like the English *f*, German *ch*, and English *th*, but like *p'h*, *k'h*, *t'h*, the sounds being separately enunciated, or the *p*, *c*, and *t* aspirated, as often heard from Irishmen; and *m* was sometimes not sounded, or perhaps gave only a nasal sound to the vowel. The Romans distinguished between an acute and a circumflex accent. The latter rested only on monosyllables which have long vowels, and in words of more than one syllable on the penultimate, if that contained a long vowel and the final syllable a sharp vowel. Monosyllables always have the accent; dissyllables have the accent on the penultimate, unless they are enclitic; words of more than two syllables have the accent on the antepenult if the penult is short, and on the penult if it is long. Besides accent, the quantity of syllables was distinguished. If the voice dwells upon a syllable, that syllable is called long; if the voice passes rapidly over it, it is called short. Two short syllables are considered to occupy the same time as a long one. A syllable is long or short, either because it contains a vowel naturally long or short, or on account of the position of its vowel. (See W. Corssen, *Ueber Aussprache, Vokalismus und Betonung der lateinischen Sprache*, 2d improved ed., 2 vols., Leipzig, 1868-'70).—In Latin, nouns, pronouns, adjectives, verbs, and some numerals, are inflected; other words are not. The inflexions of nouns, pronouns, and adjectives are in the main the same; those of verbs are quite distinct. The difference between substantives and adjectives is now held to be almost entirely syntactical, and even as such not very great. Inflexions of nouns are always additions to or alterations in the ending of the stem or root of the word. The inflexions for tense, mood, person, number, and voice in verbs are at-

tached to the stem. Sex is attributed to many things which do not really have it; but gender, which is masculine, feminine, or neuter, is never assigned arbitrarily in defiance of the true sex, if of importance. Only singular and plural numbers are distinguished. Distinctions of case are in the singular five, the cases being named nominative, accusative, genitive, dative, ablative; but in some nouns and adjectives of the masculine gender a sixth form, not properly a case in the opinion of many scholars, is found, called the vocative. In the plural there are only four: nominative, accusative, genitive, and a common form for the dative and ablative. Originally perhaps there was a different form for each case in each number. The suffixes for the different cases are usually combined with the final vowel of the stem, so as not always to be readily distinguishable. Declensions are not always regular, and many old and exceptional forms of cases occur. Greek nouns in the pre-Augustan period generally received slight changes, especially of vowels, to adjust them to the Latin usage. Adverbs, prepositions, and conjunctions are indeclinable words; some of them are cases of existing, others of lost words; others again are words with case suffixes different from those in common use in Latin; and still others are mutilated remnants of fuller expressions. In verbs there are two voices, the active and the passive, the latter sometimes called reflexive or middle. Some verbs have both voices, and some have only the active, except in the third person. Others, called deponents, have only the passive, but with the signification apparently of the active. In a few verbs no plural is found. There are three moods, indicative, subjunctive or conjunctive, and imperative; six tenses in the indicative, viz.: three denoting incomplete action, present, future, and imperfect (also called present imperfect, future imperfect, and past imperfect); and three denoting completed action, perfect, pluperfect, and completed future (sometimes called present perfect, past perfect, and future perfect). In the subjunctive there are only four distinct tense forms, present, imperfect, perfect, and pluperfect. Some verbs in the active and all in the passive have only three simple tense forms in the indicative, those of incomplete action, and in the subjunctive only the present and imperfect. The passive voice supplies tense deficiencies by participles in combination with certain tenses of the verb *esse*, to be. Two indeclinable substantives, called infinitives, are usually treated in connection with the verb; also three verbal adjectives, called participles, the present and future, belonging to the active, and the past, to the passive voice; a verbal substantive and adjective, called the gerund and the gerundive, the former usually with the active, the latter with the passive voice; and two supines, which are the accusative and ablative or dative of a verbal noun. Every single word

in the Latin verb is a complete sentence; the verbal stem being used, not by itself, but in combination with abbreviated forms of pronouns of the first, second, and third persons. The principles on which all verbs are inflected are the same. The differences in detail are due, some to the nature or ending of the stem of the particular verb, some to the unequal preservation of parts of an originally fuller system of inflections. The forms of the present indicative singular active are the simplest, and arise from the union of the stem with personal pronouns. All other parts of the verb contain modifications for tense, mood, number, and voice; those for tense and mood are made between the stem and the personal pronoun, and the inflections for number and voice appended after them. Thus *rêg-êr-ê-m-us* is the first person plural active imperfect subjunctive of a verbal stem meaning "rule." *Rêg* is the stem, *êr* denotes past time, *ê* the mood, *m* the speaker, *us* the action of others with the speaker; and if *-us* be changed into *-ur*, the speaker and others are passive instead of active.—The study of Latin and its monuments, after the beginning of the Gothic age, or about A. D. 500, when it had ceased to be spoken by a distinct people, was at first greatly neglected. When the Germanic races settled in the Romance countries, Latin was spoken only by the clergy and retreated to the convents, where also the remains of the libraries were carried. The monks, however, had little taste for ancient Latin literature; the manuscripts were not copied by them, and they even allowed them to perish, or to be injured by neglect. In the 6th century only Boëthius and Cassiodorus still made a literary use of Latin, and only a few amateurs busied themselves with corrections and revisions of manuscripts, especially of Horace and Virgil. Several elementary text books of Latin grammar were compiled, but the most valuable literary effort of this period is Priscian's summary of Latin philology, which remained the chief authority of the middle ages, and even down to modern times. But men were not wanting, like Fulgentius Planciades, who in their ambition to be considered erudite invented high-sounding phrases, and gave them out as citations from ancient authors. The poetry of this age, by Arator, Venantius, and Corippus, and also the prose of Ennodius, has no other value than as it testified that taste, learning, and skill were rapidly declining. Happily the Benedictine order of monks, which began to flourish during this period, favored the copying of good books, and was thus a means of preserving the ancient authors. The dominion and wars of foreigners, and the settlement of Greeks and Lombards in Italy, and of Franks in Gaul, grew more and more disastrous to the Latin language and literature. Writing materials becoming scarce, ancient works were erased from parchments, which were then used for the purposes of the church. Ignorance of Latin literature gradually produced

a prejudice against it. Monks in Ireland were then the means of preserving the monuments of the literature of Rome, and the converted Anglo-Saxons of England became diligent students of Latin, and translated and copied many manuscripts. During the 7th and 8th centuries lived the eminent scholars Aldhelm of Malmesbury and the Venerable Bede, and after them Winfrid and Alcuin, who labored for Latin culture in France. Charlemagne established schools in which Latin was studied, encouraged the copying of ancient manuscripts by paying largely for them, and founded a library. But though some of the wealthy laity studied Latin for a while, the knowledge of it was soon after that emperor's death again restricted to the clergy. Walafrid Strabus, Servatus Lupus, Scotus Erigena, Hincmar, and Rabanus Maurus were the most eminent ecclesiastical writers of this time. The end of the 9th century also was propitious for Latin. King Alfred, the founder of Oxford university, contributed greatly to the preservation and translation of ancient manuscripts, and caused collections of them to be made. The Normans hindered the development of Latin studies in England, but Germany under the Othos and their successors continued the labors of the British isles. As under Charlemagne and Alfred, several ladies distinguished themselves as careful and accurate copyists of Latin texts; and the nun Roswitha produced several surprisingly excellent poems. Historiography was better represented by Wittekind and Ditmar, and the Lombard Luitprand, and in the middle of the 11th century by Adam of Bremen and Lambert of Asechaffenburg. The convents of Fulda, St. Gall, Reichenau, Hirschau, Paderborn, and Hildesheim were now the chief seats of Latin learning, and Bruder, Bruno, and Gerbert distinguished themselves by their extensive studies and great erudition. Text books and dictionaries, however, were the exclusive property of Italy. The Carthusian and Cistercian monks were very useful during the 12th century, and many highly esteemed codices are written in their hand. Several schools of learning were established in Germany during this period, which, combined with the labors of newly founded orders of monks, as the Dominicans and Franciscans, were also instrumental in preventing the total decay of Latin learning; but the latter were the means of misguiding the taste of German scholars with their so-called monks' Latin. Many a scholastic philosopher was well read in ancient authors. In France there was Abélard, in England John of Salisbury, and in Denmark Saxo Grammaticus, whose Latin is not to be despised. But with the middle of the 13th century came a period of gross ignorance, and Roger Bacon seems to have been the only one who had a really intimate acquaintance with the classics. Italy thus came about this time to occupy the highest place in Latin studies. Milan had already attained some distinction,

and it was now the centre of true philology. Petrarch's admiration for Cicero and Virgil inspired also the better classes of his countrymen, who were suddenly seized with an ardent desire to become acquainted with the literature of Rome. The Latin manuscripts had long remained unread in the monasteries; many of them had been destroyed, and others were mislaid and forgotten. Petrarch, Boccaccio, and Poggio Bracciolini undertook to collect them, and many manuscripts were carried by them from the German convents to Italy, where they were rapidly multiplied, and formed the basis of the Vatican library. Wealthy Italians imitated their example, a great bibliographical activity set in, flourishing factories produced multitudes of copies, and the learned were soon enabled to complete and correct defective texts by careful comparison of manuscripts. These labors of the 14th and the first half of the 15th century were carried on in a somewhat dilettante spirit; but after the year 1465, when the first printing houses were established in Italy and the lovers of learning had the means of communicating to each other the results of their researches, critical discipline soon laid the foundation for a special science. The long line of critics to whom the *editiones principes* are mainly due number, among other eminent scholars, the bishop Andreas Aleriensis, Antonius Campanus, and Leoniceus Omnibonus, the able counsellor of Nicholas Janson, the great master of the typographic art. Criticism was finally carried so far as to lead to very bold interpolations; interpretation, being at this time a new science, gave birth to many exceedingly peculiar explanations; and emendations of texts introduced in some places a wonderfully motley Latin. But in spite of all these drawbacks, men like Hermolaus Barbarus, Calderinus, Britannicus, Marsus, Beroaldus I., Baptista Pius, and Budæus, the first philologist of France, did much valuable work in the furtherance of Latin studies. The enthusiasm of the Italians for the culture of antiquity was completely chilled before the end of the 16th century. The Roman Catholic church put a check on classical studies. The culture of that age was worldly and unwholesome, and a reaction was needed equally for the clergy and the laity. About the beginning of the 16th century France and Germany had cultivated the Latin authors on their own soil. Doletus, Turnebus, Morel, and the Stephenses produced typographically and linguistically excellent editions of texts. With Dorat and Lambin at their head, the French raised the methods of interpretation to a scientific standing, and men like Peiresc largely increased the treasure of ancient manuscripts by searches in private and public libraries, and heightened their value by learned emendations and corrections. The most eminent philologist of this period was Scaliger, to whose critical insight and comprehensive knowledge of the whole field of Latin literature are due many restora-

tions of corrupted texts. He found a worthy collaborator in Casaubon, whose translations and editions are executed with masterly scholarship and care. During the 17th century the number of truly learned philologists decreased in France. Petavius was one of the most eminent. Diplomacy abandoned the use of Latin and substituted French. The practical and fashionable interest being thus on the wane, even scholars acquired little more than a sort of amateur mastery of Latin classics. This is rendered evident especially by the unskilful manner in which the Delphin edition of Latin classics was continued after the death of Huet, its originator. Germany was not as forward in Latin philology as France during the 15th, 16th, and 17th centuries. The first endeavors were tainted too much with the spirit of scholasticism to be of lasting value. Dalberg, Pirkheimer, and Peutingger labored to diffuse the knowledge of Latin, and caused the publication of several texts. But a more permanent influence was exercised by Hegius, Wimpeling, Bebel, and Locher, whose chief attention was directed to grammatical and rhetorical instruction. Reuchlin's labors were the most effective. He brought Latin plays of his own composition, represented by students of Heidelberg, before German audiences, besides translating several Greek authors into Latin. He was instrumental also in drawing popular interest to classical studies through the disputations which were carried on against him by the clergy on account of his leaning toward Roman antiquities. Hutten and Von dem Busche, who were also in the midst of these discussions, were instrumental in promoting classical tastes. The first grammars and other elementary works printed in Germany were not equal, either in learning or in typographical execution, to similar works issued from the Italian press, and it was difficult to find pupils who cared to learn the classic Latin instead of that of the scholastic institutions. The works of the fathers of the church, and several books on history, received more care on the part of the editors and printers. Melanchthon was of great importance as a Latin grammarian and teacher. He was at the head of the Philippici, which school numbered Neander, Fabricius, and Wolf as disciples. The thirty years' war uprooted the seed so carefully sown. The old Latin barbarisms sprang up again, and hardly before the middle of the 18th century were serious attempts made at arresting the progress of the decay of the Latin language as it appeared in print and was uttered in chairs and chancels. The Netherlands in the mean time afforded the safest asylum for Latin studies. While in other countries a certain dilettantism was observable in many productions of the 15th, 16th, and 17th centuries, Holland introduced a method into Latin philology, and gave it a scientific basis on which it continued till modern times. Erasmus wrote excellent Latin, without falling

into the mannerism of the Ciceronians. In the latter half of the 16th century the labors of Justus Lipsius, and the influence exercised by the newly founded university of Leyden, were aided by the excellent work of great typographers. Scaliger also went to Holland, and he and Grotius, Vossius, the family Heinsius, and Gronovius succeeded in laying before the world the best editions which had appeared. Grævius, Burmann, Perizonius, Drakenborch, Oudendorp, and Ducker, whose researches reach to the latter half of the 18th century, were the master critics of their age, and gave their country the foremost position in Latin philology. England produced a man who extricated the Latin studies from the errors of treatment into which the scholars of other countries had fallen. Richard Bentley was the father of the science of verbal criticism. His Horace was a masterpiece of erudition and critical penetration; it laid down a method of philological treatment not thought of before. Markland's skeptical and plodding criticism followed the same vein. Germany soon recovered from the consequences of the reformation and the thirty years' war, and combining the best of the efforts of England and Holland, she stood in the middle of the 18th century on a level with them. Ernesti put a check to the tendency toward hiding the value of the authors commented upon behind accumulations of trifling learning and personal opinions. Heyne searched for the sources of texts and various readings, and was also the means of clearing away much rubbish. His edition of Virgil was deservedly a model of philological work for the next decades. Then came F. A. Wolf, whose aesthetic spirit and delicate penetration laid the foundation for a more elevated treatment of the Latin authors. At the end of the last century there was almost a jealous competition among scholars in publishing so-called critical editions, and a large quantity of previously unused material was put into circulation. The critical apparatus of ancient manuscripts and early editions thus became more trustworthy and complete. The traditional errors began to disappear, and Madvig's Cicero and Lachmann's editions of several poets were excellent attempts at reaching authentic texts. The labors of the present century have resulted in an almost total reconstruction of the works of the most favorite Latin authors. The rise of historical and juristic studies, with Niebuhr in the van, furthered the elucidation of many obscure and neglected passages, greatly facilitating the understanding of ancient Latin works. The Germans now hold indisputably the foremost place in Latin studies, and their labors form the basis of most of the books on Latin published in other countries. The most eminent German scholars, with the special fields in which their works are now the chief authorities, are: on the relation which Latin holds to Greek, Ross; on the history of the Latin language while a living

tongue, Hefster; on grammar, Schneider, G. F. Grotefend, Zumpt, Ramshorn, Otto Schulz, Reuscher, F. A. Grotefend, G. T. A. Krüger, Reising, Mühlmann, Anthon Schmidt, Kritz, Berger, Engelmann, and Fr. Bauer; on the older Latin, to the end of the republic, Ritsch, Corssen, Bücheler, and Lübbeck; on pronunciation, Kopp, Geppert, and Corssen; on vowels, Dietrich and Fröhde; on accent, Langen, Weil, and Benlōw; on the history of the alphabet, Ritschl; on orthography, Ritsch, Mommsen, Fleckeisen, and Brambach; on diminutives, Gustav Müller; on proper names, Mommsen; on composition, Uhdolph; on declension, Bücheler; on pronouns, Osann and Särgert; on conjugations, Nölting, Curtius, Pauli, Lübbert, Weissenborn, Lange, and Sander; on prepositions, Schwarz; on conjunctions, Wisowa; on syntax, G. T. A. Krüger, Hermann Schmidt, K. O. Müller, Holtze, and Scheuerlein. General lexicons have been compiled by Freund, Georges, Mühlmann, and Klotz; etymological lexicons by Schwenck and Georges; special lexicons—for the poets by Bach, Stern, and Lorey, for the sources of jurisprudence by Merkel, for the historians by Dräger, and for Tacitus by Dräger, Zernial, and Bötticher. The *lingua rustica* or vulgar Latin, specially or in its relation to the Romance tongues, has been treated by Schweitzer, Berblinger, and Böhmmer; its vocalism by Schuchard; the Latin of the middle ages by Diefenbach, Brinckmeier, and Hildebrand. Recent English writers on Latin grammar and lexicography, including elementary school books, are Ainsworth, Church, Donaldson, J. C. Evans, T. H. Edwards, T. W. C. Edwards, Fowle, Frost, Gepp, Haigh, Hayman, Hooper, Howard, Kemp, Key, Kirk, Kavanagh, Kennedy, Leary, Lowe, Macgowan, Mason, Millington, Melvin, Mayor, Newman, Oxenham, Perkins, Potts, Riddle, Robertson, Robson, Roly, Rust, Roberts, Stapylton, W. Smith, R. P. Smith, Sargent, Stretton, T. W. Thompson, J. T. White, and Wilkins.—

LITERATURE. The history of Latin literature may be divided into several well defined periods. The earliest period, until the appearance of the poems of Livius Andronicus, about 240 B. C., is void of monuments of literature proper, and may be designated as the period of the beginnings of Latin literature. The second period reaches to the death of the emperor Augustus (A. D. 14). This period may be subdivided into the age of archaisms, or of natural or artless productions; the Ciceronian age, or that of artistic prose; and the Augustan age, or that of artistic poetry. The last two divisions are generally comprised in one, and distinguished as the golden age. The third period extends to the death of the emperor Marcus Aurelius (180); but from the time of Hadrian (117-138) literature was characterized by so great a decline of taste as almost to require a separate treatment. The fourth period is one of literary anarchy. Ciceronian Latin ceases to be the living model of the lit-

erary language, and the plebeian Latin gains the ascendant. The period closes with the beginning of the Gothic age, or the time of Boethius and Cassiodorus, about the year 500. Latin literature, if understood to embrace all works written in the Latin language, would reach to the present day, as men of science in Europe still occasionally write their books, especially when philological, in that ancient tongue. But the subject is here confined to the times of the growth and decay of Latin, when the language of its literature was represented by the speech of a people. Thereafter the task of the historian of Latin literature consists in following out the history of its study, and of the means whereby its knowledge has descended to our own day. This has been merged, in the present article, with the preceding account of the history of the Latin language.—*The First Period, or the Beginnings of Latin Literature.* Though it is to be supposed that Latin poetry, like that of other nations, began in the lyrical form, or, as Mommsen says, sprang out of those primitive festal rejoicings in which dance, music, and song were still inseparably blended, no remains have been preserved of the germs of the Roman epos and drama. The oldest monuments of the literature with which we are acquainted are religious chants and political documents. Among these the Salian songs are probably of the highest antiquity. They were religious litanies sung and danced by the Salii (leapers) and other priesthoods at public processions, sacrifices, marriages, and funerals. One of them, still extant, is a dance chant of the Arval brethren in honor of Mars, revealing a very primitive form of the language. Possibly also a collection of ordinances, spoken of by ancient writers as the *Leges regia* or *Jus Papirianum*, was composed at this time. It is reported that in the age of Numa was written a sort of philosophy of religion, known as *Libri Numæ Pompiliæ*; but the senate ordered the books to be burned, as heretical, before any one gained sight of them. Numerous conjectures in regard to their nature have been entertained in ancient and modern times; but it seems hardly possible that Latin culture was sufficiently advanced to produce a work of such size and spirit. The *Annales Maximæ*, named by Quintilian as the beginning of Latin prose, the clan registers, the books of oracles, and the Alban and Roman calendars, are also of great antiquity. But none of them equals in value, as an index to the state of civilization at that time, the law of the twelve tables, which is exclusively the production of Roman intelligence, and dates from about 450 B. C. Appius Claudius Cæcus, who became censor in 312, was often praised by later writers for his style and learning as a writer on matters of jurisprudence; but not one of his works has been preserved. The four epitaphs of the Scipios, one found in 1616 and the others in 1780, belonging to this period, are written in verses of Saturnian metre, and serve at best as samples

of the prevailing official style.—*The Second Period.* This comprises within two centuries and a half the entire literature of the republic, which, though very mediocre in the beginning, ends with a considerable development of poetry and prose. Greek works were then the raw material of learning and literature, and served as a foundation for the independent thoughts of the Roman people. In the archaic division of this period, the main efforts were concentrated on political labors, and the beginnings of literary grace were made. Livius Andronicus was the first who transplanted Greek literature to Rome, by causing the representation of a drama, and translating the *Odyssey*, which formed the first school book of the Latin youth. His productions exhibit neither ease nor beauty; but his successor Nævius, about 235, attained greater fluency and a more masculine rhythm, and deserves to be classed as a genuine poet. The events of the second Punic war created a desire for historical writings, which the contemporary Fabius Pictor and Cincius Alimentus attempted to satisfy, but without exercising any critical judgment on the Greek sources from which they borrowed their material, and writing chiefly in Greek. The decrees of the senate, as the *Senatus Consultum de Bacchanalibus*, dating from 186, afford a better opportunity for estimating the progress which so far had been made in Latin style. The sentences are loose, the orthography archaic, and the general form not very smooth. The best representative of the culture of this time undoubtedly was the elder Cato, a master of Latin prose in the beginning of the 2d century B. C. He was the first who wrote his mother tongue with fluency, remoulded the archaisms, and cast over them the freshness of his own spirit. His *Origines*, a work of seven books, giving the ethnography and history of ancient Italy, and replete with all manner of researches, incidents of war, and memoirs, was a valuable legacy to his countrymen. His opposition to Greek culture, though he himself possessed most varied learning, exercised a salutary influence on the growth of an independent literature. Epicurean philosophers were expelled, Greek rhetoric condemned, and permanent theatres forbidden. Only the grammatical discourses of Crates, the Pergamene ambassador, were listened to without prejudice. But the wealthy class soon turned again to Greek culture and to foreign literatures as an aristocratic adornment. With the extension of the Roman power came an influx of the treasures of Greece, Macedonia, Asia, and Libya, making the Romans depreciate the meagre products of their own civilization, but not without creating a desire for similar culture. In Cato's time appeared the father of Latin poetry, Quintus Ennius, who died in 169. He was a man of wonderful versatility, and his genius was exceedingly productive; but the chief value of his poetry was, that he abandoned the Saturnian metre, and introduced

the rhythms developed by the Greeks. In his adaptation of the Latin language to the Greek style he was naturally guilty of stretching words to uses not always admissible, but even this error was of profit to the Romans, as it showed them the great flexibility of their tongue. Cæcilius Statius (died in 168) and Mæcius Plautus profited by his lessons; but not being brought up like Ennius in the circles of Roman aristocracy, they introduced into their imitations of Grecian comedies the language, thoughts, and manners of the plebeians; their comedies, consequently, were more pleasant to look at when performed than to read. Pacuvius also was a successor of Ennius. His tragedies were more than mere translations from the Greek, and though he was no innovator in the poetic art, he was quite free and original in the treatment of foreign materials. In 166 was represented the first drama of Terence, whose imitations of Menander were rather exact and measured. His dialogues manifested good taste, and his language was perfectly exemplary and very spirited. Novius and Pomponius, writers of a later generation, were more popular poets, as they understood how imperceptibly to turn the gravity of the Romans to purposes of wit and humor. Lælius, Sulpicius Gallus, and Ælius Tubero were probably the best educated among the cultivated classes of this time; and Lucilius, their friend (about 120), created with delicate literary invention a new form of popular poetry, which deservedly grew into general favor. He was well versed in the secrets and failings of Roman society, and he used his poetic art to freely criticise them, and the ways of native law and science. While his satires had a beneficial effect upon the customs and learning of the age, it was Attius (or Accius) whose elevated pathos endowed Roman tragedy with the true fervor of poetry. He brought upon the stage the brilliant figures of the history of his country, and inspired his spectators not only with patriotic feelings, but also with a better appreciation of the poetic art. It is noticeable that so far there was neither epic nor lyric poetry. The increased moral degradation, the unequally divided property, which constantly threw the senate and the people into violent discussions, and the legal processes of enormous magnitude, called the best talents to the practice of law and the efforts of eloquence. The principles of philosophy had to serve them as handmaids. But philosophy had come to a halt even among the Greeks, and consequently was but little cultivated by the Romans. There were Epicureans and Stoics, and the latter exercised great influence on Roman jurisprudence. Empiricists of high standing were Mucius Scævola (about 95), the creator of the *ius pontificium*, and Manilius and Junius Brutus (about 134), practitioners of law. Yet public eloquence was at this time the most potent lever of literary efforts. Sulpicius Galba (149) was eminently successful, even in bad cases, through insinuating arti-

fices of pathos; and Papirius Carbo (about 105) rendered himself famous through the momentary sway of his rhetoric. But these natural-born orators were totally eclipsed by the culture, spirit, and passionate fire of Caius Gracchus. His elder brother Tiberius left no literary monument to bear witness to the greatness of his talents; but the two sons of Cornelia shared equally the admiration of their nation for legal learning and oratory. The wild partisan quarrels and the tempests of the civil war filled the political profession with men untrained by study. Scribonius Curio, Marcus Antonius the orator, and Licinius Crassus depended for their fame rather on their personal bearing and the boldness of their discourses, than on such elegance of style and artistic elaboration as would render them of value to literature. Historical works improved, though not enough to leave to posterity either a readable book or a model of historical criticism. The *Annales Maximæ*, a dry register of the most memorable events of the republic, had ceased to be kept. Zealous statesmen wrote instead the memoirs of their times, and each gave them a personal coloring, but none possessed the requisites for making a good narrative or for giving details in proportion to their interest and importance. When the remembrance of their authors had passed away, the biographical memoirs of Æmilius Scaurus (about 115), Rutilius Rufus (about 105), Lutatius Catulus (about 105), Cornelius Sulla (about 89), and generally of the closing years of the 2d century B. C., were also forgotten. Some historians, as Albinus Scipio, Acellus, and later also Lucullus, composed their works in Greek, though they could hardly expect to find readers in Greece. The attempts at writing complete histories of Rome ended in the accumulation of bulky materials, but they were failures in methodical treatment. Fannius and Cassius Hemina (about 134) wrote, though with much naïveté of conception and great meagreness, about some episodes in the history of their country; and only Sempronius Asellio shows that he had at least a perception of what is required in a history. Cælius Antipater, Claudius Quadrigarius, and Cornelius Sisenna (about 89) mark in succession the slow progress toward the perfection of historiography; for even the last and best of the three overloads his narrative with useless details, and impedes the flow of language with rhetorical flections and archaic words, both tasteless and wearisome. But the appearance of professional grammarians and rhetoricians was not without some influence on the development of the Latin language. The rhetoricians still labored under the difficulty of having no national standard literature to which they could refer for models. The study of their linguistic material led to the adoption of certain rules in regard to what should be avoided in and what should be attained by literary compositions. Ælius Stilo (about 100), Servius Claudius, Aurelius

Opilius, and Valerius Cato (about 89) were the first to distinguish themselves in grammatical and philological studies. The tragedian Attius, a fruitful poet, and the author of the *Didascalía*, a history of dramatic poetry, raised his art to a higher standing, and taught the Romans wherein it should really consist. Porcius Licinius wrote versified biographies of the poets, and furnishes thereby some evidence of an increased interest in the fortunes of literature. The Romans then began to love literary studies, and they very soon passed a just and practical judgment upon its aims and tendency. They saw the necessity of following the examples of the Greeks and heeding their lessons, and the richness of the materials which they imported raised their desire for a literature of at least equal merit. Their endeavors were crowned with results which have not unjustly given the name of the golden age to the next period. This golden or Ciceronian age was not productive of equally excellent works of poetry and prose. Poetry had so far found root only in the drama, and the sober moods of the Romans during the last stages of the republic were naturally unproductive of attempts at high poetic flights. Even the drama was losing spirit, and that it even continued to exist is due principally to the art of the actors Clodius Æsopus and Roscius. Epic poetry was composed by Hostius, Furius, and Varro Atacinus; but these versified incidents of Roman warfare met probably with less favor than the translations of the Greek epos. Varro Atacinus had some merit as a translator, Varro as a satirist, and Hortensius and Licinius Calvus as miscellaneous poets. Lævius and Helvius Cinna, burdening their poetry with learned conceits which rendered their meaning obscure, did not enjoy equal popularity. The only truly poetic mind was Lucretius Carus; his compositions are faithful reflections of the sentiment then nurtured in Roman hearts, skepticism without consolation. Rome was never more learned and erudite than at this time. Catullus, called *doctus* from his Greek learning, wrote an impassioned religious poem, the *Atys*, and one legendary heroic poem, but is best known for his exquisite lyrics, elegies, and epigrams. The universally informed Terentius Varro Reatinus, who was probably the greatest savant of antiquity, not unworthily received from his own nation the title of the "most learned of Romans." His writings are scattered over all departments of human knowledge, and he gathered the facts of early Roman history into a body of antiquities, which he never wearied of enlarging by essays on special subjects. The Romans owe to him the first foundation of a general scientific culture, and it is to be regretted that his discourses on the religions, morals, and institutions of their better days came too late to put a check to the decadence of their social life. Nigidius Figulus (about 60) was a solitary laborer in the fields of speculation and grammar, and his works are

hardly mentioned except for the unfruitful theories they contain. Pomponius Atticus (about 60), who kept a sort of factory for the multiplication of manuscripts, was probably well versed in the literature of his day, and capable of rendering a just verdict on its merits; but none of his various historical and critical writings have come down to us. Historiography and eloquence were totally remodelled in respect to plan, method, and form, and gained the highest excellence in the prose literature of this age. It is not known how great was the merit of the historical works and chronicles of Luceius (about 60), Cornelius Nepos (about 54), Atticus, and Asinius Pollio (about 40). The fragments of Nepos show only that they were written in a simple style and a sober tone, indicative of good taste. This style was carried to perfection in Cæsar's Commentaries, which are among the proudest monuments of Latin literature. But the most clear-sighted and artistic Roman historian was Sallust (about 45), whose works were largely read and closely imitated. Eloquence was greatly needed in the days of the fall of the republic, and the antagonism between the party leaders of varied culture was productive of florid rhetorical displays. Quintus Hortensius was early renowned for the Asiatic richness of his speeches, which were also models of logical arrangement. He had many imitators and rivals, and it is to be supposed that men like Cælius Rufus and Licinius Calvus exhibited equal powers of oratory, the one in ebullitions and the other in concealments of passion. Cæsar's speeches were always simple; those of Asinius Pollio equally so, but replete with archaic expressions, which were probably to be found also in the discourses of Servius Sulpicius and Marcus Calpidius. The master in this sphere of literary effort was undoubtedly Cicero, though he certainly did not occupy as high a rank in his own day as the grammarians and his disciples have since assigned to him. To many contemporaries he did not seem sufficiently brief and concrete; and though he found many imitators, there were others who considered his style too florid. Cicero made use of a large amount of well grounded information, drawn from Greek literature and native philosophy and history, and he enriched the Latin vocabulary, which hardly went beyond the most immediate needs of business and law, not only with new words, but also with new means of employing old ones. Upon the simple and untutored language was gradually reared the so-called classical Latinity, which may in a measure be regarded as Cicero's own work. Latin literature after his time was of another cast.—The Augustan age, beginning with the year after the battle of Actium (31 B. C.), and 13 years after the death of Cicero, presents indeed a great contrast. The wild days of republican anarchy had confused the morals of the nation, and a wonderful realism set in, of which the poets came to be

the most ardent exponents. Augustus, though himself hardly a literary person, did everything in his power to further literary pursuits. He rewarded prominent poets and learned men, and encouraged them by his presence at their readings and discourses. Without Augustus, Virgil's *Æneid* would probably not have been completed; Ovid's most brilliant poems were composed under the favor of his court; and even Horace, though shy of the emperor's luxurious train, could not withhold his praise of the endeavors of Augustus to raise the standard and to widen the fields of Roman literature. Libraries were organized, and public newspapers, or wall posters, were edited by the state. The wealthier classes became in their turn protectors of literary men, and constituted an audience which an author felt stimulated to address. Mæcenas, without himself coveting literary fame, was surrounded by a multitude of poets whom his clear judgment and excellent taste had drawn out of obscurity, and to whom his purse was always open. Asinius Pollio also was a warm friend of the great minds of his time, and they enjoyed the advantage of having in him an excellent judge of literary worth. Jurisprudence, grammar, and rhetoric now received more careful cultivation. The lawyers Alfenus Varus, Antistius Labeo, Trebastius Testa, and Ateius Capito distinguished themselves by numerous genuinely scientific works. The grammarians Ateius, Valgius Rufus, Julius Hyginus, and Verrius Flaccus came to be looked upon as authorities by the new generation of authors, especially the poets. The rhetoricians also began to exercise a healthy influence, principally on the style and logical sequence of compositions. The most celebrated among them were Porcius Latro, Albuçius Silus, Arellius Fuscus, and even the arrogant Greek Cestius Pius. But the glory of the Augustan age was its poetry. The poets were not such great flatterers of Augustus as is often maintained. Virgil wove into his epos the interests of the gens Julia, but otherwise the school of poetry of this age was neither officious nor untrue. There was no need of courting solely imperial favor, as the poets had warm friends among the better classes of the Roman people. They were assiduous students of Greek art, and their poems naturally abound with Græcisms and imitations, though to a less extent than is usually asserted. Many forms of Alexandrine origin were introduced, and others of common speech were reshaped according to the requirements of art. The mastery of form, correct in grammar and rhythmic flexion, rich in language, and perfect in metre, deserves the highest admiration; and its severe elaboration did not break its easy grace. This age produced every class of poetry, from the epos to the poetic epistle and the didactic poem, in equal perfection. The polished elegies of Tibullus celebrate his loves and his short martial experience in Gaul. Propertius abounded in

rich imageries; Virgil's classic phraseology remained the standard for five centuries; Ovid excelled in happy narratives; and Horace was a model of purity in language. The lesser poets, as Rabirius, Cornelius Severus, Domitius Marsus, and Æmilius Macer, though not so great as those whom the Romans at once perceived to be unrivalled masters, yet produced many poems creditable to the high company of literary artists in whose time they lived. While poetry was at high tide the noblest and most valuable prose was at ebb. Historians either modelled their accounts after the wishes of princes, or sought refuge among the events of the past. They felt that the times were against them, and their labors show that they were aware they had lost their freedom. A few, removed from political life, made good use of the libraries which were then accumulating, and formed a sort of encyclopædic surveys of the historical materials. Livy was the first to compose a general picture of the entire history of Rome, which, though written without political insight, was universally recognized as a classical production. Trogus Pompeius wrote the first Latin book on ethnography, and he also wrote excellent prose. But Labienus and Asinius Pollio, who undertook to treat the occurrences of their own day in an independent, critical spirit, were reduced to silence; and other writers of contemporary history were insignificant enough to be speedily assigned to oblivion without any special governmental decree. Nevertheless, Rome began the next period with such abundant culture that it was justifiable to expect a realization of the highest literary ideals. This, however, did not come to pass.—*Third Period.* The third period, from A. D. 14 to 180, which has long borne the title of the silver Latinity, and to which many of the high talents of imperial Rome belong, is a great disappointment. Brutal despotism, beginning with Tiberius, almost uninterruptedly and ever increasingly burdened the Roman mind until the death of Domitian. Culture was not driven out of existence, yet it was not allowed to stimulate the masses. But though the literature of the 1st century no longer spoke to a free people, it had inherited from the preceding period sufficient strength to maintain for a while at least an attitude of ease. Poetry suffered the most. Ovid, Horace, and Virgil were read and studied with avidity, but no one produced anything worthy of comparison with the poems of any of these three. During the 23 years of the reign of Tiberius, besides Manilius, Phædrus, the writer of fables, is the sole poet. Rhetoric also slowly sank from the height it had attained in the Augustan period. Voltienus Montanus, Scaurus, and Romanus Hispanus were the only rhetoricians who still evinced some degree of excellence. Tiberius himself had received a good rhetorical training, which he exhibited both orally and in writing. The unfortunate Germanicus composed several works in verse,

among them a version of Aratus's astronomy. The orator Asinius Gallus wrote a comparison of his father Pollio and Cicero. Velleius Paterculus (about A. D. 25) wrote an abridgment of Roman history in good style. Valerius Maximus made a collection of anecdotes for rhetorical purposes, most of which are dull, and all of which are put together in a very uncritical manner. A prolific writer was Cornelius Celsus, the author of a sort of encyclopædia on eloquence, jurisprudence, farming, medicine, military art, and philosophy. The principal grammarians were Julius Modestus, Pomponius Marcellus, and Remmius Palæmon; and probably also Nisus belongs to this reign. Botany was represented by Cæpio, Antonius Castor, and Apicius. The latter wrote also on cookery, and Julius Atticus and Julius Græcinus on the culture of the vine. Pomponius Secundus seems to have written several tragedies, but his works were published after the time of Tiberius. During the reigns of Caligula, Claudius, and Nero, impartial historical compositions were in disfavor. The chief author of this age was Annaeus Seneca. He wrote a faithful picture of his period, but in some portions he was more brilliant than accurate. His popular philosophical writings charmed by their fulness and fineness of observation, abundance of knowledge, elevation of thought, and dazzling style. The reader feels, however, that Seneca is not always sincere, and that his main endeavor is to please. Among his prose works is one on morals, in letters addressed to Lucilius. He left ten tragedies, all of which, though of a severe metrical treatment, are scarcely endurable for the exaggerated abundance of words and rhetorical figures. The poets Gætulicus and Servilius Nonianus wrote on subjects of contemporary history, but their works, like those of Domitius Corbulo, who described his personal adventures in Asia, and of Cornelius Bocchus, who wrote a work on chronography, are merely known from quotations. Curtius Rufus wrote an extensive history of Alexander the Great, in part extant, in a style resembling that of Seneca. Columella of Gades is known to us by his 12 books *De Re Rustica*, written in an enthusiastic style, but without artistic arrangement of materials. Asconius was a devoted student of Cicero, Sallust, and Virgil, and some of his historical commentaries, especially those on Cicero, are esteemed as of high value. The three books on chronography by Pomponius Mela give the earliest account of the ancient world which we possess. Works on philosophy were for the most part written in Greek; among them those by Sextius, Cornutus, Musonius, Rufus, and Epictetus. Of the philosophers who wrote in Latin may be mentioned Celsus, Papius Fabianus, Plautus, and especially Seneca. The Stoic doctrine was the one generally embraced, but some of its adherents diluted it into a mere system of practical wisdom, while others exaggerated it by additions from Pythagoreanism and Cynicism. Va-

lerius Probus is the most eminent grammarian of this time. The epic panegyric on the consul Piso was probably written in the reign of Claudius by an unknown author of great talents, who had an elegant flow of language, and a vast acquaintance with the literature of the Augustan age. With the bombast characteristic of this period, Persius Flaccus wrote (besides other compositions not extant) six satires, mostly versified lectures on Stoicism. A fertile writer in prose and verse was Annæus Lucanus (Lucan). His *Pharsalia*, an unfinished epic on the civil war between Pompey and Cæsar, though rather artificially pathetic, shows him to have been a man of talent, and possessed of a generous heart. Other writers of verse at this time were Cæsius Bassus, Vagellius, Curtius Montanus, and Serranus. It is believed that during Nero's reign appeared the character novel ascribed to Petronius Arbitr; it is a work of art in its way, full of humor and knowledge of human nature, and is important, though now only a heap of fragments, as representing the manners and language especially of the plebeians in that age. Here belong also a didactic poem entitled *Ætina*, probably by Lucilius Junior; a metrical version of the Iliad for school purposes; and the poems contained in the Codex Vossianus 86. Under Vespasian and Titus literature was benefited by the blessings of peace, but under Domitian it suffered greatly by his vanity and cruelty. Under the former flourished Pliny the Elder, who, in spite of his extensive official occupations, found time for great literary activity in the departments of history, grammar, rhetoric, tactics, and natural science. Of his works, only a kind of cyclopaedia of natural science, compiled frequently in haste and without adequate knowledge for the exercise of criticism, has come down to us; it is a monument of the serious, studious, and patriotic mind of the author. Cluvius Rufus produced a historical work embracing the time of Nero, and Vipstanus Messala also wrote on events which he had witnessed. Their histories, and that of Fabius Rusticus, which also seems to belong to the time of Vespasian, have at least the merit of aiming to present facts. Orators of this age were Curiatius Maternus, Julius Gabinianus, Aper, and Julius Secundus; and the most influential jurists were Cælius Sabinus, Pegasus, Urseius Ferox, and Juventius Celsus the elder. Among the poets of this time is Valerius Flaccus, whose 10 books of *Argonautica* show a diction rhetorical and full, but not lucid and symmetrical. The tragedies of Curiatius Maternus and the epics of Saleius Bassus are lost. The reign of Domitian was productive of a vast number of dilettanti whose verses only proved their insignificance and harmlessness. Domitian's hand lay heavily on all intellectual life, and in order not to endanger their liberty and honor men like Juvenal, Tacitus, and Pliny the Younger kept silent. Silius Italicus (25-101) wrote 17 books of *Pu-*

*nica*, taking the subject from Livy, and imitating Homer and Virgil. He constantly assigns mythological motives, and is monotonously strict in the technical treatment of his verse. The largest work of Papinius Statius was the *Thebais* in 12 books, which, as well as his uncompleted *Achilleis*, is exceedingly dull, though his *Silva*, five books of poems, show that he possessed good talents. Valerius Martialis left 15 books of epigrams. Martial's preference is obscenity, but he equals Ovid in ease and elegance of poetical form. Among the numerous other poets may be mentioned Arruntius Stella, Turnus, Verginius Rufus, Vestricius Spurinna, and Calenus's wife Sulpicia, who all wrote erotic verses. The most prominent prose writer of this age is Fabius Quintilianus. Quintilian composed first a work on the causes of the decay of eloquence, and then a large work (extant) on the complete training of an orator (*Institutio Oratoria*), of which the 10th book, containing a list of the literature useful for rhetorical studies, is of great value. He is never tired of praising Cicero, whose style he attempts to imitate. Besides Tullius as a writer on rhetoric, and Princeps as a rhetorician, appear the names of Aquilius Regulus, Bæbius Massa, Mettius Carus, and Palfurius Sura, who were mostly time-servers and informers. Julius Frontinus, an excellent engineer, was the author of a popular work on tactics, and of a work in two books *De Aquis Urbis Romæ*, written in a concise and refined style. Among grammarians were Æmilius Asper (an erudite commentator on Terence, Sallust, and Virgil), Claranus, and Apollinaris. A harmless historical work, which appears to have been a universal history, was composed by Junius Maximus; while Arulenus Rusticus and Herennius Senecio wrote in opposition to the government, and lost their lives. Between 96 and 117, under Nerva and Trajan, literature, though greatly on the decline, gained a large number of writers in all departments. Nerva himself took some interest in poetry, but Trajan promoted the development of literature only indirectly. The most prominent poet of the age of Trajan was Junius Juvenalis, of whom we have 16 satires eloquently and vividly describing the vices of Roman society, but not without monotony, produced by his unvarying conciseness. Among the many who composed verse at this time were Octavius Rufus, Titinius Capito, Passennus Paulus, and Caninus. The most prominent prose writer is Cornelius Tacitus, who as a historian followed the best sources, sifting them with strict criticism, and only indicating his own views, but always writing in a melancholy and bitter tone. His *Dialogus de Oratoribus* shows that he endeavored to imitate Cicero's style at least in his rhetorical works, and the biography of his father-in-law Agricola reminds us of the manner of Sallust. His *Germania*, an ethnographic monograph, is to some degree a mere comparison of the simple ways of the Germans with the cor-

ruption of Rome, and is frequently rather sentimental. His *Historiæ*, being the narrative of the events of the reigns of Galba, Otho, Vitellius, Vespasian, Titus, and Domitian, has not been entirely preserved. His *Annales* is also incomplete. The literary activity of Pliny the Younger consisted chiefly in the writing of letters for publication, extending in a studied variety over a large number of subjects. His style is fluent and egotistic, but graceful and frank. Pompeius Planta and other historians show a great preference for relating recent events. Jurisprudence was represented by Proculianus Neratius, Juventius Celsus, Javolenus Priscus, Varius Lucullus, Arrianus, Vivianus, and others. The principal grammarians were Urbanus, Velius Longus, probably also Flavius Caper, and Hyginus. Balbus wrote on geometry. During the time of Hadrian (117-138) literature suffered somewhat from the preferences of the emperor, whose own productions hardly go beyond dilettantism. The most important literary character now is Suetonius Tranquillus. His *Viri Illustres* and "Lives of the Twelve Emperors" are inaccurate in chronology, though derived from good sources; the style is rhetorical, but monotonous. Annaeus Florus wrote an abridgment of Roman history down to Augustus, which is rhetorical and inaccurate. Justinus, the historical writer, may have lived about this time; other compilers of history were Greeks and wrote in Greek. Among jurists, the most eminent was Salvius Julianus, who was intrusted by Hadrian with collecting the edicts of the prætors in the republican period; others of importance are Aburnus Valens, Pactumeius Clemens, and Pomponius. Among rhetoricians, the majority of whom wrote in Greek, the most noted were Castricius and the learned Spaniard Antonius Julianus. The principal grammarian of this age is Terentius Scaurus, who wrote on Latin grammar and poetry. Philosophical studies were chiefly represented by the Greeks, as by Plutarch and Calvisius Taurus. Cælius Aurelianus, an African author, left two badly written works on medical art. Writers of verse, mostly in iambic dimeter, were Annianus, Ælius Verus, Voconius, and others; but Hadrian's time produced no poet of great note. The time of the Antonines (138-180) closes this period. The excellent reign of Antoninus Pius did not prevent a further decline of Latin literature. The national taste was so low that a man like Fronto could be the highest authority; we have the greater part of his correspondence with Marcus Aurelius, from which he appears equally wanting in genius and taste. Erudition and the affectation of it became the fashion. Greece and the Græcized East furnished the majority of the ablest authors, who all wrote in their native language. Among the professors of archaic scholarship appear the names of Apollinaris of Carthage, Gellius, Pertinax, and Arruntius Celsus. Histor-

ical pursuits were not in great favor; it is possible that Ampelius, the author of a meagre abridgment, and Granius Licinianus belong to this time. Volusius Mæcianus wrote, besides juridical works, a treatise still extant on the divisions of money, weights, and measures. The most famous of the numerous works of Gaius, the *Res Cotidianæ* and the *Institutiones*, are exceedingly graceful, lively, and natural; the latter served as the foundation of Justinian's *Institutiones*. The poetical productions of this age are insignificant, unless the *Per-vigilium Veneris* and the jocular epic called *Vespa* were composed in it. The literature of the reign of Marcus Aurelius (161-180) remained under the influence of Fronto and his pupils Aufidius Victorinus, Servilius Silanus, and Postumius Festus. The 20 books of *Noctes Atticæ* by Aulus Gellius are very important for many departments of literature and for an accurate knowledge of this time. His diction is rather sober, but he seems to have collected his material with much care and industry. The Platonic philosopher and rhetorician Apuleius of Madaura possessed great originality, facility, and vivacity. Cervidius Scævola, the jurist, wrote 40 books of *Digesta*, which have been much used in the Pandects. In the same time Papirius Justus composed a collection of imperial constitutions, and Paturus wrote a work on military affairs.—*The Fourth Period*, 180 to 500. This is the period of the dissolution of the national literature. The emperors had little favor to bestow upon it, and could not prevent its decline. They themselves had to struggle to keep the fragments of the former imperial power together; most of those in the 3d century had little culture, and those of the next centuries still less. During the time from the accession of Commodus to the death of Septimius Severus (180-211) the Christian religion gained ground even among the educated, and was defended by the eloquent Minucius Felix and Tertullian. The former has left us the earliest extant works of Latin Christian literature, in the dialogue *Octavius*. The author had the usual philosophical and æsthetical training of his period, and he imitates ancient models in a fluent and elegant style. Septimius Florus Tertullianus is an author of much independence and genius, endowed with a lively imagination, whose eloquence often oversteps all limits. His works are all somewhat unpolished, intricate, and obscure. The great jurist Æmil-ius Papinianus is distinguished for great lucidity, and the most important of his works, the *Quæstiones* and *Responsa*, were much used in Justinian's collections. Contemporaries of Papinian were the jurists Messius, Callistratus, and Claudius Tryphoninus. In the beginning of the 3d century we have a grammar by Dositheus, but of the writings of the learned Sammonicus Serenus the elder nothing has come down to us. Among jurists of the first half of the 3d century is Ulpianus, probably the

most important, as his works were long held to be high authority, and they contain excellent materials, with pertinent criticisms in a clear style. His contemporary Julius Paulus surpassed him in fertility, but was his inferior both in accuracy and style. Three grammarians of this time enjoy some celebrity, viz., Julius Romanus, Juba, and Censorinus; their treatment was rhetorical. Gargilius Martialis wrote an extensive work on husbandry, from Greek and Roman materials. Marius Maximus wrote at length the biographies of the emperors subsequent to Nerva, but without attention to truth. Herodianus wrote in Greek a history of his time, and Dion Cassius a Roman history from the foundation of the city to the year 229. The grammarian Julius Solinus wrote worthless *Collectanea Rerum Memorabilium*, revised in the 6th century and given out again under the title of *Polyhistor*. The contents of the works of St. Cyprian (Thascius Cæcilius Cyprianus) are partly of an apologetic and partly of a practical and hortatory character; and their diction, though not admirable, at least excels Tertullian's in lucidity and correctness. Many attempted metrical composition. Such were Alfius Avitus, who wrote a history in iambic dimeters; Marianus, the author of *Lupercalia*; Septimius Serenus, who imitated Greek metres; and Sammonicus Serenus, who wrote 1,115 hexameters *De Medicina Præcepta*. Two poems of Commodianus which have come down to us are filled with an ardent Christian zeal, though executed in defiance of metre and prosody. Several emperors of the second half of the 3d century were of Thracian and Illyrian origin, raised to the throne for military valor; and when the organizing genius Diocletian, the son of a peasant in Dalmatia, attained the imperial power, the eastern influences which had penetrated all departments of life were succeeded by northern influences, and both the form and the substance of Latin literature suffered severely. In the time before Diocletian, Nemesianus wrote a didactic poem on the chase, of which the first 425 lines, which have come down to us, attest a great command of words. The history of these years was written by a number of authors, but we hear of them only through the *Scriptores Augustæ Historiæ*, who availed themselves of them. The rhetorician Aquila Romanus left a meagre and hasty little book, *De Figuris Sententiarum et Elocutionis*. Toward the end of this time it seems that Nonius Marcellus composed his extant lexical work *Compendiosa Doctrina per Litteras*, which, in spite of its great want of solid information, criticism, and accuracy, is still invaluable, as it contains numerous quotations from earlier Roman literature. With Diocletian (284-305) came the panegyric orators, who devoted their eloquence to the superhuman virtues and performances of the emperors. Gaul was now the chief home of this art, and Marseilles, Narbonne, Toulouse, Treves, and other cities had rhetoricians of their own,

whose lectures were much favored by the vivacity and linguistic versatility of the nation. Of such speeches we possess some by Maximianus Herculeus and by Eumenius of Autun. The *Scriptores Augustæ Historiæ*, as Ælius Spartianus, Valcatius Gallicanus, and Trebellius Pollio (in several cases it is doubtful to whom the authorship belongs), are all void of talent and ability, though apparently honest; these biographies form our sole historical source. A jurist named Gregorianus made a collection of the constitutions from Hadrian to Diocletian, known as the *Codex Gregorianus*; it survived, however, with the supplement by Hermogenianus, only as far as it was inserted in Justinian's codex. An *Ars Grammatica* was written by Marius Plotius Sacerdos; a metrical manual by Terentianus of Mauritania; and seven books in defence of his conversion to Christianity, but without much comprehension of the purport of the religion, by the rhetorician Arnobius, the teacher in eloquence of the famous Lactantius Firmianus, who surpasses all other Christian writers in the purity and elegance of his diction, and the more important of whose works have happily come down to us. A work of value for historical studies is a fanatical account of the end of all persecutors of the Christian religion, from Nero down to Galerius and Maximinus. A number of metrical compositions which turn on subjects of heathen mythology, such as those by Reposianus, Cæsius Taurinus, and Pentadius, belong also to the time preceding the official victory of Christianity, and the removal of the imperial residence to Constantinople, which imposed a new character on the literature of the 4th century. This is the epoch of the greatest brilliancy in the literature of the Christian religion. Constantine himself wrote memoirs, of which only scanty traces survive. He also was pleased with panegyric speeches, and Eumenius, Nazarius, Marcomannus, and Titianus were the most prominent rhetoricians of his age. Optatianus wrote a nonsensical poem in praise of the emperor, and the Spanish presbyter Juvencus a version of the Old and New Testament history in epic metre. Jurisprudence was exclusively devoted to collecting and epitomizing. Charisius was the author of juridical monographs, and Hermogenianus of the codex bearing his name and of *Epitome Juris*. A collection of legal documents, generally entitled *Fragmenta Vaticana*, was also probably made in the time of Constantine. Grammatical studies were now prosecuted without pretence to historical investigation and scholarship; the work of Cominianus seems to have been of this kind. Firmicus Maternus of Sicily wrote *Matheseos Libri VIII.*, a complete system of astrology; and a Christian writer of the same name produced a work entitled *De Erroribus Profanarum Religionum*, in which he demands the eradication of paganism. Philosophy was studied in Athens in the theosophic and theurgic manner

of the Neoplatonists, and this tendency gained ground also in Rome. About the middle of the 4th century lived Donatus, the author of several valuable works on grammar, and of commentaries on Terence and Virgil. Palladius wrote 14 books on husbandry, but without making any claim to great erudition. The historical literature of this time consists in the short abridgments of Aurelius Victor, Eutropius, and Sextus Rufus. Eloquence was practised by many, among them by Gennadius, Alcimus, and Delphidius; but the only extant Latin speech of this period is one by Claudius Mamertinus, which gives a faithful portrait of Julian's character as a prince. Hilarius (Hilary), bishop of Poitiers, was a fertile writer on theology; less prolific were the Sardinian bishop Lucifer and the bishops Phœbadius and Potamius. Rufius Testus Avienus wrote poems, chiefly didactic, on historical subjects, and manifests always great purity of form and thought. The poetical compositions of the rhetorician Magnus Ausonius have little value as poems, but are interesting for their faithful representation of the persons and affairs of his age. The requirements of Christian worship occasioned the composition of hymns, and those of Damasus (died in 384) are among the earliest which have come down to us. To this time may be assigned also the earliest Latin translation of the Bible (*Itala*), and the translation of Pelagius is not much later. From the reign of Theodosius I. polytheism became gradually extinct, and only a few circles maintained their interest in the old literature. Symmachus and Ammianus were in fact the last representatives of polytheism in literature. The fluency and elegance of Symmachus in literary composition were acknowledged even by his adversaries. Other rhetoricians of his time were Pacatus, Palladius, Saggius, and Eugenius, whom Arbogast raised to the imperial throne. Ammianus Marcellinus of Antioch wrote a continuation of Tacitus in 31 books; he honestly endeavored to tell the truth in regard to his own time, but his diction is very difficult to understand and wearisome. Philosophy was chiefly studied by men like Vettius Prætextatus, who hoped to find in it a weapon against the Christian religion. The number and importance of the Christian writers were of course daily increasing. Above all stands Ambrosius, bishop of Milan, among whose writings the letters and the funeral sermons on Valentinian and Theodosius are important for history. His hymns, which kept more closely to classical form than those of Damasus, became very famous. St. Jerome (Hieronymus of Stridon) was the most learned Christian writer; he interpreted and translated the books of the Bible, and wrote an enlarged version of the chronicles of Eusebius and the *Viri Illustres*, a history of Christian literature. Prudentius wrote poems on Christian subjects, in various metres, and not long after him Sulpicius Severus and Orosius treated history from the Christian point of view.

Medical literature was reduced to translations of Greek works, or consisted in valueless enlargements of earlier Latin works. Claudian (Claudius Claudianus) was the most important heathen author at the close of the 4th and the beginning of the 5th century. Though a native of Alexandria, he wrote principally in Latin, and imitated the diction and metres of the poets of the classical age with perfect success; his mastery in description appears very brilliantly in his "Rape of Proserpine." St. Augustine the African (Aurelius Augustinus, 354-430) is the most conspicuous intellect of this time; his diction is somewhat too ornate and verbose, but not rarely also logical and precise. A short account of universal history was written by Sulpicius Severus, whose contemporary Julius Hilario wrote a treatise on the duration of the world. Early in the 5th century lived also the Briton Pelagius, the well known founder of Pelagianism, his young friend Cælestius, the translator Anianus, and, among other Christian writers, Antiochius, Severianus, Bacharius, Sabbatius, Helvidius, and Innocentius. Macrobius wrote a commentary on Cicero's dream of Scipio, and seven books of *Saturnalia*; the rhetorician Endeledichius, a pleasant idyl on a cattle plague; Audax, some tyro-like verses on Augustine; and Lucillus, some satires which are lost. At the same time, perhaps, Arianus composed 42 Æsopian fables in elegiac metre, which were used as a school book, and frequently copied, augmented, paraphrased, and imitated. Before the conquest of the north of Africa by the Vandals, Martianus Capella wrote an encyclopædia of the seven liberal arts, a very pedantic production, which shows plainly how little the men of the 5th century were capable of liberal scientific conceptions, and more plainly an utter want of taste. The ruling nations were now barbarians, and the conquered nations submitted to them in dull despair. Rutilius Namatinus still composed lively poems, correct in formal details; Vicentius Lerinensis, under the name of Peregrinus, wrote exhortations to maintain genuine Catholic doctrine, in a comparatively educated style; and the works of the founder of papal power, the Roman bishop Leo I. (440-461), are still important for their subject matter, and interesting in their form. But by degrees literary productions became extinct, and most of those who still attempted to write proved only that the infection of barbarism was general. In the first half of this century the Gallic presbyter Salvianus wrote four books against avarice, and a work in which the misfortunes of the time are proved to be well merited punishments; but they are exaggerated, and sound rather garrulous. The aspirations and polish, combined with poverty of thought and phrases, of the Gallo-Roman literature, are eminently conspicuous in the poems and letters of Apollinarius Sidonius. Culture and literature gradually passed into the exclusive possession of the clergy. There

are some Christian poems in existence by Domnulus, and one by Mamertus Claudianus, all rather prosaic. The works of the theologians, as Arnobius (the younger), Cerealis, Gelasius, Honoratius, Salonius, Gennadius, and others, turn chiefly on the relation of the freedom of the will to mercy, and on the person of Christ; others wrote sermons and commentaries on Biblical works. The historical works of the second half of the 5th century are the history by Victor Vitensis of the persecution of the orthodox church by the Arian Vandals, and the chronicles of the Spaniard Idacius, which contain a special account of his native country. The history of the destruction of Troy by the Phrygian Dares, which became the chief source of the Trojan romances of the middle ages, is a forgery of the 5th or 6th century.—See Klotz, *Handbuch der lateinischen Literaturgeschichte* (Leipsic, 1845); Thompson, "History of Roman Literature" (London, 1852); Browne, "A History of Roman Classical Literature" (London, 1853); Munk, *Geschichte der römischen Literatur* (Berlin, 1858-'61); Sellar, "The Roman Poets of the Republic" (Edinburgh, 1863); Bähr, *Geschichte der römischen Literatur* (4th ed., 3 vols., Carlsruhe, 1866); Patin, *Études sur la poésie latine* (2 vols., Paris, 1869); Hübner, *Grundriss zu Vorlesungen über die römische Literaturgeschichte* (2d ed., Berlin, 1869); and especially Bernhardt, *Grundriss der römischen Literatur* (5th ed., Brunswick, 1872), and Teuffel, *Geschichte der römischen Literatur* (2d ed., Leipsic, 1871; English translation, 2 vols., London, 1873).

**LATINI, Brunetto**, an Italian scholar and poet, born in Florence about 1230, died there in 1294. He was the son of Bonacorso Latini, and became a leader of the Guelphs, after whose downfall he was exiled (1260), and spent many years in Paris in teaching philosophy and letters. After the overthrow of the Ghibellines he returned to Florence, where he became a friend and teacher of Dante, and in 1284 held the office of syndic. He was buried in the church of Santa Maria Novella, and he is one of the four personages commemorated by medallions in the cupola of Dante's tomb at Ravenna. His didactic poem *Tesoretto*, which he wrote, as he said, when "Florence was in her splendor," was published in Venice in 1553, besides which he composed various other works in Italian. But his fame rests on his *Livre du trésor*, a philosophical compilation, written in French, because, as he says, "he happened to be in France, and the language was more agreeable and usual than any other," Italian being as yet little used in prose at that period. The first part relates to history, theology, geography, and other subjects, and contains a remarkable allusion to the mariner's compass. The second part treats of ethics, and the third of rhetoric and the art of government. Editions of Buono-Giamboni's Italian translation were published from 1474 to 1824. The French

bibliographer, F. A. P. Chabaille, who died in 1863, published Latini's manuscripts extant in the national library of Paris in his *Documents inédits de l'histoire de France*. A project of Napoleon I. to nominate a commission for publishing the *Livre du trésor* at public expense, with commentaries, was not taken up till May 15, 1855, when it was recommended by the minister of public instruction. Dante, though praising Latini for teaching him how immortality is achieved by man, represents him as having committed a crime, which, according to one of the commentators, refers to a charge of forgery, but which had been indignantly denied by Latini in his *Tesoretto*.—See Ortolani's essay, included in his *Pénalités de l'Enfer de Dante* (Paris, 1874).

**LATINUS**, a king of Latium, and father of Lavinia, whom he gave in marriage to Æneas. (See ÆNEAS.)

**LATITUDE** (Lat. *latitudo*, breadth). **I.** In geography, the distance of a place on the earth's surface from the equator, N. or S., reckoned in degrees, minutes, and seconds of the great circle constituting the earth's polar circumference. (See DEGREE.) Technically expressed, the latitude of a place is its distance from the equator, measured by the angle which the horizon plane of the place makes with the equator, or by the angle which a plumb line at the place makes with the plane of the earth's axis. It is therefore equal to the altitude of the pole of the heavens above the horizon. There are several ways of determining the latitude of a place. 1. The elevation of the pole star, corrected for the effects due to the star's motion round the real pole of the heavens, and for refraction, aberration, &c., gives the latitude. 2. The latitude may be determined by observing the altitude of a known star, when on the meridian; for manifestly the known north polar distance of the star added to the meridian altitude, corrected for refraction, aberration, &c., is the supplement of the altitude of the pole of the heavens, which altitude, as we have seen, is equal to the latitude of the place of observation. 3. If the altitudes of circum-polar stars above and below the pole be observed, the mean of these altitudes (corrected for refraction, aberration, &c.) is the altitude of the pole; that is, is the latitude. 4. The latitude can be determined by an extra-meridional observation of a star at a known hour. For in this case we have: 1, the star's polar distance; 2, the zenith distance at the time (which is the complement of the observed altitude corrected for refraction, aberration, &c.); and 3, the hour angle. That is, we have two sides and an angle (opposite to one of them) of the spherical triangle which has for its angular points the pole, the zenith, and the star. Hence we can determine the third side, which is the zenith distance of the pole, that is, the complement of the latitude. 5. If a star be observed when on the prime vertical, the latitude becomes known without an exact knowl-

edge of the hour, which the preceding method requires. For then we have in the right-angled spherical triangle which has for its angles the star, the pole, and the zenith, two sides known, viz., the polar distance of the star and its zenith distance. The third side, as in the last case, is the co-latitude. This method is more exact in its results if the observation is made with a carefully oriented transit instrument, and the star observed during both the eastern and the western passage of the prime vertical. 6. In Sumner's method, the altitude of a star is observed twice, a known interval of time separating the two observations. 7. The altitude of a star may be determined by observing the meridian altitude of the sun, the polar distance of the sun at the epoch of observation being known from the ephemeris for the year. II. In astronomy, the distance of a heavenly body from the ecliptic, measured by the arc of a great circle perpendicular to the latter, intercepted between the ecliptic and the body. The heliocentric latitude of a planet is its distance from the ecliptic, such as it would appear from the sun.

**LATITUDINARIANS**, the name given specially to certain theologians of the Anglican church, in the latter part of the 17th century, who were generally low churchmen of Arminian principles, aiming to give a philosophical tone to theological discussions, and admitting a greater latitude of doctrine than was allowed either by the Presbyterians and Independents or by the stricter Episcopalians. Most of them were connected with the university of Cambridge. Among the more distinguished of them were Henry More, Cudworth, Chillingworth, Hales, Wilkins, Gale, and Tillotson.—See the "Principles and Practices of certain Modern Divines of the Church of England, abusively called Latitudinarians, truly Represented and Defended by Way of Dialogue," by Fowler, bishop of Gloucester (London, 1670).

**LATIUM**, one of the principal divisions of ancient Italy. The name is variously derived from Latinus, who more probably owed his to that of the region; from *latere*, to be hidden; from *latus*, broad, &c.; but hardly any of the derivations are satisfactory. The boundaries of Latium varied in different periods of Roman history. In the earliest times the name designated a small tract of land S. of the Tiber, inhabited by the Latins; it subsequently extended as far S. as the promontory of Circeii and Anxur or Terracina; and in its latest and widest acceptation it included the lower valley of the Liris, and embraced all the land between the Tiber, the territories of the Sabines and Samnites, Campania, and the Tyrrhenian sea. Pliny calls the southernmost part *Latium Adjectum*, in contradistinction to *Latium Antiquum*. The greater part of the whole territory is an undulating plain, gradually rising from the seashore to the Apennines, with an isolated range of mountains, Mt. Albanus, of which Mt. Algidus and the Tusculan hills are

branches. A part of the coast land between Antium and Terracina was gradually converted into the Pontine marshes by the waters of various streams which found no outlet; all other parts of Latium were renowned for fertility. In the vicinity of Campania some of the choicest wines of Italy were produced. Among the towns of Latium conspicuous in the history of Rome we find, besides the eternal city itself, Alba Longa, Lavinium, Antium, Corioli, Ardea, and Tusculum. The most ancient inhabitants of Latium, the Siculi, were expelled by a people of Pelasgic descent, who there became known as Latins, or *Prisci Latini*, in contradistinction to the later Latin subjects of Rome. They formed a league of 30 cities, of which Alba was subsequently the head. Alba succumbed to Rome, one of its colonies, under Tullus Hostilius, and other Latin towns soon after. Rome entered the league under its sixth king, and became its head under the next and last. On the fall of the Tarquins the Latins regained their independence, and struggled long against the republic to maintain it; but it was finally overthrown by the great victory of the Romans near Mt. Vesuvius (340 B. C.). Several of their towns received the Roman franchise, and others were converted into allied towns, under the general name of *Nomen Latinum*. During their independence, the Latin towns, mostly built on the top of steep and fortified hills, were governed by dictators elected annually, senates, and popular assemblies. Their common meetings, in which federal questions were discussed, were held in a sacred grove at the foot of Mt. Albanus, on the top of which stood a temple of Jupiter Latiaris. An ancient festival in honor of that divinity was adopted by the Romans, retaining its name of *Feria Latina*.

**LATONA** (Gr. *Λητώ*), in Grecian mythology, a daughter of the Titan Cœnus and Phœbe, and mother of Apollo and Diana by Jupiter, to whom she was married before he wedded Juno. It is only by later writers that she is described not as the wife but concubine of Jupiter. According to the fable, Latona, when pregnant, and persecuted by the jealous Juno, could find no rest, the earth being afraid to receive her, while she was constantly pursued by the serpent Pytho. Finally she came to the floating isle of Delos, which gave her refuge, or which, as some accounts state, was created for her after all other parts of the earth had been cursed should they afford her rest. Symbolically Latona seems to have signified the primitive darkness whence sprung Apollo, or the light. She was worshipped only in connection with her children.

**LATOUR**, *Antoine Tenant de*, a French author, born at St. Yrieix in 1808. He studied at Dijon, and at the normal school in Paris, under Michelet, and subsequently became professor in various colleges and a preceptor of the duke of Montpensier, in whose service he remained in exile, as secretary, after the revolution of

1848. He has published several volumes of poems and miscellaneous writings, and has translated into French *Le mie prigioni* of Silvio Pellico, the memoirs of Alfieri, and the dramatic and epic poetry of Manzoni. Among his other works are: *Séville et l'Andalousie* (2 vols., Paris, 1855); *Tolède et les bords du Tage* (1860); *L'Espagne religieuse et littéraire* (1863); *Études littéraires sur l'Espagne contemporaine* (1864); and *Espagne, traditions, mœurs et littérature* (1873). Two volumes of his translation of Calderon appeared in 1873.

**LATOUR D'AUVERGNE, Théophile Malo Corret de**, a French soldier, born at Carhaix, Brittany, Nov. 23, 1743, fell at Oberhausen, Bavaria, June 27, 1800. He entered the French army in 1767, and subsequently the Spanish, and in 1782 served at the siege of Port Mahon. In the service of the French republic he distinguished himself at Chambéry and in the Pyrenees. He refused promotion, saying that he was only fit to command a company of grenadiers. All the grenadier companies being however united in one, he found himself, while still retaining the simple title of captain, at the head of 8,000 men, who as a part of the vanguard of the army soon became the terror of the enemy under the name of "the infernal column." After the peace of Basel (1795) he retired from service, and devoted himself to literary work. Making a sea voyage for his health, he was taken prisoner by an English privateer, but was exchanged in 1797. He re-entered the army as substitute for the son of a friend, fought under Masséna in Switzerland, rejoined his own company in Germany in 1800, and fell by the lance of a uhlan, exclaiming that it was in this manner he wished to die. Napoleon, by order of the directory, at one time sent him a sword with an inscription declaring him to be the first grenadier of France, which he refused to accept, saying: "Among us soldiers there is neither first nor last." A monument was erected on the spot where he fell, and his heart, embalmed and kept in a silver vase, was carried by his company. His name continued till 1814 to be called at roll, when the oldest sergeant answered: "Died on the field of honor." He was the author of a work entitled *Nouvelles recherches sur la langue, l'origine et les antiquités des Bretons* (Bayonne, 1792; reprinted with the title *Origines gauloises*, Hamburg, 1802).

**LATREILLE, Pierre André**, a French naturalist, born in Brives, Nov. 29, 1762, died in Paris, Feb. 6, 1833. He belonged to a poor though distinguished family, and owed his education to friends, one of whom, a merchant, by lending him works on natural history, awoke in him a love for that study. In 1778 the baron d'Espagnac, governor of the Hôtel des Invalides, placed him in the college of Cardinal Lemoine. He studied theology, and was ordained priest in 1786, after which he retired to Brives, where he passed his leisure in the study of entomology. In 1788 he returned to Paris,

where he became intimate with Fabricius, Olivier, and Bosc, and brought to the notice of Lamarck several rare and curious plants. He published at this time a treatise on entomology, and contributed to the *Encyclopédie méthodique*. The revolution drove him from Paris. He was arrested and sentenced to transportation, but the naturalists Bory de Saint-Vincent and Dargelas obtained his freedom. He was again arrested in 1797 as an *émigré*, but was once more saved by influential friends. In 1798 he was placed in charge of the entomological department of the museum of natural history. In 1814 he was elected a member of the academy of sciences. He was appointed assistant professor to Lamarck, and succeeded him in 1829. His writings are very voluminous. Those best known are: *Histoire naturelle des crustacés et des insectes* (14 vols., 1802-'5); *Histoire naturelle des fourmis* (1802); *Genera Crustaceorum et Insectorum* (4 vols., 1806-'9); and *Cours d'entomologie* (1831). He also wrote parts of the "Natural History" of Buffon, and of the entomological part of the *Règne animal* of Cuvier.

**LATUDE, Henri Masers de**, a French prisoner of state, born near Montagnac, March 23, 1725, died in Paris, Jan. 1, 1805. He entered the army while young, but in 1748 went to Paris to study mathematics. Being ambitious of making himself known at court, he obtained an interview with Mme. de Pompadour, and informed her that he had seen a box placed for her in the post, probably for no good purpose. The box came, filled with a harmless powder; and ascertaining that Latude himself had sent it, the marchioness had him cast into the Bastille, May 1, 1749, whence he was transferred to the prison of Vincennes. On June 25, 1750, he escaped, but six days afterward voluntarily gave himself up to the king, who sent him again to the Bastille. The marchioness, piqued that he had not applied to her for mercy, procured his confinement for 18 months in a dungeon, after which he was placed in an ordinary room of the prison. From this place he escaped, Feb. 25, 1756, by means of a long rope ladder prepared with wonderful perseverance from a quantity of linen, and fled to Amsterdam, where he was again arrested on June 1, and reconducted to the Bastille. He was now confined in a dungeon, chained hand and foot, and obliged to sleep upon straw without any covering. While in this condition he submitted to the government some projects of public utility, one of which was adopted, but procured him no better treatment; but in 1762, his dungeon becoming untenable, he was removed to an upper room. In 1764 Mme. de Pompadour died, and Latude, having learned the fact, petitioned Sartine, lieutenant general of police, for his liberty. Sartine demanded the name of the person who had given him the information, and as Latude refused to betray the secret he was doubly ironed and kept on bread and water. Having been removed to Vin-

cennes he again escaped, was again arrested, and finally, after the death of Louis XV., was liberated through the influence of Malesherbes, June 5, 1777. But he was soon after rearrested and thrown into a dungeon at Bicêtre, where he remained for many years. Mme. Legros, having learned his history, determined to obtain his liberty, and at length, with the assistance of the cardinal de Rohan and Mme. Necker, procured his release, March 18, 1784, with the allowance of a small pension, and took him into her house. The French academy decreed a prize to Mme. Legros, in the same year, for her efforts in behalf of Latude. The day after the taking of the Bastille Latude reclaimed his papers and other memorials of his first imprisonment. The whole were publicly exhibited with his portrait in the court of the Louvre, and were instrumental in exciting the populace. In 1793 he brought suit for damages against the heirs of Mme. de Pompadour, and was awarded the sum of 60,000 livres, of which he received only 10,000. He published a *Mémoire de M. de Latude, ingénieur* (Paris, 1789), and several essays. The advocate Thierry published *Le despotisme dévoilé, ou Mémoires de Latude* (3 vols., 1791-'2); and in 1838 was published at Paris *Mémoires inédites de Henri Maseurs de Latude*.

**LAUBAN**, a town of Prussia, in the province of Silesia, on the Queis, 38 m. W. S. W. of Liegnitz; pop. in 1871, 9,082. It has three Protestant churches, a Catholic church, a gymnasium, an orphan house, a public library, a considerable weaving industry, and a brisk trade. It was founded in the 10th century, destroyed during the Hussite wars, and rebuilt in 1435.

**LAUBE, Heinrich**, a German author, born at Sprottau, Prussian Silesia, Sept. 18, 1806. He completed his studies in Halle and Breslau, and was a teacher in Silesia till 1832, when he removed to Leipsic, and subsequently accompanied Gutzkow to Italy. He was expelled from Saxony in 1834, and under arrest in Berlin during nine months, on account of his liberalism, and the publication of his writings was interdicted. He married in 1836 the widow of Professor Hänel of Leipsic, travelled extensively, and resided in that city till 1848, when he became a member of the Frankfort parliament. He resigned in March, 1849, and from the close of that year till 1867 he was director of the court theatre in Vienna, and in 1869-'70 of the new city theatre at Leipsic. In 1872 he founded the city theatre in Vienna, and retired in October, 1874. He acquired celebrity as a representative of the political and literary school of "Young Germany," and published dramas, novels, books of travel, and miscellaneous writings. His principal works are: *Das neue Jahrhundert* (2 vols., Fürth and Leipsic, 1832-'3); *Das junge Europa* (4 vols., Mannheim, 1833-'7); *Reisenovellen* (6 vols., 1834-'7); *Die Gräfin Chateaubriand* (3 vols., Leipsic, 1843); *Das erste deutsche Parlament* (3 vols., 1849); *Der deutsche Krieg* (9 vols., 1863-'6);

and his *Dramatische Werke* (11 vols., 1845-'68). Among his successful comedies is *Die Karlsschüler*, and his finest drama is *Graf Essex*. His later works comprise *Das Burgtheater zu Wien* (1868), *Demetrius*, a dramatic poem (1869), and *Das norddeutsche Theater* (1872).

**LAUD, William**, an English prelate, archbishop of Canterbury, born in Reading, Berkshire, Oct. 7, 1573, executed on Tower hill, London, Jan. 10, 1645. The son of a wealthy clothier, he was educated in the grammar school of his native town, till in his 16th year he entered St. John's college, Oxford, where he obtained a scholarship in 1590 and a fellowship in 1593. He received clerical orders in 1601, became chaplain to Charles Lord Mountjoy, earl of Devonshire, in 1605, and, though holding marriage to be an indissoluble sacrament, performed the rites of matrimony between that nobleman and Lady Rich, whose first husband was still living. He was appointed chaplain to Bishop Nene in 1608, and had held several minor livings when in 1611 he was elected president of St. John's college, Oxford, and became one of the royal chaplains. In 1616 he was presented to the deanery of Gloucester, accompanied King James to Scotland in 1617, became prebendary of Westminster in 1620, and was raised to the see of St. David's in 1621, when he resigned his presidency. In 1622 took place his famous conference with the Jesuit Fisher, in presence of the duke of Buckingham. The result was, according to his diary, that he became "C." to Buckingham; the initial is usually believed to stand for confessor. Under the patronage of this nobleman his rise was rapid. In 1624 he was made a member of the court of high commission, in 1626 bishop of Bath and Wells, in 1627 a privy councillor, and in 1628 bishop of London. He became the confidential adviser of Charles I. in ecclesiastical affairs, succeeded Buckingham in the royal favor, and began to play a foremost part in politics. His first object was to force the Puritans and other dissenters to conformity. "Under his direction," says Macaulay, "every corner of the realm was subjected to a constant and minute inspection. Every little congregation of separatists was tracked out and broken up. Even the devotions of private families could not escape the vigilance of his spies. Such fear did his rigor inspire, that the deadly hatred of the church, which festered in innumerable bosoms, was generally disguised under an outward show of conformity." In 1628 Dr. Leighton, a Scottish theologian, published a book entitled "Sion's Plea against the Prelacy." At the instigation of Laud he was brought before the star chamber in 1630, was condemned to pay a fine of £10,000, was twice publicly whipped and pilloried in Cheapside, had his ears cut off, his nostrils slit open, and his cheeks branded with the letters S. S. (sower of sedition), and was imprisoned 10 years in the Fleet. Laud was now intimately associated with the earl of

Strafford, of whose principle of "thorough" he approved. He became chancellor of Oxford in 1680, of which university he was a liberal benefactor, and was present in 1683 at the coronation of the king in Scotland, urging the forced establishment of episcopacy and uniformity in that country, which resulted in revolt and the adoption of the national covenant. On his return he was promoted to the see of Canterbury, began his administration by the republication of the "Lawful Sunday Sports," and enforced an exact observance of the rubric and a uniform discipline in the cathedral churches. He indicated his preference in the bestowment of benefices for single over married men. His diary records that a cardinal's hat was offered to him, which he declined with the answer that "something dwelt within me which would not suffer that till Rome was other than it is." He became one of the committee of trade and the king's revenue in 1634, a commissioner of the treasury soon after, and a censor of the press under a decree of the star chamber in 1637. The clergy at that time held probably a larger share in the government of England than at any subsequent period. The public odium against Laud caused by his principles and his overbearing temper was greatly increased when the star chamber sentenced Prynne, Burton, and Bastwick to be fined and maimed for libels "against the hierarchy of the church." Immediately after the meeting of the long parliament in 1640 he was impeached for high treason and committed to the tower. After an imprisonment of more than three years, he was brought to trial, defended himself with ability and often with success through a long and wearisome process, and was condemned and executed by a sentence that is now admitted to have been unjust and illegal. His diary was published by Wharton in 1694. The first edition of his complete works is in the "Library of Anglo-Catholic Theology" (6 vols., Oxford, 1847-'9), and a complete edition, including his letters and miscellaneous papers, was published in Oxford in 1857-'60. His principal biographers are Prynne (1644), Heylin (1671), Lawrence (1829), Le Bas (1836), and Baines (1855).

**LAUDANUM**, a name of uncertain origin applied to several tinctures of opium; it should be restricted, however, to the official tincture, which is prepared with  $2\frac{1}{2}$  oz. troy of opium to 2 pints of menstruum consisting of equal parts of water and alcohol. About 13 minims of 25 drops of this tincture are equivalent to a grain of opium. The strength of laudanum may be increased on exposure to evaporation; and when after standing some time it becomes thick, it should be administered with caution, especially to infants. The laudanum of Sydenham is a wine of opium, prepared with saffron, cinnamon, and cloves. It is nearly equivalent to the United States official wine of opium, and is slightly stronger than ordinary laudanum. (See **OPTUM**.)

**LAUDER, Robert Scott**, a Scottish artist, born at Silver Mills, near Edinburgh, in 1803, died April 21, 1869. Showing a taste for art in his youth, he was enabled by Sir Walter Scott to pursue his studies in the trustees' academy, Edinburgh. Subsequently he passed five years on the continent, and in 1838 established himself in London. In 1849 he returned to Edinburgh, where he resided until his death. His best pictures were suggested by scenes in Scott's novels, and comprise "The Trial of Effie Deans," well known by the engraving of it, "Meg Merrilies," "Claverhouse ordering Morton to be Shot," &c. He also produced large Scriptural compositions, one of which, "Christ teaching Humility," was purchased by the Scottish association for the encouragement of art as the commencement of a Scottish national gallery.

**LAUDER, William**, a Scottish literary adventurer, born in the early part of the 18th century, died in Barbadoes in 1771. He was educated at the university of Edinburgh, and failed in several attempts to procure a professorship there, through dislike of his character and disposition. In 1739 he published an elegant edition of sacred Latin poems by Arthur Johnston and others. A few years later he established himself in London as a teacher of Latin, and proposed to publish by subscription an edition of the Latin poetry of Grotius, Masenius, and others, of which only 2 vols. appeared (1752-'3). In January, 1747, he began to publish in the "Gentleman's Magazine" a series of papers, the object of which was to show that Milton, in composing his "Paradise Lost," had borrowed largely from Masenius, Staphorstius, Grotius, and other writers. The substance of these appeared in his "Essay on Milton's Use and Imitation of the Moderns in his 'Paradise Lost'" (1751), the preface and postscript of which were written by Dr. Johnson. A pamphlet by John Douglas, afterward bishop of Salisbury, in vindication of Milton from the accusation of plagiarism, showed that many of the passages cited as plagiarisms had been interpolated from Alexander Hog's Latin translation of "Paradise Lost." Lauder, unable to meet the charge of forgery and imposition, signed a confession of his offence, in the form of a letter to Dr. Douglas, dictated by Dr. Johnson; but he nevertheless published in 1754 another work impugning the fame of Milton, entitled "The Grand Impostor, or Milton detected of Forgery against King Charles the First;" an answer to which, supposed to be from the hand of Johnson, appeared in the "Gentleman's Magazine" of the same year. He subsequently emigrated to Barbadoes, where he kept a school.

**LAUDERDALE, I.** The N. W. county of Alabama, bordering on Tennessee and Mississippi, and bounded S. and W. by the Tennessee river; area, 672 sq. m.; pop. in 1870, 15,091, of whom 5,170 were colored. The surface is hilly, and the soil fertile. Iron ore and limestone abound.

The Florence branch of the Memphis and Charleston railroad terminates at the county seat. The chief productions in 1870 were 24,126 bushels of wheat, 447,155 of Indian corn, 12,526 of oats, and 5,457 bales of cotton. There were 2,380 horses, 1,115 mules and asses, 2,964 milch cows, 4,288 other cattle, 5,984 sheep, and 16,196 swine. Capital, Florence.

**II.** An E. county of Mississippi, bordering on Alabama, and drained by branches of the Chickasawha river; area, 700 sq. m.; pop. in 1870, 13,464, of whom 6,411 were colored. The Mobile and Ohio, the Alabama and Chattanooga, the Alabama Central, and the Vicksburg and Meridian railroads traverse it. The chief productions in 1870 were 140,250 bushels of Indian corn, 23,902 of sweet potatoes, and 3,683 bales of cotton. There were 895 horses, 561 mules and asses, 2,040 milch cows, 4,218 other cattle, 2,314 sheep, and 7,276 swine. Capital, Marion.

**III.** A W. county of Tennessee, separated from Arkansas by the Mississippi, bounded N. in part by Forked Deer river, and S. by the Big Hatchie; area, about 350 sq. m.; pop. in 1870, 10,838, of whom 8,484 were colored. The surface is level or undulating, and the soil fertile. The chief productions in 1870 were 18,669 bushels of wheat, 443,809 of Indian corn, and 6,337 bales of cotton. There were 1,992 horses, 1,123 mules and asses, 2,799 milch cows, 4,727 other cattle, 3,118 sheep, and 22,086 swine. Capital, Ripley.

**LAUDON**, or **Loudon**, **Gideon Ernst**, baron, an Austrian general, born at Trotzen, Livonia, Oct. 10, 1716, died at Neutitzschein, Moravia, July 14, 1790. He was descended from an ancient Scottish family, settled for several centuries in Livonia, and at 15 years of age entered the Russian military service, from which he retired after the peace of Belgrade in 1739, with the rank of lieutenant. Having unsuccessfully applied to enter the service of Frederick the Great of Prussia, he went to Vienna, and received in 1742 a captain's commission in Trenck's corps of pandours, and fought with reputation in the campaigns of Bavaria and the Rhine in 1742-'4. At an affair of outposts near Saverne he was wounded and taken prisoner, but was exchanged, and participated in the second Silesian war against Prussia. Disgusted with the cruelties of his commander, he left the corps, and after the peace of Dresden (1745) remained for several years in obscurity and poverty. Having at length procured a major's commission in a regiment stationed on the Turkish frontier, he married, embraced the Catholic religion, and devoted much time to the study of mathematics and tactics. At the breaking out of the seven years' war he was appointed lieutenant colonel of a partisan corps charged with supporting the movements of the Austrian army, and in a single year, by his activity, courage, and capacity, acquired the rank of general, notwithstanding that the battles in which he participated were generally disastrous to the Austrians. His commission

of general having fallen into the hands of Frederick, the latter sent it to him with a congratulatory letter. In 1758 he contributed to raise the siege of Olmütz, and harassed the retreat of Frederick, receiving for his services the rank of lieutenant field marshal. The next year he crossed the Brandenburg frontier to cover the operations of Marshal Daun, and ended a series of brilliant exploits by deciding the rout of the Prussians at the decisive battle of Kunersdorf, Aug. 12, 1759. Receiving the rank of *Feldzeugmeister*, he gained the battle of Landshut, June 29, 1760, took the fortress of Glatz, and covered the retreat of Daun after the Austrian defeat at Liegnitz, Aug. 15, with so much skill that Frederick exclaimed: "We must learn from Laudon how to retreat; he leaves the field like a conqueror." He crowned his achievements in the seven years' war by taking by assault, without previous investment, Oct. 1, 1761, the important city of Schweidnitz, filled with provisions and munitions of war. During the peace which succeeded he was employed with credit in various public capacities, and in 1766 became a member of the aulic council of war, and in 1769 commandant general of Moravia. For a number of years he lived in retirement at his estate near Vienna, devoting himself to his favorite studies; but upon the breaking out of the Bavarian war of succession he took the field in Bohemia, and by a skillful concentration of his forces on the Isar prevented a junction between Prince Henry of Prussia and Frederick, thereby securing a decided advantage to the Austrians. In 1778 he was made field marshal. His military career terminated with the campaign against the Turks in 1788-'9, the first act of which he brought to a successful conclusion by the capture of Belgrade, for which he was appointed generalissimo. He died soon after removing to his headquarters in Moravia, whither the emperor Leopold II. had sent him after the Turkish war. He was simple in his manners and tastes, averse to securing influence by flattering the weaknesses of the great, and beloved by his troops.

**LAUDONNIÈRE**, **René Goulin de**. See **REBAULT**, **JEAN**.

**LAUBENBURG**, a duchy of northern Germany, since 1865 united with the crown of Prussia, but in point of administration entirely independent. It borders on Lübeck, Mecklenburg, Hamburg, and the Prussian provinces of Hanover and Schleswig-Holstein; area, 454 sq. m.; pop. in 1871, 49,546, all but 155 belonging to the Evangelical church. It has a very fertile soil, extensive forests, and a number of picturesque lakes. The principal river is the Elbe. The chief products are corn, vegetables, flax, hemp, fruit, and lumber; agriculture and cattle breeding are the occupation of the majority of the inhabitants. The diet of the duchies consists, according to the constitution of Dec. 20, 1853, of the *Erblandmarschall*, an office which is hereditary in the family of

Bülow, 2 provincial councillors, and 15 deputies chosen for six years (5 of the noble estates, 5 of the towns, and 5 of the peasants' estates). The provincial councillors are appointed for life, and constitute with the *Erblandmarschall* the *Landrathscollgium*, which shares with the government the right of convoking the diet. The government of the duchy consists of a president (*Landdrost*) and two councillors at Ratzeburg, subordinate to the minister for the duchy of Lauenburg, who resides at Berlin. From 1865 to 1874 this office was held by Prince Bismarck. The highest judicial resort is the supreme court of appeal at Berlin. In the budget for 1873, the revenue and expenditure were estimated at \$313,000 each. The public debt amounted to \$1,224,000. The capital is Ratzeburg, and there are only two other towns, Lauenburg and Mölln.—Henry the Lion of Saxony conquered the duchy of Lauenburg from the Slavic tribe of the Polabs (*i. e.*, dwellers on the Elbe). It then remained for some time a subject of dispute between his descendants and the Saxon dukes of the Ascanian line, until in 1227 it was occupied by Albert I. of Saxony, whose younger son, John I., became in 1260 the founder of a separate line, Saxe-Lauenburg, which became extinct in 1689. In accordance with a family pact, concluded in 1369 with the house of Brunswick-Lüneburg, the duchy fell to the duke of Brunswick-Lüneburg-Celle, after whose death it was inherited by George I., elector of Hanover and king of England. In 1810 it was incorporated with the French department of Bouches-de-l'Elbe; in 1813 it was reoccupied by Hanover, and in 1815 ceded to Prussia, which in the same year transferred it to Denmark in exchange for Swedish Pomerania. By the peace of Vienna, 1864, it was ceded by Denmark to Austria and Russia; and by the convention of Gastein, Aug. 14, 1865, Austria, in consideration of a sum of 1,875,000 thalers, left it to the sole possession of the king of Prussia, who formally took possession of it as duke of Lauenburg, but without consolidating it with his other dominions.

**LAUGIER, Auguste Ernest Paul**, a French astronomer, born in Paris in 1812, died there, April 5, 1872. He was a son of the chemist André Laugier (1770-1832), and a brother of the medical writer Stanislas Laugier (1799-1872). He studied under Arago, became connected with the observatory of Paris, and was employed in naval examinations. He was the first to define the proper motion of solar spots. His discovery and calculation of a telescopic comet in 1842 won for him the Lalande gold medal, and in 1843 he succeeded Savary in the academy of sciences, of which he was president for some time. At the request of Humboldt he was engaged for some years in the improvement of the construction of astronomical clocks. In 1853 he made an exact determination of the latitude of the Paris observatory, estimating it at  $48^{\circ} 50' 11''$ , differing considerably from the earlier deter-

mination of Arago and Mathieu. In 1857 he published a catalogue of the declination of 140 stars, having previously issued one of 53 nebulae. He was associated with Arago in researches on the physics of the globe, and in magnetic and photometric labors; and for a long time he made the observations on the declination and inclination of the magnet for the bureau of longitudes.

**LAUGIER, César de Bellecour**, count de, an Italian soldier and author, of French origin, born at Porto Ferrajo, Elba, Oct. 5, 1789. He served in the French and Italian armies, distinguishing himself in May, 1848, at Curtatone, at the head of the Tuscan forces, against the Austrians; but in 1849 he opposed the Tuscan patriots in the interest of monarchy, and was obliged to seek refuge in Piedmont until the restoration of the grand duke Leopold II., after which he was minister of war till October, 1851. He is one of the most voluminous and able writers of Italy; his principal work is *Fastes et vicissitudes des peuples italiens de 1801 à 1815* (13 vols., Florence, 1829-'32).

**LAUGIER, Jean Nicolas**, a French engraver, born in Toulon in 1785, died near Paris in 1865. He studied under Girodet in Paris, and in the school of fine arts. His engravings of Delorme's "Hero and Leander" (1817), and of Gros's "Plague-stricken at Jaffa" (1831), received gold medals. His subsequent works comprise engravings after Leonardo da Vinci, Raphael, Titian, and other masters, Poussin's "Trance of St. Paul," David's "Leonidas at Thermopylae," and Girodet's "Pygmalion and Galatea," and his portrait of Chateaubriand. While at the Boston athenæum he made a drawing of Stuart's portrait for Léon Coignet's picture of Washington.

**LAUMONITE** (called by Werner efflorescing zeolite, from its property of crumbling at the touch after exposure to the air), a mineral found in cavities in amygdaloidal rocks, and also in syenite and porphyry; named after Laumont the mineralogist, who first observed it in 1785 in the lead mines in Brittany. It occurs in crystals of the form of oblique rhomboidal prisms, and also in lamellar masses. The color is yellowish or grayish white; it is transparent, and has a vitreous lustre, but becomes opaque and usually pulverulent on exposure; hardness 3.5-4; specific gravity 2.3-2.4. In composition it is a hydrated silicate of alumina and lime, a specimen from Phippsburg, Me., giving the following proportions of its ingredients: silica 51.98, alumina 21.12, lime 11.71, and water 15.05=99.86. Some varieties are so liable to effloresce and fall to fine powder, that they can be preserved only by a coating of gum arabic, or by keeping them in moist air. The mineral is found principally in the Faroe islands, the Hebrides, Greenland, and Switzerland, but occurs also on the N. shore of Lake Superior, at Bergen Hill, N. J., and at Port George, Nova Scotia, where the veins are sometimes 3 in. thick.

**LAUNAY, Emmanuel Louis Henri de.** See AN-TRAIGUES.

**LAUNCESTON,** a town of Tasmania, on the Thamar, 90 m. N. by W. of Hobart Town; pop. in 1870, 10,668. There were 22 churches, a grammar school, 33 private schools, three public schools under the board of education, a mechanics' institute with a library of 5,800 volumes, five banks, and three newspapers. Steamers run to Melbourne twice a week, and to Tasmanian ports at less frequent intervals. The town was incorporated in 1858.

**LA UNION,** a seaport town of San Salvador, on the S. W. shore of the subordinate bay of its own name, forming a part of the bay of Fonseca, 100 m. E. by S. of San Salvador city; pop. about 2,000. The situation of the town, in front of the volcano of Conchagua, renders it an extremely hot and unhealthy place. It is nevertheless one of the principal ports of the republic. The aggregate tonnage of the shipping is about 35,000 annually. A railroad to connect La Union with San Miguel was reported in active progress in 1873.

**LAUNITZ.** I. Nikolaus Karl Eduard Schmidt von der, a German sculptor, born at Grobin, Courland, Nov. 23, 1797, died in Frankfort, Dec. 12, 1869. He studied at Rome under Thorwaldsen, whom he assisted in restoring the Æginetan marbles. He spent his last 40 years chiefly in Frankfort, where he executed the Gutenberg monument and other notable works. For the villa Torlonia in Rome he made several statues, and other works of his are at the Hague. II. Robert Eberhard, nephew of the preceding, born in Riga, Nov. 4, 1806, died in New York, Dec. 13, 1870. He studied under Thorwaldsen in Rome, settled in New York in 1828 as a sculptor of tombstones, and was the first instructor of Thomas Crawford. He executed the Battle monument at Frankfort, Ky.; Pulaski monument at Savannah, Ga.; the monument to Gen. George H. Thomas at Troy, N. Y.; and other similar works. He has been called the father of monumental art in America.

**LAURA.** See PETRARCH.

**LAUREL,** a name applied to a number of trees and shrubs, which in many cases are not related to one another. It should be restricted to the genus *laurus* or true laurel, which is the type of the *lauraceæ* or laurel family. This family includes a large number of mostly aromatic trees and shrubs, with alternate, dotted, simple leaves, and perfect or polygamous, apetalous flowers; the anthers have two or four cells, which open from below upward by small valves; the fruit is a one-seeded drupe or berry. The *lauraceæ* are especially natives of tropical regions, but several are found in North America. The genus *laurus* formerly included several hundred species, among them the trees producing cinnamon and camphor, as well as our native sassafras and spice bush; but later botanists have placed these and others in other genera of the same family, leaving only two species to represent the old genus. The true

or noble laurel, *L. nobilis*, is a native of the south of Europe, where it sometimes grows as high as 60 ft., still retaining a shrub-like character by throwing up stems from the base; it is a handsome evergreen, the dark shining leaves of which are wavy on the margin and pleasantly aromatic; the black berries, of the size of small cherries, are also aromatic. The tree is much cultivated in Europe, and is hardy in favorable situations in England and in the southern United States. Several garden varieties are known which differ from the type in the form and color of their leaves. The tree is also called the bay, from the French *baie*, derived from the Latin *bacca*; the term bay was formerly applied to berries generally, but is now restricted to those of the laurel. The custom of crowning successful poets with leaves of this tree gives origin to our expression poet laureate; wreaths of the laurel with the berries (*bacca*) on were formerly placed

Laurel (*Laurus nobilis*).

upon the heads of students who took their degrees, and were hence known as baccalaureates, a name still retained in the universities, and from which, through the French *bachelier*, our word bachelor is derived. In the days of Roman greatness the laurel was considered an emblem of victory and likewise of clemency, crowning the victor, and being borne in the hands of the returning soldiery. It is honorably mentioned by Chaucer as the crown of the knights of the round table. The laurel is of little use except as a decorative plant. The leaves and berries were formerly used in medicine as stimulants; in large quantities they are emetic. A solid oil is obtained from the berries by heat and pressure; it has the consistence of butter, a greenish color, and the odor of the berries; it is still found in commerce as the oil of bays, and has a limited use in veterinary medicine. The leaves, under the name of bay leaves, are used in cookery for flavoring; the better qualities

of figs always come packed with a few bay leaves placed at the top of each box, to repel an insect which is very destructive to the fruit. The only other species, the Canary laurel (*L. Canariensis*), has much larger leaves, but, being a sub-tropical plant, is rarely seen in cultivation.—The Portugal laurel of the European gardens is *prunus (cerasus) Lusitanica*, an evergreen species of cherry, similar in properties to the related cherry laurel. (See CHERRY LAUREL.) The Carolina laurel cherry is *prunus Caroliniana*, another evergreen species related to the cherry laurel, and like that having poisonous properties; its leaves, especially after wilting in the sun, destroy cattle. The Carolina laurel of the English gardens is known with us as the Carolina red bay; it was formerly *laurus Carolinensis*, but is now placed in the genus *Persea*. California or mountain laurel (*oreodaphne Californica*) is a fine tree, sometimes 70 or 100 ft., but usually much smaller; its leaves are pleasantly aromatic, and sometimes used as a spice; its dark-colored, handsomely veined wood is valued for cabinet work.—Among the plants popularly called laurel, but which do not belong to the laurel family, are *magnolia grandiflora*, called big laurel and laurel magnolia; *rhododendron maximum*, the great laurel; *epigaea repens*, the ground laurel or trailing arbutus (see ARBUTUS); and the kalmias (see KALMIA).

**LAUREL**, a S. E. county of Kentucky, drained by Rockcastle river and Laurel creek; area, 288 sq. m.; pop. in 1870, 6,016, of whom 144 were colored. The surface is undulating or hilly, and thickly timbered, and the soil is fertile. The Knoxville branch of the Louisville and Nashville railroad traverses the county. The chief productions in 1870 were 14,146 bushels of wheat, 136,259 of Indian corn, 45,043 of oats, 11,597 of potatoes, 13,600 lbs. of wool, 17,784 of tobacco, and 46,394 of butter. There were 1,351 horses, 1,537 milch cows, 2,526 other cattle, 7,617 sheep, and 7,625 swine. Capital, Loudon.

**LAURENS. I.** A N. W. county of South Carolina, bounded N. E. by Enoree river, and S. W. by the Saluda; area, 812 sq. m.; pop. in 1870, 22,536, of whom 12,632 were colored. The surface is moderately uneven, and the soil, watered by numerous small rivers, is rich and well cultivated. The prevailing geological formation is granite. The Laurens railroad terminates at the county seat. The chief productions in 1870 were 52,246 bushels of wheat, 277,364 of Indian corn, 35,192 of oats, 19,947 of sweet potatoes, 88,554 lbs. of butter, and 7,077 bales of cotton. There were 1,741 horses, 2,037 mules and asses, 3,071 milch cows, 3,924 other cattle, 5,658 sheep, and 10,581 swine; 20 flour mills, and 2 woollen factories. Capital, Laurensville. **II.** A central county of Georgia, traversed by the Oconee river; area, 780 sq. m.; pop. in 1870, 7,834, of whom 3,654 were colored. It abounds in soft limestone, and has an undulating surface, overgrown in

many places with forests. The soil is a fertile sandy loam, resting on a bed of clay. The chief productions in 1870 were 175,298 bushels of Indian corn, 18,229 of sweet potatoes, 22,728 lbs. of wool, and 4,305 bales of cotton. There were 1,037 horses, 586 mules and asses, 2,567 milch cows, 6,733 other cattle, 8,502 sheep, and 9,603 swine. Capital, Dublin.

**LAURENS. I.** Henry, an American statesman, born in Charleston, S. C., in 1724, died there, Dec. 8, 1792. His ancestors were French Huguenots who shared in the exile of the sect at the revocation of the edict of Nantes. He was educated in Charleston, was designed for mercantile life, and passed from school to a counting house in Charleston, from which he was transferred to another in London, in order that he might enjoy a larger field for commercial study and acquaintance. Returning to his native city, he began business for himself, which he pursued with a rare industry and intelligence. As rigid with others as himself, he trained all his agents and subordinates to orderly habits like his own; so that his counting room became a school of discipline, into which the youth was deemed fortunate who could find his way. Although tenacious of his interests as a business man, he was a sturdy opponent of the abuses of power. His contests with the crown judges were frequent, especially in respect to their arbitrary decisions in marine law and the courts of admiralty, and his pamphlets gave remarkable proof of legal ability. Retiring from business, he visited Europe in 1771, put his sons to school in England, made the tour of Great Britain, and spent some time on the continent. In 1774 he was one of 38 Americans, a large proportion of whom were South Carolinians, who signed a petition to dissuade parliament from passing the Boston port bill. Finding, however, that petition was unavailing, and that war was inevitable unless averted by submission, he hastened home to take his part in the patriotic cause, reaching Charleston near the close of 1774. He was made a member of the council of safety, and soon became its president. In 1776 he was elected a delegate to the continental congress from South Carolina, and became its president, which office he held till the close of 1778. He was a frequent correspondent and resolute supporter of Washington. In 1779 he was appointed minister plenipotentiary to Holland, to negotiate a commercial treaty, but was captured on his way thither by a British frigate. He threw his papers overboard, but they were recovered by the enemy. They afforded conclusive evidence of his mission, and also disclosed the fact that Holland had been in secret negotiation with the revolted colonies, which led to a declaration of war by Great Britain against Holland. He was taken to London, and, being known to have been president of the rebel congress, was in October, 1780, closely incarcerated in the tower. His imprisonment continued for nearly 15 months, during which he

was greatly enfeebled, and suffered also from frequent attacks of gout. He was solaced, however, by the kind attentions of many friends, among whom was Edmund Burke. The British government made frequent attempts on his patriotism, but in vain; all that they obtained from him was a petition for his enlargement, in which he stated that he had honestly striven to prevent the final rupture between the crown and the colonies. Though his health was broken when he was released, he received the commission of congress as one of its ministers for negotiating the peace. He proceeded to Paris, where on Nov. 30, 1782, with Franklin and Jay, he signed the preliminaries of the treaty. On his return to America he was welcomed with the highest consideration. Offices were tendered him, which the state of his health and of his private affairs compelled him to decline. By an injunction in his will, his body was burned according to detailed directions of his own, and the remains were collected and buried. He left numerous original and valuable papers, a portion of which have been published in the collections of the South Carolina historical society. **H. John**, an American soldier, son of the preceding, born in South Carolina about 1756, killed there, Aug. 27, 1782. He was educated in England, returned home at the opening of the revolutionary war, and joined the army in 1777. He became aide to Washington, and was frequently his secretary, writing many of his letters and despatches, and was his chief medium of communication with foreigners in the service. He distinguished himself at Brandywine, was wounded at Germantown and again at Coosawhatchie, and was of great service to Moultrie when besieged in Charleston. He was one of the first to mount the British lines at the attack on Savannah, and was prominent in the defence of Charleston when it was besieged by Sir Henry Clinton. After the fall of the latter city he rejoined Washington, and was designated by him as the special representative of the army to proceed to France and appeal to the king for succor. He set out in the autumn of 1781, succeeded in his mission, and returned to his military duties. At the siege of Yorktown he led the forlorn hope and captured one of the two redoubts which were stormed. When operations had ceased in the north he joined the army of the south under Greene, and by his activity checked every effort of the British garrison in Charleston, and confined them for many months to the walls of the city. He was killed in a skirmish on the Combahee river with a marauding party of British. Washington lamented with keen feeling the loss of Laurens, who had shared his confidence and had requited his preference with the most affectionate devotion. Laurens once rushed between him and danger at Monmouth, and afterward shot in a duel Gen. Charles Lee for disrespectful language to his general. His correspondence, which was voluminous, exhibits an easy, grace-

ful, and vigorous style, marked equally by thought, information, and originality, and freedom of opinion. His army correspondence, with a memoir by W. G. Simms, was printed in 1867 for the Bradford club of New York.

**LAURENT, François**, a Belgian historian, born in Luxemburg, July 8, 1810. He studied at Louvain and Liège, where he graduated as a lawyer in 1832. He practised his profession in his native city till 1834, when he became connected with the ministry of justice in Brussels. In 1835 he accepted the professorship of civil law in the university of Ghent, and he was sustained by the government in this post notwithstanding his anti-ultramontane writings. His principal work, *Études sur l'histoire de l'humanité* (14 vols., Brussels and Paris, 1860-'68), is a collective edition of his publications on the various eras of history.

**LAURENTIAN MOUNTAINS**, a range of British North America, extending in its general direction from Labrador in a curve around the S. and W. shores of Hudson bay to the Arctic ocean, upward of 3,000 m. In its E. portion it forms the watershed separating the tributaries of the St. Lawrence river from those of Hudson bay. Beyond the basin of the St. Lawrence it is traversed by two affluents of the bay, Nelson and Churchill rivers; and still further N. it divides for 800 m. the tributaries of Mackenzie river from the streams flowing into Hudson bay. Its general elevation is from 1,500 to 1,600 ft., with some peaks about the Saguenay river of 4,000 ft. It is mostly well wooded with pine or spruce on the summits, and hard wood on the lower elevations and in the valleys. A remarkable feature of the range is the immense number of ponds and lakes, expansions of the streams, that dot its surface. The principal break in its general direction is on the Ottawa river, above Ottawa, where it crosses that stream, sweeps round S. to the Thousand islands near the exit of the St. Lawrence from Lake Ontario, then bends N. W. to the S. extremity of Georgian bay, and continues along the N. E. and N. shores of Lakes Huron and Superior, resuming its general course. The rocks of this range are sedimentary strata, which have become highly crystalline, and are the most ancient known on the American continent. The Canadian geologists have given to this formation the name of the Laurentian system.

**LAURENTIE, Pierre Sébastien**, a French historian, born at Houg, department of Gers, Jan. 21, 1793. He was a professor at Paris, for some time inspector general of studies, and for many years editor of the *Quotidienne* and other journals in the legitimist interest. Among his numerous works are: *De la légitimité et de l'usurpation* (1830); *Histoire de France* (8 vols., 1841-'3; with supplement, 1855); *Histoire de l'empire romain* (4 vols., 1861-'2); and several pamphlets in opposition to Renan (1862-'3).

**LAURENTUM**, an ancient city of Latium, between Ostia and Lavinium, 15 m. S. S. W. of

Rome, and contiguous to the coast. It is said to have been the capital of Latium and the residence of its king when Æneas and the Trojans arrived in Italy. After the establishment of the Roman empire it was incorporated with the neighboring municipality of Lavinium. Laurentum gave name to a territory extending from the mouth of the Tiber to near Ardea, which in imperial times was studied along the shore with the villas of the Roman aristocracy, including those of the younger Pliny and the emperor Commodus.

**LAURIUM** (Gr. *Λαύριον* or *Λαύρειον*), a promontory of Greece, in the southern portion of Attica. Famous silver, lead, zinc, and antimony deposits were discovered here in very remote antiquity, were successfully worked from the time of Themistocles to that of Pericles, and were supposed to have been exhausted in the time of Strabo, about the commencement of our era. In 1863 two agents of a commercial house of Marseilles explored the ancient mines and the adjacent country, purchased the land, and obtained from the government authority to reopen the mines and the right to the ores of argentiferous galena in their neighborhood. The great financial success of the mining operations induced the Greek government to raise claims against the Laurium company, which led to the diplomatic interference of the governments of France and Italy. In 1871 and 1872 the Laurium question completely absorbed public attention in Greece, even causing several ministerial changes. It was finally settled in 1873 by the sale of the mines to a Greek company, which came to an understanding with the government.

**LAURISTON, Jacques Alexandre Bernard Law**, marquis de, a French soldier, born in Pondicherry, India, Feb. 1, 1768, died in Paris, June 10, 1828. At the military school of Paris he was intimate with Bonaparte. In 1792-'3 he served in the armies of the north, of the Moselle, and of the Sambre and Meuse, and distinguished himself at the siege of Valenciennes. In 1796 he left the army; but he was recalled by Bonaparte when first consul, was appointed his aide-de-camp, and accompanied him to Italy. In 1801 he was sent on diplomatic business to Denmark, and in 1802, having been chosen to convey to London the news of the ratification of the treaty of Amiens, was there received with great enthusiasm by the people, who took the horses from his carriage and drew him to Downing street. In 1805 he was sent under Admiral Villeneuve on an expedition to Martinique, where he took Fort Diamond. Ten days later the fleet sailed for Europe, and after an engagement off Cape Ortegal was defeated by Nelson at Trafalgar, Oct. 21. Returning to France, he was placed at the head of a division of the army sent into Germany, and was made governor of Braunau. In 1806 he was commissioned to superintend the surrender of the magazines and arsenals of Venice in accordance with the treaty of Pres-

burg; and in the following year, by Napoleon's orders, he seized on the republic of Ragusa as a reprisal for the Russians having occupied the harbor of Cattaro. His defence of Ragusa against overwhelming odds was his most brilliant exploit. His allies the Turks having taken many Russian prisoners, Lauriston, in order to save their lives, ransomed them with his own money. In 1808 he accompanied Napoleon to Spain; in 1809 he was with Prince Eugène Beauharnais in Italy and Hungary, where he distinguished himself at the battle of Raab. The victory of Wagram was in great measure due to his bringing up 100 cannon in the face of a terrible fire. After the peace he negotiated the marriage of Napoleon with Maria Louisa, for which service he received the title of count and a mission to Russia, where he remained till 1812, when he joined the grand army. After the retreat from Moscow he organized at Magdeburg the 5th corps, occupied Leipsic during the battle of Lützen, turned the right wing of the enemy at the battle of Bautzen, and took Breslau, June 1, 1813. He was made prisoner at Leipsic, and did not recover his liberty till after the peace of Paris. He was treated with regard by Louis XVIII. When Napoleon returned, Lauriston accompanied the king to Béthune and then retired to his estate of Richecourt, where he remained during the hundred days. For this he was appointed peer of France and commander of the infantry of the guard. In 1817 he was created marquis, and in 1820 was called to direct the administration of the royal household. In May, 1821, he was made a marshal of France, and after the campaign in Spain in 1823 was in command of the 2d corps of the reserve. While visiting a celebrated opera dancer, he was struck with apoplexy, and died the next day.—His widow died early in 1873, at the age of 100 years and three months. His eldest son, **AUGUSTE JEAN ALEXANDRE LAW**, marquis de, born at La Fère, Oct. 10, 1790, served in the army, and from 1849 to 1851 in the legislative assembly. He was for a short time under arrest in December, 1851, afterward retired from public life, and died in July, 1860.

**LAUSANNE**, a city of Switzerland, capital of the canton of Vaud, situated near the N. shore of the lake and 31 m. N. E. of the city of Geneva, and about  $\frac{1}{2}$  m. from Ouchy, its port on the lake; pop. in 1870, 26,520. It is built on three steep hills, which project from Mont Jorat, the highest of which is crowned by the old cathedral, 500 ft. above the lake. The gymnasium, which was founded in 1537, was in 1806 converted into an academy, which has three faculties. There is also a theological faculty belonging to the synod of the Free church, a cantonal school, a normal school, an institution for the blind, an insane asylum, a cantonal museum, a cantonal library with more than 90,000 volumes, and several learned societies. The cathedral, a noble Gothic structure completed in the 13th century, is adorned with a lofty tower

and a spire, and contains the remains of St. Bernard de Menthon. The church of St. François is also a very old building, and is memorable for the council assembled within its walls in 1449, in which Felix V. resigned his claims to the popedom. The other remarkable build-

ings are: the old episcopal palace, now the government house, the penitentiary, the charity schools, and the casino or club house. The streets are steep, narrow, and ill paved. The manufactures comprise woollen cloth, paper, leather, and jewelry, and some trade is carried

Lausanne.

on in wine, which is the staple of the canton. Steamboats ply on the lake between Ouchy, Geneva, and other towns; and there are railways to Yverdon, Geneva, Bern, and Vevay. Among the objects of interest are the house in which Gibbon wrote the greatest part of his "Decline and Fall," and the grave of John Philip Kemble, the tragedian, in the cemetery of St. Pierre de Plain near the city. A Celtic burial ground has been discovered about 6 m. N. W. of the city, near Cheseaux.—Lausanne became the see of a bishop in the 6th century; but in 1536 the bishop transferred his seat to Fribourg, as Lausanne had joined the Reformed church. Since then Fribourg has been the residence of the bishop of the diocese, which retained the title of Lausanne till 1819, when it was called Lausanne and Geneva, as the Catholic parishes of the canton of Geneva were united with it. In 1873 the bishop resumed the former title of bishop of Lausanne, as the pope had erected the canton of Geneva into an independent vicariate apostolic. The federal council of Switzerland regarded the change of the title and the territory of one of the Swiss dioceses as an encroachment upon the rights of the confederation, and refused to recognize it. (See SWITZERLAND.)

**LAUZUN, Antonin Nompard de Caumont**, duke de, a French courtier, born about 1633, died Nov. 19, 1723. A poor nobleman from Gascony, he made his fortune at the French court by his elegant manners and wit and dauntless ambi-

tion, and became a favorite of many of the most eminent and beautiful women, and of Louis XIV., who appointed him to various offices. He was about to marry Mlle. de Montpensier, granddaughter of Henry IV., and to take the command of the French army in Flanders, when the intrigues of Louvois and Mme. de Montespan caused him to be detained in prison for many years. He finally recovered his liberty at the instance of the French princess, whom he is supposed to have secretly married. In 1688 he escorted the queen of James II. and her infant son to France, and in 1689 took an active part in the fruitless expedition to Ireland. Although he never fully recovered the good graces of the French monarch, he was raised to the rank of duke in 1692. Mlle. de Montpensier died in 1693, and in 1695, at the age of about 62, he married Mlle. de Durford, a girl of 16. Lauzun figures frequently in the French literature of the 17th century, and even of a later period, particularly in the works of Mme. de Sévigné, La Bruyère, and Saint Simon.—The *Mémoires du duc de Lauzun*, of which various editions have appeared, and a new one by Lacour in Paris in 1858, do not refer to this Lauzun, but to a noted member of the Biron family. (See BIRON, ARMAND LOUIS.)

**LAVA.** See VOLCANO.

**LAVACA**, a S. E. county of Texas, watered by Lavaca and Navidad rivers; area, 926 sq. m.; pop. in 1870, 9,168, of whom 2,707 were col-

ored. It has an undulating surface, partly covered with ash and post-oak timber, and a fertile soil adapted to cotton, sugar, and Indian corn. The chief productions in 1870 were 261,815 bushels of Indian corn, 47,287 of sweet potatoes, 19,508 lbs. of wool, and 3,528 bales of cotton. There were 5,970 horses, 1,058 mules and asses, 21,012 milch cows, 2,553 working oxen, 56,309 other cattle, 10,890 sheep, and 20,494 swine. Capital, Hallettsville.

**LAVAL**, a fortified town of France, capital of the department of Mayenne, on the Mayenne river, 41 m. E. S. E. of Rennes; pop. in 1866, 27,189. There is a considerable trade in wine, brandy, wood, iron, clover, and marble. It has four parish churches of the first grade, a theological seminary, a college, a convent of Trappists, two castles, three hospitals, a public library, iron works, and a considerable linen industry. In 1855 it was erected by Pius IX. into an episcopal see. It was in the environs of Laval that originated in 1791 the royalist insurrection called the Chouannerie. Laval was taken by the Vendean army, and a brilliant victory gained near it over the republicans, in October, 1793.

**LAVAL**, a county of Quebec, Canada, embracing Isle Jesus, which lies at the mouth of the Ottawa river, and is separated from the island of Montreal on the south by the rivière des Prairies; area, 85 sq. m.; pop. in 1871, 9,472, of whom 9,325 were of French origin or descent. Capital, Ste. Rose.

**LA VALETTE**, Antoine Marie Chamans, count de, a French officer, born in Paris in 1769, died there, Feb. 15, 1830. At the breaking out of the revolution he became an officer of the national guard, and he was one of the last defenders of the king on Aug. 10, 1792. Entering the republican army, he distinguished himself on the Rhine and in La Vendée, and gained the confidence of Bonaparte, who appointed him his adjutant and private secretary. He accompanied him to Egypt, and became more nearly allied to him by marrying a niece of Josephine. After the 18th Brumaire he was made postmaster general and count. In 1814 he lost his office, but he reoccupied his post immediately on the departure of Louis XVIII. for Ghent. After the restoration of Louis XVIII. he was arrested for having aided the emperor, and condemned to death. He escaped by the aid of his wife and daughter and three English gentlemen, and went to Munich, where he was kindly received by the king. Mme. de La Valette, after the escape was discovered, was kept for some time imprisoned, and became insane; but she survived until June, 1855. In 1822 La Valette was pardoned and returned to France, where he lived in obscurity. He left a volume of *Mémoires et souvenirs* (Paris, 1831), containing an interesting account of his escape. Napoleon I. bequeathed 300,000 francs to La Valette, of which he received 60,000; in 1855 Napoleon III. paid the remainder to his heirs.

**LA VALETTE**, Jean Parisot de. See VALETTE.

**LA VALLIÈRE**, Françoise Louise de La Baume Le Blanc, duchess de, mistress of Louis XIV., born in Tours in August, 1644, died in Paris, June 6, 1710. After the death of her father, a nobleman and superior officer, her mother married the baron de Saint-Rémy, who was attached to the household of the duchess of Orleans. Introduced at court and appointed maid of honor to Henrietta of England, sister-in-law of Louis XIV., Mlle. de La Vallière soon received the homage of several distinguished persons, whose attentions she discountenanced from a feeling of sincere love and admiration for the king. All who became acquainted with the young lady were struck with her modesty, gentleness, and truthfulness, as well as with her personal charms and varied accomplishments; and the most eminent French writers, as Racine, La Fontaine, and Mme. de Sévigné, bestow the highest encomiums upon her virtues and graces. Her love for Louis XIV. was as enthusiastic as it was disinterested; and after having for some time resisted his advances, she became his mistress in 1661, but on several occasions felt impelled by conscientious scruples to desert her lover, who twice succeeded in bringing her back from the convent in which she had taken refuge. In 1674, however, she left him definitely, and took the veil in the Carmelite convent of the faubourg St. Jacques under the name of Sister Louise. She received the visits of the queen, the duchess of Orleans, and other warm admirers, and, engaged in works of piety and charity, spent the rest of her life in the seclusion of that convent, of which Mme. de Montespan, who had succeeded her as mistress of the king, also eventually became an inmate. She bore four children to the king, two of whom were legitimated, viz., Mlle. de Blois, who married the prince of Conti, and the count of Vermandois. She wrote a work entitled *Réflexions sur la miséricorde de Dieu, par une dame pénitente* (1680), of which a copy, dated 1688, with corrections by Bossuet, was discovered in the Louvre library by M. Damas-Hinard in 1852. The original as well as the corrected work was edited by M. Romaine Cornut (Paris, 1854). A collection of her letters was published in 1767. Among the works based upon her life, the novel of Mme. de Genlis has attained the greatest popularity. Lebrun's "Magdalen" in the Val-de-Grâce in Paris has been said to represent the features of the duchess, but this is now very generally disbelieved. See Arsène Houssaye, *Mlle. de La Vallière et Mme. de Montespan* (Paris, 1860).—Her grand-nephew, LOUIS CÉSAR DE LA VALLIÈRE (1708-'80), was a celebrated bibliophile.

**LAVAL-MONTMORENCY**, François Xavier de, the first Roman Catholic bishop of Quebec, born in Laval, France, March 23, 1622, died in Quebec, May 26, 1708. He was ordained priest in Paris, Sept. 23, 1645, was nominated missionary bishop of Cochin China in 1651, but did not

accept the office, and became archdeacon of Évreux in 1653. He was chiefly known as the abbé de Montigny, one of his family titles. In 1658 he was appointed vicar apostolic of New France, and bishop of Peträa *in partibus*, in opposition to the archbishop of Rouen, who claimed exclusive jurisdiction in Canada. He was consecrated privately, arrived in Quebec June 16, 1659, displayed equal firmness and moderation in overcoming the pretensions of the vicar general of the archbishop of Rouen, and returned to France in 1662 in order to obtain missionaries, nuns, and pecuniary aid for his flock. He founded while there the seminary of Quebec, March 26, 1663, connecting it by name with the seminary of foreign missions in Paris; the deed of foundation was confirmed by letters patent of Louis XIV. in April, 1664. In the following September he arrived in Quebec, and on July 11, 1666, consecrated the church of Notre Dame. Besides his efficient measures for the organization of a parochial clergy, he enacted the most stringent regulations against the sale of intoxicating liquors to the Indians. This brought him into conflict with the colonial authorities, but he triumphed over all opposition. During a second stay in France, in October, 1674, he obtained his appointment as titular bishop of Quebec. This office enabled him to protect the Indians from the injurious intercourse with the whites, and to define the mutual relations of the regular and secular clergy. Having secured sufficient revenues for the support of the seminary and his episcopal establishment, he made a third voyage to France, obtained the nomination of a coadjutor bishop, into whose hands he resigned the administration of his see in January, 1688, and came back to Quebec to reside in the seminary, without taking further part in public affairs. To the seminary he made over his entire estate, and saw it twice burned to the ground. He was distinguished by unblemished purity of life, ardent zeal for religion, and a firmness which bore down all opposition. The Laval university in Quebec is named after him. His life was written by Louis Bertrand de la Tour (Cologne, 1751), and by an anonymous author (Quebec, 1845).

**LAVAL UNIVERSITY.** See QUEBEC.

**LAVATER, Johann Kaspar,** a Swiss mystic and physiognomist, born in Zürich, Nov. 15, 1741, died there, Jan. 2, 1801. He was the son of a physician, a timid, sensitive, imaginative boy, with an aversion to school, but fond of poetry, solitude, and religious reverie. Intended for holy orders, he pursued his studies at Zürich, but was more interested in Klopstock and Rousseau than in controversialists, and sought the revival of piety rather by humble labors as member of an ascetic society than by weighing theological formulas. "Limit yourself at every moment, if you can, to what is nearest to you," was one of his early ethical precepts. Notwithstanding his shrinking nature, his first public act was a vehement pamphlet (1762) as-

sailing an oppressive but influential officer of Zürich, which made it advisable for him to leave his native town for a time. He went to Berlin, then, under Frederick the Great, the centre of intellectual culture in Germany, and continued his studies there, enjoying the friendship of Sulzer and Mendelssohn, and in Barth, Pomerania, under the theologian Spalding. Returning to Zürich in 1764, he entered on the duties of pastor, and the peculiar charm of his mystical discourses, his benevolent character, and blameless life made him warmly and universally beloved. His published sermons and his correspondence soon extended over Europe. In 1767 appeared his *Schweizerlieder*, containing his finest poems, which was followed by his *Aussichten in die Ewigkeit* (3 vols., 1768-'73), the first of a series of works in which he maintained the perpetuity of miracles, the irresistibility of prayer, and the necessity for every person to conceive of God as manifested in Christ crucified in order to be really alive himself. The last doctrine was called his Christomania. He determined to oppose his illumism to the philosophy that was reigning at Paris and Berlin; and having found in the *Palingenésie philosophique* of Bonnet what he deemed a triumphant exposition of Christian faith, he sent a translation of it with remarks of his own to his friend Mendelssohn, the mildest and ablest living advocate of deism, and summoned him either to refute it or to become a Christian. The controversy which ensued excited the greatest interest. Mendelssohn maintained that according to the system of Bonnet it would be as easy to demonstrate the divine origin of Islamism or Buddhism as of Christianity; and Lavater, fearing that his imperious challenge had been intolerant and unkind, withdrew it in a long letter. From that time he was the chief and almost the idol of the mystics. He explained the performances of Gessner and Mesmer by the theory of the Rosicrucians, visited and disputed with Cagliostro under a conviction that he was an envoy of Satan, and was suspected by his contemporaries of almost all heresies, of being an atheist, and of being secretly a high officer in the order of Jesuits. His celebrity was extended into foreign countries chiefly by his *Physiognomische Fragmente zur Beförderung der Menschenkenntnis und Menschenliebe* (Leipsic, 1775-'8), the first elaborate attempt to reduce physiognomy to a science, illustrated with numerous engravings and vignettes, and superior in respect of paper and typography to any book previously issued from the German press. It was the fruit of singularly acute observations from an early period of life, confirmed by the study of a large collection of likenesses of distinguished personages which are introduced into the work. Though he was sometimes deceived, the remarkable skill of Lavater in detecting character by some slight feature was often proved. The new science was widely studied, occasioned

many discussions, and was assailed with ridicule by Lichtenberg at Göttingen, by Nicolai at Berlin, and by Zimmermann in a parody on the physiognomy of tails. The author was visited at Zürich by numerous curious and eminent persons, whose characters he usually judged with sagacity; at a glance he recognized Necker, Mirabeau, and Mercier. He made a long and philosophically impartial commentary on his own physiognomy as displayed in several silhouettes: "A most delicate organization, forming a singular *ensemble*, many of whose parts are in contrast. He delights in high metaphysical speculations, and his intelligence cannot grasp the simplest mechanism. His imagination is extravagant, disordered, immensely eccentric; but it is checked by two severe guardians, good sense and a good heart. He knows much, but is the least erudite of all professional savants. None of his knowledge has been acquired; everything has been in some sort given to him. He loves, and has never been in love." The last years of his life were connected with the efforts of the Swiss for freedom. He had hailed the French revolution with an enthusiasm which was quickly changed to horror. His declamations in the pulpit against the French party caused him to be banished to Basel in 1796. He was soon permitted to return, renewed his pastoral offices, and opposed the oppressive measures of the French directory, till, when Masséna took Zürich (Sept. 26, 1799), he was shot in the streets while encouraging the soldiers and relieving the wounded. The shot is said to have proceeded not from a French but a Swiss soldier, who thus gratified a personal and partisan spite; and though Lavater recognized him he did not divulge his name, but wrote verses of forgiveness. He languished from the wound with severe suffering for more than a year. The original and peculiar character of Lavater was admired by Goethe, who pronounced him "the best, greatest, wisest, sincerest of all mortal and immortal men that I know." Their friendship was however interrupted in consequence of Lavater's portraiture of the non-Christian in his "Pontius Pilate."—A selection from his voluminous works was edited by Orelli (8 vols., Zürich, 1841-'4). His biography was written by Gessner (1802-'3). His work on physiognomy has been issued in various forms in the principal languages of Europe. The best English translation is by Henry Hunter, D. D. (5 vols., London, 1789-'98), the engravings for which were under the superintendence of Fuseli, who also translated his "Aphorisms on Man" (London, 1788). Other translations are by Thomas Holcroft (3 vols., London, 1789-'93; 10th ed., 1 vol., 1858), Morton (3 vols., 1793), and Moore (4 vols., 1797).

**LAVAUUR**, a town of Languedoc, France, in the department of Tarn, on the Agout, 21 m. N. E. of Toulouse; pop. in 1866, 7,376. It has a college, a public library, and a flourishing silk industry. Near it are coal mines. It was the

strongest fortress of the Albigenses, and was in 1211 taken by Simon de Montfort. From 1317 to 1801 it was the seat of a bishop.

**LAVENDER** (*lavandula*, Linn.), a genus of hoary, narrow-leaved, fragrant, sub-shrubby or perennial-herbaceous plants, of the natural order *labiate*, indigenous to the south of Europe, the Canaries, N. Africa, &c. Both the common and botanical names are derived from the latin *lavare*, to wash, either on account of the use made of the distilled water in bathing, or because the flowers were used to scent newly washed linen, whence the expression to be "laid up in lavender." There are several species, but two only which are economically employed. The common lavender (*L. vera*, Linn.) has been long known in gardens, and in deep, dry, warm soil it forms a compact hemispherical bush, flowering abundantly every year. Its flowers are lilac or purple, though a white-flowered variety is known. In the climate of

Common Lavender.

New York it is scarcely hardy, but in the vicinity of Philadelphia considerable quantities are grown for market. The dried flowers are used to make *sachets* or scent-bags for perfuming drawers, and the fresh flowers distilled with alcohol furnish the official spirits of lavender. By distillation with water they yield the fragrant oil of lavender, extensively used in perfumery. The lavender is easily propagated from cuttings, which often send up flower stalks the same season. The second kind, sometimes called French lavender, and sometimes spike or broad-leaved lavender, is *L. spica*. Its oil, called oil of spike, is employed by painters on porcelain and in the preparation of varnishes for artists. The plant has the habit of the common lavender, but more humble and the aspect more hoary, the spikes more dense and shorter; it yields by distillation twice as much essential oil as the preceding. The sweet basil is frequently called lavender in

our gardens; it belongs to the same natural order, but to a different genus. (See *BASIL.*)—Lavender is considered an aromatic stimulant, but is seldom used in medicine alone. The compound spirit of lavender is prepared with oil of lavender, oil of rosemary, cinnamon, cloves, nutmegs, and red saunders, with alcohol and water. This is frequently employed as an adjuvant to other drugs, or as a remedy for gastric disturbance or faintness. From 30 drops to a teaspoonful may be given with sweetened water or on a lump of sugar. In cases of inflammation of the stomach it should be cautiously administered.

**LAVERDIÈRE, Charles H.**, a Canadian historian, born at Château-Richer, Oct. 23, 1826, died in Quebec, March 27, 1873. He was ordained priest in August, 1851, and soon became a teacher in the seminary of Quebec. When the university of Laval was created, the abbé Laverdière was appointed its librarian. While a student he had established, and for several years directed, *L'Abeille*, a college journal, to which he contributed many historical articles. He was distinguished as a local antiquary. He aided in the publication of the "Jesuit Relations" (3 vols., Quebec, 1858); edited and completed the second volume of Ferland's *Cours d'histoire*, after the death of the author; in conjunction with the abbé Casgrain, he collected all the voyages of Champlain, and issued an edition (5 vols. 4to, Quebec, 1870), with extremely valuable notes and a biography of Champlain, and also the *Journal des Jésuites* (4to, 1871), a diary kept for several years by the superior of the Jesuits in Canada, of great historical importance. He also wrote *Histoire du Canada à l'usage des maisons d'éducation*, which was most favorably received; an account of *Notre Dame de Recouvrance à Québec*; and *À la mémoire du R. P. Ennemond Massé, S. J.*, one of the earliest Jesuit missionaries, whose grave at Sillery he discovered and marked by a fine monument. He also edited several works on church music, in which he was a proficient.

**LA VILLEMARQUÉ, Théodore Claude Henri Hersart de**, viscount, a French philologist, born at Quimperlé, Brittany, July 6, 1815. He has published *Barzas-Breiz* (2 vols., 1839; enlarged ed., 2 vols., 1846), containing popular Breton songs with a French text; *Contes populaires des anciens Bretons* (2 vols., 1842); and other works relating to the language and literature of the ancient Bretons, including an edition of Le Gonidec's French-Breton dictionary (2 vols., St. Brienc, 1857). Tom Taylor has translated some of his Breton songs and ballads into English (London, 1865). A new edition of his *La légende celtique en Irlande, en Cambrie et en Bretagne, suivie de textes rares ou inédits*, appeared in Paris in 1864; and in 1865 *Le grand mystère de Jésus*, a mediæval Breton drama, with an essay on the ancient Celtic stage.

**LAVINIUM**, an ancient city of Italy, in Latium, situated near the sea, between Laurentum and

Ardea, about 17 m. S. of Rome. It is said to have been founded by Æneas, shortly after his arrival in Italy, and named by him after his wife Lavinia. He made it the capital of Latium, but it was never in historic times of much political importance; and Strabo speaks of it as presenting the mere vestiges of a city, though still retaining a sacred character. It was customary for the Roman consuls and prætors, when entering on their office, to offer sacrifices here to Vesta and the Penates.

**LAVOISIER, Antoine Laurent**, a French chemist, born in Paris in August, 1743, died on the scaffold, May 8, 1794. He was the son of a rich merchant, studied at the Mazarin college, and learned astronomy from La Caille, chemistry from Rouelle, and botany from Bernard de Jussieu. In 1766 he won a prize from the academy of sciences by his *Mémoire sur la meilleure manière d'éclairer les rues d'une grande ville*. Several other essays, especially his *Mémoire sur les couches des montagnes*, secured him admission to that academy in 1768. To meet the heavy expenditures necessitated by his experiments, he sought and received an appointment as farmer of the public revenue; and he showed himself a skilful administrator no less than an acute philosopher. In 1776 Turgot placed him at the head of the *régie des salpêtres*, and he introduced many improvements into the manufacture of gunpowder. From 1778 to 1785 he gave attention to agriculture, and enriched the science of husbandry by many valuable suggestions. In 1787 he was elected to the provincial assembly of Orleans. In 1788 he became one of the trustees of the bank of discount, and in 1789, as assistant deputy to the constituent assembly, presented an interesting report upon the condition of that institution. He was a member of the commission on weights and measures in 1790, and took great interest in the preparation of the new decimal system. Being in 1791 one of the commissioners of the treasury, he published his essay *De la richesse nationale de la France*, in which he presented a plan for the collection of taxes; this essay, which was to be but the forerunner of a complete treatise upon this important subject, entitles him to a high rank among political economists. But the best of his energies had been devoted to chemical investigations, which he pursued with untiring perseverance from 1772 till his death; in 1786 he had published no fewer than 40 essays or memoirs, giving incontrovertible evidence of great logical power and unparalleled acuteness, while successively embodying the principles out of which chemical science was to be renovated. His discoveries and general influence in this branch of natural philosophy are treated in the article *CHEMISTRY*. His greatest work is his *Traité élémentaire de chimie* (2 vols. 8vo, 1789), a synopsis of modern chemistry, in which he exhibits no less ability as a logician than as a natural philosopher. His physical investigations were also valuable; he

wrote an excellent essay *Du principe constitutif de la chaleur*, first printed in the *Mémoires de l'académie des sciences* in 1777. In his later years his attention was mostly turned to applications of chemistry to physiology, and his two *Mémoires sur la transpiration des animaux* deserve to be particularly noticed. He was collecting all his writings with the ultimate view of remodelling them into a single work, when the course of revolutionary events brought him to a premature end. Dupin, a member of the convention, having on May 2, 1794, introduced an act of accusation against all the farmers of the public revenue, Lavoisier delivered himself up and was imprisoned; on the 6th he was involved in the general sentence of death against the corporation to which he belonged, and two days later he was guillotined. His essays were collected and published by his widow (who afterward married Count Rumford), under the title of *Mémoires de physique et de chimie*, in 2 vols. 8vo. A complete edition of his works has been published under the supervision of the minister of instruction, and at the expense of the government (4 vols., Paris, 1864-'8).

**LAW** (A. S. *legu, lag, lah*, from *leggan*, to lay), in a general sense, a rule of action; in a more restricted one, a rule of human conduct, or collectively a body of regulations adapted to a particular subject. In the civil code of Louisiana it is defined as a "solemn expression of the legislative will." Law, regarded as a body of rules for the direction of the individual in his relations with society, is treated in the articles CIVIL LAW, CODE, COMMON LAW, CRIMINAL LAW, LAW MERCHANT, and MARTIAL LAW; as regards matters of ecclesiastical jurisdiction, in the article CANON LAW; and as regards the mutual rights and relations of states, in the article LAW OF NATIONS.

**LAW, Edward, Lord Ellenborough.** See ELLENBOROUGH.

**LAW, John, of Lauriston,** a British financier, born in Edinburgh in April, 1671, died in Venice, May 21, 1729. He received an excellent education, and manifested at an early age a talent for finance, but became notorious as a gambler and roué. Having killed an antagonist in a duel, he fled to France. Thence he went to Holland, where he made a special study of banking in the great bank of Amsterdam. In 1700 he returned to Scotland, and published a work advocating the establishment of a bank which should hold all the sources of revenue of the state in its own hands, and, treating them as capital, issue notes, and at the same time make a profit by discounting. The proposition was declined by government, and Law went with his scheme to Paris, where it also failed to meet approbation. He was afterward expelled from Paris and other continental cities, but not before he had obtained admission to court circles, and gained large sums by gambling. On the death of Louis XIV., and the accession of the duke of Orleans to the

regency, Law reëntered Paris with a fortune of more than \$500,000 made by gambling. The financial affairs of the French kingdom being at this time in the utmost embarrassment, he soon gained a hearing, and, having secured the patronage of the regent, in 1716 established a bank under royal authority. This institution was authorized to discount bills of exchange, and to issue notes redeemable in specie of fineness equal to that of the current money of the realm. As it accepted at par government bills, on which there was a discount of nearly 80 per cent., and as there was a general want of private credit, its stock was soon taken, and a very lucrative business established. Law, however, aimed higher than this. He believed that, while there was no standard of prices or of money, credit was everything, and that a state might with safety treat even possible future profits as the basis of a paper currency. With this view he established the Mississippi or West India company, based on the scheme of colonizing and drawing profit from the French possessions in North America. This company, enlarging its scope, soon absorbed the French East India company under the general title of the "Company of the Indies." It extended its capital to 624,000 shares of 550 livres each, and engaged itself to lend the king 1,600,000,000 livres at 3 per cent. An extraordinary fever of stock gambling had been gradually excited by these financial efforts, and the result was that the shares of the company rose to 35 or 40 times their original value. Great extravagance resulted. Land near Paris rose to the value of 100 years' purchase, and most objects of commerce in the same proportion. Law was now made comptroller general of the finances, and his power was almost absolute. But the constant decrease of specie in France, and the constant issue of government notes, which by May, 1720, had reached the sum of 1,925,000,000 livres, soon undermined the company. A crash came, the shares sank in value, and Law became a fugitive. It seems, however, to be well established that he was a sincere believer in his own scheme, and that he acted honestly, and with a desire to promote the public welfare. He laid by no money, and when he left France took with him only 800 louis d'or. He travelled for some time afterward in different European countries, and at the invitation of the British ministry finally returned to his native kingdom, being presented on his arrival to George I. by Sir John Norris. On Nov. 28 he pleaded at the bar of king's bench for the royal pardon for a murder, on which occasion he was attended by the duke of Argyll and the earl of Hay. He received from France a pension of 20,000 livres until the death of the regent, and entertained till then hopes of arranging his differences with the French company of the Indies, which claimed from him the sum of 20,236,375 livres. Little by little he sank into obscurity, and finally died in great poverty in Venice. His remains

were buried in the church of San Geminiano, whence in 1808 they were transferred to the church of San Moise by Marshal Lauriston, the grandson of his brother.—Works upon Law and his system are numerous, but it is only within the present century that justice has to any degree been done to the uncommon abilities of which he was really possessed. See Thiers, *Histoire de Law* (published in Paris in 1858, from the *Revue progressive* of 1826; English translation, New York, 1859); Kurtzel, *Geschichte der Law'schen Finanz-Operation* (in Raumer's *Historisches Taschenbuch*, 1846); and Charles Mackay, "Memoirs of Extraordinary Popular Delusions" (London, 1850).

**LAW, William**, an English mystic, born at King's Cliffe, Northamptonshire, in 1686, died there, April 9, 1761. He was admitted into Emmanuel college, Cambridge, in 1705, received the degrees of bachelor and master, and was elected to a fellowship in 1711, which he retained till 1716, when he forfeited it by refusing as a Jacobite to take the prescribed oath of allegiance to George I. He never again officiated in public, though livings were tendered him through his friend Dr. Sherlock, afterward bishop of London. In 1717 he engaged in London in the Bangorian controversy, publishing three letters to the bishop of Bangor which are among his most effective productions. In 1726 he wrote an answer to Mandeville's "Fable of the Bees," an admirable essay, which has been republished separately with an introduction by F. D. Maurice (Cambridge, 1844). He soon became tutor to the father of the historian Gibbon at Putney, accompanied his pupil to the university of Cambridge in 1727, and afterward remained in the family more than ten years. His treatise on "Christian Perfection" appeared in 1726, and was followed in 1729 by his "Serious Call to a Devout and Holy Life," his most popular work. Dr. Johnson mentions it as the first book which made him think in earnest of religion, and styles it the finest hortatory theology in any language. These writings caused him to be consulted as a spiritual adviser by many serious persons, and his piety and wisdom gave him great personal authority. Among those who were instructed by him were the brothers John and Charles Wesley; and a divine named Dr. Trapp in a published discourse, which was answered by Law, attributed the origin of Methodism and other religious movements of the time to his influence and writings. To a young lady who had expressed a desire to be of the Roman Catholic communion he addressed three remarkable letters (1731-'2; first published in 1779). He lived subsequently with Mrs. Hutcheson, and with Hester Gibbon, a sister of his pupil, at King's Cliffe, engaged in exercises of piety, and devoting their combined annual income of about £3,000 to purposes of charity. A school was endowed for the instruction and clothing of 40 boys and girls, which still continues under the name of

Law's and Hutcheson's charities. He published subsequently a few tracts, and a translation of Jacob Boehm (Behmen), which bears his name (4 vols., 1764-'81), but contains little by him besides illustrative mystical figures, having been prepared for the press by Mrs. Hutcheson and Miss Gibbon, and published at their expense. His collected works (9 vols., London, 1762) embrace 16 treatises and a collection of letters. His life was written by Richard Tighe (London, 1813). A volume entitled "Notes and Materials for an Adequate Biography of the celebrated Divine and Theosopher William Law" was printed for the Theosophian library in London in 1856.

**LAWES, Henry**, an English composer, born probably in Salisbury in 1600, died in 1662. About 1625 he became one of the gentlemen of the chapel to Charles I., and soon acquired a considerable reputation as a composer of music for masques and songs. His works are numerous and of unequal merit. Among the most successful was the music to Milton's "Comus," performed at Ludlow castle in 1634, the composer himself personating the "Attendant Spirit." Milton speaks of his strains as "sweetening every musk rose of the dale." Waller, many of whose songs Lawes set to music, Herrick, and Phillips also speak of him in their verses as the great English composer of the day. Lawes continued in the service of Charles until the death of the latter, and at the restoration he composed the anthem for the coronation of Charles II.

**LAW MERCHANT.** This ancient phrase has been defined as synonymous with the law of merchants. It is rather the system of law which the courts of England and the United States apply to mercantile contracts. It is a branch of the common law, inferior in importance to no other, and in many respects quite distinct from any other. The principal subjects embraced within it are the law of shipping, including that of marine insurance; the law of negotiable bills of exchange and promissory notes; and the law of sales; all of which topics are treated of in this work specifically.—The law merchant has grown up gradually, and during the larger part of its existence, slowly. It originated undoubtedly in the customs of merchants. That it stands out in English law more prominently and distinctly than in any other general system of municipal law, may be reasonably ascribed to the greater extent of the commerce of England for many ages. In the earliest records we have distinct intimations that questions in relation to the interests and contracts of merchants came not unfrequently before the courts; and that these questions were decided even then by a reference to the customs of merchants. In doing this the courts only obeyed a necessity, which was felt wherever commerce existed and was respected. It is not to be concealed, however, that the courts did this with some reluctance, and by steps which followed each other only at long

distances. The reasons for this are obvious, and may be discerned the more easily because they have not yet ceased wholly to operate. The common law was, at a very early period, a complicated but well arranged and exceedingly systematic body of law. To know this was the privilege of a few; to administer it gave wealth and dignity to a very few. The law was then a monopoly, and one of very great value, and it was guarded carefully by those who possessed it. But merchants were compelled to find, or to invent, for the various exigencies of their commerce, rules and principles different from those which had grown out of the feudal system, and were intended mainly to govern titles to land and the relations of feudal rank. When these mercantile contracts came before the courts, the same necessity which had led merchants to find and introduce their new rules, acted upon the courts, and induced the courts, more or less willingly, to accept these rules as their rules also, and thus to make them law. But while some of these rules were only modifications of the existing rules of the common law, others of them were very distinct exceptions, and some were positive contradictions. It was perhaps wise in the courts to regard with jealousy rules of law made by no sovereign authority, and neither evidenced nor promulgated in any authentic way; and indeed at all times the established rules which governed the business and the contracts of any set of men must have been recognized as law; and even the Roman civil law acknowledged the binding force of mercantile usage as constituting law. One instance (Digest, L. 14, tit. 2, sec. 9) will show this regard to usage. In the reign of the emperor Antoninus a vessel had been wrecked; a part of her cargo had been thrown over to lighten her, and by this loss the vessel and the remainder of the cargo were saved, and the owner of the property demanded a contribution from the others. Many centuries before this time the merchants and navigators of the Mediterranean had formed a code of laws for their own government, and as it was agreed upon at and promulgated from the island of Rhodes, then a principal centre of commerce, it was known as the Rhodian law. By this law, the claimant would be entitled to contribution under a principle which has come down to our own times, and is now in full force under the name of general average. The claim of the owner of the property lost was submitted to the emperor, and the rescript, or decree, was as follows: "I, indeed, am lord of the earth; but the law (or this law) is the lord of the sea. Whatever the Rhodian law prescribes in the premises, let that be adjudged." The very next rubric makes the ship owner responsible for the acts of the master of his ship. Another (Dig. 4, 9) provides that mariners and certain others shall be responsible for all property committed to their charge. Another (Dig. 22, 2; Code, 4, 83) gives rules which are quite the same with

those that regulate at this day loans on bottomry and respondentia. And another (Dig. 47, 9) provides that fourfold damages should be paid by the plunderer of a vessel in distress. These provisions of the Roman law, with the remains of the law of Rhodes, sufficed for the purposes of commerce until about eight centuries since, when the *Consolato del mare* was promulgated. It is an excellently constructed system, constantly referred to by law writers of continental Europe at this day, and in some instances mentioned by English and American judges. The origin of this code is not certainly known, nor the name of its authors, nor the time or place of its original promulgation. Next to the *Consolato* in time, according to the best authorities, came the "Laws of Oléron." We know that these were collected, reduced to systematic form, and published, as the rules then in force for the regulation of shipping, in the small island of Oléron, off the coast of France. Queen Eleanor was duchess of the province of Guenne, near which Oléron lies, and French writers assert that she caused the preparation and publication of this code. English antiquaries refer it to her son Richard I. But no one certainly knows who was their author, or when they were first in force. This code has been repeatedly published in English, and is most accessible to American students in the first volume of Peters's "Admiralty Reports." Then followed the "Laws of Wisby." This was the name of a convenient port on the W. coast of Gothland, an island in the Baltic, about equidistant from Sweden, Russia, and Germany, and once the emporium of a great commerce. These laws were probably founded upon the laws of Oléron, with which they frequently coincide. A French work called *Le guidon*, and often referred to under that name (the author being unknown), was published about three centuries since. Its whole title, translated into English, is: "A Useful and Necessary Guide to them who deal in Merchandise and send it to Sea." And then we reach the *Ordonnance de la marine* of Louis XIV., published in 1681. It covers the whole ground of maritime law, including insurance. It codifies and systematizes with great skill all existing provisions, whether they were derived from enactment or from usage, and in many instances improves upon them. Chancellor Kent calls this ordinance "a monument of the wisdom of his reign, far more durable and more glorious than all the military trophies won by the valor of his armies."—Passing now over to England, we find even in Magna Charta (1215) a section running thus: "All merchants shall have safe and secure conduct to go out of and to come into England and to stay there, and to pass as well by land as by water, to buy and sell by the ancient and allowed customs, without any heavy tolls, except in time of war, or when they shall be of any nation at war with us." And the next section defines the rights of alien merchants in time of war. In subsequent

reigns, and especially in those of the Edwards, various statutes were passed, expressly *de mercatoribus*, and in most instances securing to them valuable privileges. Such enactments were from time to time repeated, as they are to this day. And the struggle of the courts, and still more of members of the legal profession, to prevent this invasion of the law, is very remarkable. Thus a question early grew up whether "the custom of merchants" was to be regarded as a custom of certain places, differing in one of them from that which it was in others, or as a part of the general law of the realm. After some intimations in favor of the latter view, in 1622 (Winch's Reports, 24) Lord Chief Justice Hobart declared that "the custom of merchants is a part of the law of this realm;" and Coke, in both the 1st and 2d Institutes, declares that "the *lex mercatoria* is part of the laws of the realm." So this question seems to have been finally disposed of. Not so easy was it however to determine, finally and practically, another question which had also arisen. When it was determined that the custom of merchants had become the law merchant, and therefore must be applied to all mercantile contracts between parties who were merchants, it was now asked whether the same law should be applied to the construction and enforcement of the same contracts when they were made between parties who were not merchants. That the law merchant should be confined to persons who were merchants was at first held by the courts (Cro. Jac., 306, A. D. 1613), in a case where the drawee and acceptor of a bill of exchange was sued on his acceptance, and the defendant prevailed, on the grounds that only a merchant would be held on such acceptance, and that it did not appear that the defendant was a merchant at the time when he accepted the bill. In another case occurring 19 years afterward, the same doctrine was held. But in two years more the court had got so far that, the defendant being called a merchant, they held that they would intend that he was a merchant at the time; and 22 years afterward the court in a similar case decided the whole question by declaring that "the custom is good enough generally for any man without naming him merchant." From this doctrine the courts never afterward swerved, though the point continued to be repeatedly raised in argument, and it was not till 1765 that Lord Mansfield finally declared: "The law of merchants and the law of the land is the same. A witness cannot be admitted to prove the law of merchants. We must consider it as a point of law." The importance of this rule depends upon the difference in law between a custom which is so general that it has the force of law, and one which applies only to a contract made under it because it is to be considered as a part of that contract. This distinction is not merely technical, for it rests upon the most substantial foundations. If two men enter into a contract which relates

to some certain subject matter, and upon this an action of law begins which can be determined only by a construction of the contract, one of the parties may insist that it shall be construed in a certain way, because a custom exists in reference to that subject matter and that kind of contract, which gives it that meaning and effect. But, to make out this case, he must prove that this custom not only exists, but is so general, so old and well established, and so widely known and recognized, that a jury may believe as a matter of fact that the custom was in the minds of the parties at the time they made their contract, and that they made it in conformity with custom. Very many cases have been decided on this ground. Thus, in England, a party agreeing to leave in a warren 10,000 rabbits, was held bound to leave there 12,000, because it was proved to the satisfaction of the jury that, as to rabbits, and in that neighborhood, the words one thousand meant 1,200. (3 Barn. and Adol., 728.) So in New York, where one promised to pay 12 shillings per day for every man employed in a certain business, and some of the men worked 12½ hours within the 24, it was held that the employer must pay 15 shillings for such a day, because a custom was shown, applicable to that kind of work, of considering 10 hours in 24 a day's work. (5 Hill, 437.) But it is a very different thing when the question is whether a custom exists, so general as to be a part of the law of the land. Thus, a man promises, by his note in writing dated Jan. 1, to pay to some one \$1,000 in three months from date. The general law says that the money must be paid on the 1st of April. But a custom comes in, which has, after ages of general acknowledgment and practice, acquired the force of law, and this custom adds three days to the three months, and the money is not due until the 4th of April. And then another custom comes in, which by the same means has acquired the same force, and the effect of this is, that if the 4th of April falls on Sunday or any legal holiday, the money is due on the 3d. The practical difference between these two things is this. In the two cases cited of the rabbits and the days' work, whoever relied upon the custom was bound to prove conclusively to the jury its existence and recognition, as a matter of fact; and if it were so proved, the court would instruct the jury as to the legal effect of the fact thus proved. This legal effect would be only that these two persons would be bound by the construction put upon the words by the custom under which they used the words, in the same way in which they would be bound if they had expressly defined those words as having that meaning. But in the other case, no proof would be offered to the jury, nor would the court permit them to listen to any evidence about it. The only question would be, what is the law, not for this bargain only, or for these parties only, but for all parties and in reference to all similar

bargains? But it is the duty of the court to know the law, and it is their exclusive function to determine the law, and to declare it to the jury, whose duty it is, in civil cases certainly, to receive and obey the instructions given to them. But then it may be asked, how could this law merchant, which is by theory a mass or system of these customs, become known to the courts? None of these laws or rules were ever enacted, except, in some instances, after they had acquired the force of law, and it was thought desirable to give them more precision and uniformity. Of few of them is the origin known, either as to time, or parentage, or authority. How then came they to be law? The answer is not difficult if we keep in mind the distinction between a question of fact and a question of law. For the want of remembering this distinction, there is a seeming antagonism in the cases on this subject. Thus, in 1760 the court of king's bench said: "The custom of merchants is part of the law of England; . . . if there be a doubt about the custom, it may be fit and proper to take the opinions of merchants thereon." And in 1765 Lord Mansfield, chief justice, says: "A witness cannot be admitted to prove the law of merchants." But the contradiction between these two principles is apparent only, and both of them are unquestionably sound. Mansfield means that no witness can be admitted to prove to a jury what the law merchant is; it can no more be allowed than it would be to prove in this way the law of real estate or any other branch of law. But if the court are themselves uncertain as to what the law merchant is, they will hear evidence, authority, and argument upon the subject, and ascertain the existence or character of the customs which compose it, as well as they can. Lord Mansfield was in the constant habit of ascertaining from "the city," as the phrase was then, or from "the Trinity house" (a board consisting of eminent merchants), what their customs were; and it was by these means that he laid the foundations, to say no more, of some of the most important departments of the law merchant. And now both in England and the United States it is perfectly well understood that the courts will hear arguments and listen to citations of competent and pertinent authority upon any question of the law merchant, precisely as upon any other question of the law of the land. But when they decide that any rule enters into and forms a part of the law merchant, it has exactly the same force as any other rule of law.

**LAWN**, a word derived from the old English *lawnd* or *lawnd*, land, especially applied to untilled land left between woods, now used for any extent of grass land kept especially for ornamental purposes. When of small extent such land is often called a grass plot; but in gardening, any piece of ornamental grass, large or small, is a lawn. The thick-turfed, close-shaven, dark-green lawns which form so

important a feature in English scenery, are seldom seen in this country for two reasons: the intensity of our summer sun is such that the finer lawn grasses cannot withstand it, and those who lay out grounds have not learned the necessity for a thorough preparation of the land. A turf which is expected to last for an indefinite number of years is generally no better provided for than an annual crop. In making a lawn, expense should not be spared at the outset; the land must be drained if need be, and well and deeply worked, with a good supply of manure. The time for this work is in the autumn, and the sowing may be done then or in spring. In Europe a mixture of grass seeds, sometimes containing a dozen or more kinds, is sown, and the composition varied to suit different lands; each planter has his preferences as to the kinds and proportionate quantity of each, and uses grasses that are scarcely known here even by name. These mixtures have been frequently tried in this country, at a great expense, with the result of showing their unfitness for our climate. With us but three plants can be relied upon to form a good turf, viz.: June or Kentucky blue grass, redtop or bent, and white clover; timothy should always be avoided on account of its tendency to form tussocks or clumps, and orchard grass is still worse in this respect. Some use June grass or redtop alone, others mix either with white clover, and again both grasses are sown together with the addition of clover. A lawn mixture much used consists of Rhode Island bent 8 quarts, creeping bent 3 quarts, redtop 10 quarts, Kentucky blue grass 10 quarts, white clover 1 quart, making a bushel. The Rhode Island bent is a local variety of redtop, and the creeping bent is a closely related grass. Whichever seed or mixture of seeds is fixed upon, a sufficient quantity should be used; on very rich land three bushels to the acre may be enough, but upon ordinary soil at least five bushels are required. If the sowing is done late in the spring, it is customary to sow oats with the grass seed, in order that the growing oats may afford shade to the young grass; the oats should be cut at or before flowering time. The after care of the lawn consists in frequent mowing to cause the grass to spread, rolling to compact the earth about the roots, and the removal by hand of any coarse weeds that may appear. Annual weeds will soon succumb to the frequent mowing. The fertility of the soil must be maintained by annual top-dressings, in which stable manure, unless so well decomposed as to bring in no weed seeds, is to be avoided, but ashes, ground bones, and similar fertilizers employed. The lawn was formerly mown by a scythe, but this process is much simplified by the introduction of lawn mowing machines, moved by hand for small surfaces, and by horse power for large lawns. The present custom is to cut the grass frequently, and leave the clippings to serve as a

mulch to the grass, and ultimately to decay and enrich the soil. There can be no greater ornament to a place than a well kept lawn, and it should not be cut up by useless paths or numerous flower beds. Masses of flowers nowhere appear to such advantage as in a setting of turf, but these should be so judiciously introduced as not to break up the expanse of grass.—Several years ago it was proposed to use *spargula pilifera*, a relative of the common chickweed, as a substitute for grass in lawn making, but it had only a limited application. For covering soils so poor that grass will not grow upon them, the French horticulturists give high praise to a composite, which is said to afford a dense and lasting verdure, *pyrethrum Tehihatcheffi*, from Asia Minor.

**LAW OF NATIONS**, according to Mr. Wheaton, "may be defined as consisting of those rules of conduct which reason deduces, as consonant to justice, from the nature of the society existing among independent nations, with such modifications and deviations as may be established by general consent." International jurisprudence is a science of modern origin. In its present sense the law of nations was quite unknown to the two great states of antiquity. In Greece the amphictyonic council bore in some sort the character of an international tribunal, but it concerned itself chiefly with the internal affairs of the members of the league; the few relations which Greece maintained with foreign nations were defined by special compacts, and the general principles of right were rarely invoked in their adjustment. A nicer sense of international obligation was early evinced by the Roman state. The *collegium fetialium* is said to have been introduced among the religious orders of Rome by Numa Pompilius. It was the office of these *fetiales* not only to perform the ceremonies which attended a declaration of war, but also to arrange truces and to conclude peace. They performed the sacrificial rites with which alliances and treaties were solemnized, were intrusted as the representatives of the state with their enforcement, and guarded the security of foreign ambassadors at Rome. Indeed, Niebuhr expressly styles them "judges of international law." The rules of their procedure in these various functions constituted the *ius fetiale*; but though the order continued to exist until the time of the emperors, the *fecial* law had been in the insolence of conquest often disregarded, and with the world-wide extension of the empire it had necessarily fallen into disuse. The works of Cicero, Sallust, Livy, and other writers of the best age of Rome, do indeed contain allusions which imply a recognized law of nations; yet it is certain that the Roman law, as it existed at the dismemberment of the empire of the West, embodied no system of rules for governing the intercourse of states, or for deciding questions of right which might arise between them.—During the middle ages, the pope was often the judge and arbitrator in

the affairs of nations. His authority reached its height when Alexander VI. presumed to parcel out the new world to Spanish and Portuguese princes. The doctrines involved in the papal grant were supported by the jurists of Bologna, but their reasonableness was denied by a Dominican monk of the time, Francisus à Victoria, professor in the university of Salamanca, who published in 1557 a collection of dissertations entitled *Relectiones Theologicae*. Of these the 5th, *De Indis*, contested the validity of the papal pretensions; and the 6th, *De Jure Belli*, discussed exclusively the law of war. These essays are perhaps the earliest works written in the spirit of the modern international jurisprudence. Grotius mentions them in his *Prolegomena*, but includes them among the productions which, "whether composed by theologians or doctors of law, had, in the discussion of the laws of war, alike mingled and confounded natural law, the divine law, the civil and the canon law, and the law of nations." In 1581 Balthasar Ayala composed a treatise *De Jure et Officiis Bellicis*, which Hallam considers the first systematic one upon the practice of nations in the conduct of war. The honor of being the founder of the science of the law of nations has also been claimed for Albericus Gentilis, a native of Ancona. Gentilis became professor of civil law at Oxford, and attained high rank as a civilian by his works upon the Roman jurisprudence. As advocate of the Spanish embassy in the prize court at London, his attention was directed to questions of international rights; his most remarkable work upon topics of this nature was an essay upon the law of war.—In 1625 appeared at Paris the celebrated treatise *De Jure Belli et Pacis*, by Hugo Grotius. "Grotius was," says Sir James Mackintosh, "without dispute, the first to give a new form to the law of nations, or rather to create a science of which only rude sketches and undigested materials were scattered over the writings of those who had gone before him." Hallam says that the publication of the book marks an epoch in the philosophical, and it may be said in the political history of Europe. It was very early translated into various European languages, and great jurists made it the subject of elaborate commentaries. In 1656 it was made the text of lectures on public law in the university of Tübingen, and in 1661 a professorship was created in Heidelberg for expounding the law of nature and of nations from the writings of its author. The treatise *De Jure Belli et Pacis* is not limited to the law of war and of peace; it embraces also a view of the general principles which should govern the intercourse of nations. In the Roman law, the phrase *ius gentium* was not always used in an exact and specific sense, but it generally signified what modern writers have called the natural law, viz., the principles of right which are dictated by reason, and are common to all men alike. The *ius gentium* might assume the form of posi-

tive enactments, and then it formed an element of the *jus civile*, or municipal law of the state; or, if regarded as the basis and rule of the dealings of states with each other, it signified what is now called international law, or *jus inter gentes*. It was the object of Grotius to show that nations are governed by a law distinct from the natural law, to wit, by a code or body of rules founded indeed in the law of nature, but proceeding immediately from universal consent. "Those right deductions," he says, "which proceed from the principles of reason point to the law of nature, while those which proceed from common consent proceed from the law of nations." Pufendorf, who was invested with the professorship of public law at Heidelberg, rejected the distinction which Grotius had drawn between the law of nature and the law of nations; he denied that the latter was founded upon express consent, but considered it merely the law of nature applied to nations; he maintained, therefore, that the customs and usages which nations observe in war have no legal obligation in them, and consequently that, unless they are directly deduced from the law of nature, they may be rejected at pleasure. Wolf, who represented rather the school of Grotius than that of Pufendorf, admitted with the latter and with Hobbes that, as aggregate bodies of individuals, nations must be in some degree subject to the law of nature, yet maintained that, in their collective capacity, nations acquire a new character and being, different from that of the individuals of whom they are composed; therefore, in its applications to societies of men, the law of nature must undergo some changes and modifications, and thus is derived the voluntary law of nations. Vattel, a disciple of Grotius, assents to this doctrine of the latter, and develops still further his conception of the law of nations. There is an internal, necessary law, he says, resting upon the natural law or dictates of conscience, and therefore immutable; and there is an external, conventional law, which admits deviations from the former, when these involve an invasion of perfect rights. Finally, according to Vattel, the voluntary law, founded on presumed consent, the conventional, framed by express consent, and the customary, proceeding from the tacit consent of nations, compose the positive international law.—The sources of international law are, according to Grotius, natural law, divine law, customs, and special compacts: *natura ipsa, leges divinae, mores, et pacta*. In the celebrated reply made by the British government in 1753 to a Prussian state paper, the law of nations is said to be founded upon justice, equity, convenience, and the reason of the thing, confirmed by long usage. The principle of national justice, founded upon the laws of morality, is, then, the basis of the positive law of nations, that is to say, of the treaties, conventions, and usages which compose it. It is the office of

right reason to apply this natural law of equity to the circumstances of each case; and it is the art of applying this law, according to justice and guided by reason, which renders international jurisprudence a particular science. Treaties and usages offer evidence of the general consent of nations, and are important sources of the law. The customary law of nations is further expressed in manifestoes and declarations of war and in the decisions of prize courts. Finally, the concurrent testimony of the great writers upon the science, and the written opinions which official jurists give to their governments, are further evidence and depositories of the law of nations.—States are the proper and immediate subjects of this international law. A state is defined by Phillimore as "a people permanently occupying a fixed territory, bound together by common laws, habits, and customs into one body politic, exercising, through the medium of an organized government, independent sovereignty and control over all persons and things within its boundaries, capable of making war and peace, and of entering into international relations with other communities." The sovereignty of a state depends upon its existence *de facto* as a state; and until this is recognized by other nations, the state enjoys no share in international rights. When once, however, it is admitted into the society of sovereign states, it is the equal of each of these. States may combine and form a confederacy, in which each retains its independent power and sovereignty, or may form a federal government or composite state, which alone is the sovereign power.—It is the clear right of every sovereign state to maintain its political integrity in the society of nations. It may, therefore, justly assert its independence of and its equality with all other sovereign states, and by all the modes permitted in the practice of nations it may confirm its power and extend its domain, either by the acquisition of new territory, the extension of its commerce, or the development of its internal sources of wealth. All these rights presuppose that of self-preservation. The state may, then, to this end, form alliances, provide land and sea forces, build fortifications, or employ any other usual means for its defence. With these measures other powers have no right to interfere, unless they assume an aggressive character, and seem to threaten the security of such states. Thus a sudden and extraordinary increase of armaments would furnish good reason for demanding an explanation of the object of such warlike preparations. Further, by virtue of its independence, every sovereign state may adopt whatever form of government and whatever political institutions it may prefer, free from the control of any foreign power. Still each state is to remember that all other sovereign states are its equals, and therefore that it may not, by any measures of its private legislation or policy, virtually invade the sovereignty of others. When in 1792 the French national convention declared that it would

render aid to all nations that might wish to recover their liberty, and ordered the decree to be printed in all languages, Great Britain was regarded as justified by the law of nations in treating the resolution as a declaration of war against all nations.—Another clear right of every sovereign state is that of exclusive property in its territory, and therefore of complete inviolability. This right is derived either from conquest or from occupancy, confirmed, as in the case of private individuals, by the right of prescription; or it may rest upon express treaty or conventions with foreign states. As against other powers, the right to territory is exclusive; in respect to its own subjects, the right is paramount, and constitutes what is called the state's right of eminent domain. Mere discovery by the subject of a nation does not give title to his sovereign, unless the sovereign commissioned him to this intent, or subsequently confirmed his claim of discovery by adopting it. Much too depends in respect to right of acquisition upon occupancy. Therefore, in the case of newly discovered lands, not only is some formal act usually considered necessary in taking possession, but the right will hardly be protected and confirmed without use and settlement of the territory. But how far the territorial sovereignty shall extend, even after a settlement, gives rise to very difficult questions of international law. These principles received very ample discussion in our conventions and treaties with Great Britain concerning the northwestern coasts and territory.—The state's exclusive jurisdiction extends of course over all rivers and lakes which are entirely enclosed within its boundaries. But it is difficult to determine rights when a river forms the boundary between or flows through the territory of different states. When a river forms the limit of conterminous states, the presumption is that both of these have the right of navigation in the whole river, though, according to the Roman law, the middle line of the river forms the strict limit between the two. But in respect to rivers which at any part of their course lie within the territory of a single state, the strict rule is, that the right of navigation here, for those even who border upon it higher up in its course, is but an imperfect one, and the right of a passageway may be conceded or withheld as it may seem good to the state through whose domain the river flows. The strictness of this rule was insisted upon by Great Britain against our government in regard to the St. Lawrence. The United States claimed the right of navigation down the river to the ocean, in virtue of their proprietary right in the great lakes through which it passes. By the treaty of 1854 Great Britain conceded to this country the privilege of navigation, subject to revocation, but still, as it had always done, denied our natural right to enjoy it. But by the treaty of 1871 the river was made for ever "free and open for the purposes of commerce to the citizens of the United States, subject to

any laws and regulations of Great Britain or of the Dominion of Canada not inconsistent with such privilege of free navigation." Over straits, or those narrow passages which communicate between two seas, a state may possess an exclusive control if both shores belong to her, and if the navigation of either sea to which they lead be subject to her exclusive power. Thus, while the Black sea belonged exclusively to Turkey, and the Bosphorus and Dardanelles were both bordered by her territory, the jurisdiction over these was rightfully claimed by the Porte. But when the navigation of either of the seas is free, the right to control the straits must be modified by the necessities and rights of commerce. By the treaty of Paris of 1856 the Black sea was opened to the commerce of all nations, and the clause of that treaty excluding all ships of war was abrogated at the close of 1870. A state cannot be completely secure without extending its authority over some portion of the waters which wash its coasts. By the general law of nations, which may however be modified by unquestioned usage or by special compacts, this authority reaches over a marine league, or the distance measured by a cannon shot from the shore at low tide. For the prevention of frauds upon the revenue laws in time of peace, or to prevent war ships of a belligerent power from cruising so near the coast as unfairly to menace homeward or outward bound ships, it is the practice of nations, certainly of Great Britain and the United States, to exercise jurisdiction for these purposes within four leagues from the coast. Over all bays and gulfs, and those parts of the sea which are included within lines drawn between headlands, the state has unquestioned right. The open ocean is the common territory of all nations.—Finally, it is an incident of sovereignty that the state may exercise exclusive jurisdiction over all persons within its limits, whether they be its own subjects or those of foreign states. It has an undoubted right to the service of its citizens, the right to forbid their departure (a power which is actively exercised by some European states), and the right to recall them from foreign countries. It may dismiss foreigners, or by an act of naturalization adopt them into its citizenship. From the principle of exclusive sovereignty it also follows, that the laws of every state govern not only the persons who dwell in it, but control all property, real and personal, within the territory, and all acts done and contracts concluded there. The state concedes no proper force to foreign laws, yet upon the principle of reciprocity, complete or partial, or upon considerations of equity or international comity, they may be recognized and allowed their effect. It is plain that the tenure, the title, and the modes of conveyance of real property must be uniformly governed by the laws of the country where it is situated. Hence it is a rule of the English and American law that a deed or will executed in a foreign country, or

in another state of the Union, must be executed with the formalities which are required in that state in which the land lies. On the European continent, however, a different rule is admitted, and a deed or will, properly executed where it is made, may dispose of real property lying in another jurisdiction, no matter what forms of execution may be demanded there. As to personal property, it is now the well settled rule of international jurisprudence, that the law of the owner's domicile must govern the succession to it wherever the property may be. The municipal laws of states may sometimes have an extra-territorial effect, so far, for example, as to determine the civil and personal capacities of their citizens while residing in foreign countries, or in defining the obligations of contracts made within their territory, but sought to be enforced in foreign jurisdictions. But in neither case will the foreign state resign its control over property lying within its limits, or admit the operation of other laws than its own, when that would prejudice the rights or interests of its citizens, or in any degree infringe its own sovereign authority. The jurisdiction of a state extends also so far as to exempt its sovereign, or his ambassador, or his fleets and armies, from the operation of the laws of a country where they may be. The same exemption extends to its fleets and armies, when they are suffered to pass through a foreign state, and generally to its public ships. These exemptions rest on the promise implied in the comity of nations that no state will exercise its jurisdiction over that which most intimately affects the sovereignty of another. Special conventions may concede to consuls an authority over their countrymen in the foreign states in which they reside. In Christian countries this authority is usually limited to such civil matters as those arising out of disputes between ship masters and seamen, and to the ministerial acts of attesting contracts and protests, and authenticating other mercantile instruments. In criminal affairs the consul's jurisdiction is limited to the infliction of fines, and in grave cases it is his duty to collect evidence, and send the accused to his own country for trial. In semi-civilized and barbarous countries our consuls often possess complete and exclusive jurisdiction over matters relating to their countrymen.—Except as it is modified by treaty, the judicial power of every state is coextensive with its territory. It reaches all offences committed against its laws, whether by its own subjects or by aliens, and whether within its landed domain or on board its ships, public or private, upon the high seas, or on its public ships in foreign ports. As to the return for trial and punishment of offenders who escape to a foreign jurisdiction, see EXTRADITION.—Though sovereign states are equal, so far as essential rights are concerned, yet in respect to titles and similar distinctions, some of them may assert a preëminence over others. Thus, in virtue of the "royal honors" which every empire and

kingdom in Europe enjoys, these powers may claim certain exclusive privileges of a commercial nature, and take precedence of states which are inferior in dignity. To avoid contests or questions of superiority, the order of signature to public instruments has been often determined by lot, by the use of the alphabet, or by the *alternat*, by which latter mode the representative of each government signs first in order the copy intended for his own government.—Every independent power possesses the right to send and to receive embassies. In monarchies the prerogative usually resides in the sovereign. In composite states, like the United States, it is generally reserved to the federal government, that is, to the supreme executive power. By grant from their respective governments, the right of embassy has been often exercised by the governors of great colonial states. Thus, the British governors general of India, the Spanish governors of the Philippines, and the Dutch governors of Java have possessed the right; so have the Dutch, French, and British East India companies. A merely rebellious colony cannot assert a *jus legationis*; but when rebellion has grown to war, and rebels have become enemies, powerful enough to maintain their hostile and independent posture, then they become capable of new rights, including that of negotiation and therefore of embassy. Yet, as to indifferent states, the international position and right of the revolted colony depend on their recognition of it. The state which has the right to send embassies has also the right to receive them, though there is perhaps no perfect obligation in either case, under the positive law of nations. Phillimore says that a state is bound to give audience to an ambassador, and, except under extraordinary circumstances, to receive him for that purpose into its territory and at its court; though, he adds, it may make conditions as to the nationality of the minister, refusing, for example, to receive one of its own subjects. The privilege of continuous residence rests in comity, and is not matter of right. Public ministers are commonly divided into three classes. The first of these comprises ambassadors ordinary and extraordinary, as the mission is limited or indeterminate in point of time, and papal legates and nuncios, ordinary and extraordinary. These all have the representative character, and are entitled to the same honors which the sovereign power would itself receive. Diplomatic agents of this rank can be sent only by crowned heads, the great republics, and other powers which enjoy royal honors. The second class includes envoys ordinary and extraordinary, ministers plenipotentiary, and internuncios of the pope. In the third class are ranked *chargés d'affaires* accredited to ministers of foreign affairs, and consuls, such as those maintained in the Barbary states by the European powers, who bear credentials as public agents of their governments. Ministers resident accredited to the sovereign are sometimes ranked as a sepa-

rate class between *chargés d'affaires* and envoys and ministers plenipotentiary. The public character of an ambassador at a foreign court is recognized upon the production of his letters of credence. In the case of a *chargé d'affaires*, these are addressed by one minister to another. In the case of ministers of all the higher ranks, they are addressed to the sovereign. The full power which authorizes the diplomatic agent to negotiate is in modern times given separately from the letter of credence. During his residence the public minister is entitled to perfect inviolability, and to exemption from the local civil and criminal jurisdiction. This immunity extends also to the members of his household, whether they belong to his own family or to the diplomatic corps, and also to his house and personal property. A consul cannot claim these privileges of exemption which are accorded to public ministers. So far, indeed, as he is impressed with a public character his right extends; but ordinarily he is subject to the local tribunals, like any other resident foreigner. A minister's public mission is terminated by his recall, or by the decease or abdication of his own or of the sovereign to whom he is accredited; by his own declaration to this effect, when on account of any infraction of the law of nations he thinks it his right to do so; by his dismissal from the court at which he is residing; or by the final accomplishment or failure of the object of his mission.—International rights are often defined by specific conventions. As in respect to embassies, so in regard to treaties, the power to make them resides generally in the supreme executive authority. But they will be exactly determined by the fundamental law of the state. In virtue of their full powers, diplomatic agents may sign treaties, but generally these are not binding upon their governments until they are ratified by the supreme authority. Under the constitution of the United States treaties become obligatory only with the advice and consent of the senate. But once ratified in prescribed form, the treaty is binding upon the contracting states, no matter what legislative measures may be required in order to carry it into effect. The constitution gives to the president and senate the treaty-making power. Congress cannot defeat this provision by refusing to pass appropriation bills or other measures, when the engagements entered into are within the constitutional limits. This question has been much considered, especially in its bearing upon Jay's treaty of 1794, and the treaty for the acquisition of Alaska; and the power of congress to withhold laws required by treaties has been asserted in debate, but never finally insisted on. Treaties in the proper sense of the word, like those of alliance or amity, of commerce and navigation, exist only so long as the parties exist who made them. They expire, therefore, if either loses its sovereignty, or if circumstances change so much as to make the treaty utterly foreign to the ex-

isting condition of things. They may also be annulled by the outbreak of war, or expire by their express limitation. Treaties of alliance may be either offensive or defensive, as they engage to render aid, aggressively or defensively, against other powers. In the event of hostilities, the contracting powers become allies against the common enemy; but not so when a state contracts generally to furnish to another a certain definite succor by war supplies in case of war. Apart from its particular engagements, such a state is neutral. Guaranties are frequent forms of international compacts. Agreements to defend the particular constitution of a country against every aggression, or to secure the liberties of a single state during war between other powers, are instances of these obligations.—Sovereign states being equal, it follows that there can be no supreme tribunal of appeal. Except therefore by submission of their wrongs to arbitration, nations can have no redress for them except by resorting to force. When, then, differences have arisen, and they cannot be composed by negotiation or other peaceful means, the injured state may employ the forcible measures of retaliation, of reprisals, of embargo or the sequestration of the goods of the offending power, or, finally, of war. Embargoes or sequestrations are often declared as preliminary measures to active hostilities. A declaration of war has a retroactive effect, and the property already seized is placed upon the same footing as that taken during the war. Reprisals are general or special. They are general when a state authorizes its subjects to capture the goods and attack the subjects of the offending power, wherever they may be found. In the modern practice of nations, general reprisals are deemed synonymous with war, and are indeed the initiative step to hostilities. When wrong is done to particular individuals in time of peace, and justice is plainly refused or unreasonably withheld, letters of marque may be issued to the parties, or a public ship be commissioned to avenge their wrong. These are instances of special reprisals. The ownership of the property taken is acquired, so far as it is necessary to satisfy the debt, or otherwise compensate for the injury committed; the surplus must be restored to the government of the subject against whom the right has been exercised. In modern times letters of reprisal are chiefly confined to goods, and would hardly be granted to a private individual during a general peace.—The precise extent of obligation resting upon a neutral nation to pass and enforce laws in order to prevent its territory being made use of in originating hostile measures against a power with which it is at peace, has never been fully determined. All authorities agree that the government must not aid or give countenance to such measures, but how active it is required to be in thwarting them, and how stringent and effectual its legislation should be to that end, in order to preserve its character as a neutral

and friendly state, were the subject of very earnest discussion in the controversy between the United States and Great Britain preceding the treaty of Washington of 1871, and also at the Geneva conference held under its provisions. In that treaty the British government agreed to the following rules for the future, while not assenting to the claim of the government of the United States that they were in force before. A neutral government is bound : 1, to use due diligence to prevent the fitting out, arming, or equipping within its jurisdiction of any vessel which it has reasonable ground to believe is intended to cruise or to carry on war against a power with which it is at peace; and also to use like diligence to prevent the departure from its jurisdiction of any vessel intended to cruise or carry on war as above, such vessel having been specially adapted, in whole or in part, within such jurisdiction, to warlike use; 2, not to permit or suffer either belligerent to make use of its ports or waters as the base of naval operations against the other, or for the purpose of the renewal or augmentation of military supplies or arms, or the recruitment of men; 3, to exercise due diligence in its own ports and waters, and, as to all persons within its jurisdiction, to prevent any violation of the foregoing obligations and duties. It is probably not too much to say that these rules are regarded by the best authorities of the present day as a correct statement of the duties of a neutral in the particulars covered by them. —An open contest between sovereign states is called a public war. It may be general, extending to all persons and places in the two states, and is then called a perfect war; or it may be imperfect, as it is limited in these respects. Once it was considered necessary to declare war formally before proceeding to hostilities; now it is customary to declare simply that war exists. Forthwith, all enemy property is, by the law of war, subject to confiscation; thus, debts due from one state to the other may be sequestered, or property lying within the territory of either be seized as prize of war. But in the exercise of international comity these rights are not usually enforced. The obligation of debts is, as it were, suspended during war, but the right of recovery revives with the peace; and enemy's ships in port may be allowed to depart, and those on their voyage thither to enter, discharge their cargoes, and sail without molestation. All commerce between the subjects of belligerent states is interdicted by the laws of war; yet for good reasons either power may, by express license, permit a partial intercourse. Very large indulgence was shown in this respect, and for the interests of commerce, by England in the last war with Russia. Provided only that British ships did not enter ports in possession of the enemy, the commerce with the enemy, though indirect, might still be carried on. The interdiction of intercourse between belligerents extends not only to commerce, but to every

species of contract, such as insurance of enemies' property, the drawing of bills on subjects of the enemy, or the remission of funds to them by bills or money. So too partnerships existing between the subjects of hostile states are absolutely dissolved by a declaration of war. In the language of Lord Bacon, war is the highest trial of right. It has also been defined as an exercise of the international right of action. Its end and object is to compel justice from an enemy, and it must be prosecuted with steady regard to that end. All measures of force which must be employed to attain it are justifiable, but no others are permissible. Therefore wanton waste of the enemy's country, or wanton destruction of the property or lives of his subjects, are in the modern practice of nations unjustifiable and illegal. Generally, all those who are engaged in the merely civil affairs of life are exempted from the direct effects of war, and only those who are expressly or impliedly authorized by the commands of the state to represent its sovereignty are ordinarily subjected to hostile attack. Property at sea, however, makes an exception to the usual indulgence shown to the goods of an enemy; for ships and their cargoes upon the ocean are liable without exception during war to seizure and confiscation, and even if captured by uncommissioned cruisers are condemned as good prize of war. The abolition of privateering was proposed to the United States by the governments represented in the congress of Paris in 1856; but the proposition was then declined, and when Mr. Seward in 1861 offered to assent, the offer was declined by Great Britain in view of the then existing circumstances. The validity of all claims of prize and capture is determined by the prize courts of the captor's country. These may sit either within their proper territory or in that of an ally, and exercise jurisdiction over captured property lying either in their own ports or in those of an ally or of a neutral. They possess a jurisdiction, in respect to captures made by subjects of their sovereign, exclusive of the tribunals of all other nations, excepting only in cases when the capture was made upon the territory of a neutral, or by vessels fitted out within a neutral's limits. These cases involve an invasion of the neutral's sovereignty, and must be adjudicated in his court. The decisions of prize courts are final and conclusive upon rights of property involved; and if their judgments work injustice to the subjects of other powers, their claims to reimbursement must be adjusted between the sovereigns of their respective states. The demand for the surrender of Mason and Slidell, the confederate emissaries seized on board the Trent in 1861, was assented to by the United States government, because Capt. Wilkes had neglected to bring the Trent into port in order that the proper adjudication might be had to determine the lawfulness of the seizure. — Either for ordering the general conduct of war, or for

lightening its rigors, belligerent states may enter into general or special conventions. The former are often made at the beginning of the war, and lay down the rules to be mutually observed in the war, respecting the exchange and redemption of prisoners, concerning passports, safe-conducts, and similar matters, or agree to abstain from certain modes of warfare, or from levying contributions on invaded territory. Particular conventions are made during war, and concern either truces or partial suspensions of hostilities or capitulations, that is, surrenders of particular forces or places. The power to conclude a truce is generally implied in the official character of every high officer, like a general or admiral, but not the capacity to make a long or universal armistice; for that amounts to peace, which only a sovereign can make, and therefore it requires either the sovereign's previous special authority or his subsequent ratification. A truce is binding upon the two states whose officers conclude it, and they therefore are liable for every infraction of its terms, but not upon those to whom its existence has not been actually notified; and for the purpose of avoiding the mischiefs which may arise out of ignorance of the truce, it is usual to fix prospectively the time when it shall commence. While the truce lasts all warlike acts and preparations must entirely cease, though it does not hinder acts which are allowable in time of peace. But at the place to which the cessation of hostilities particularly applies, a belligerent may not do what he would be allowed to do at a greater distance. That is to say, one party must not take advantage of the temporary peace to perfect its measures of attack or siege, nor may the other repair breaches in its works, or introduce succors or reinforcements, or indeed do anything which would have been impossible if active hostilities had continued.—No state is bound to take part in the wars in which other powers may be engaged. Yet, though the right to remain neutral be one of the clearest rights of its sovereignty, no independent state can retain the same complete independence which it enjoys in time of general peace. A state of war between some members of the society of nations imposes certain positive obligations and restrictions on all the rest. Except when it is bound to do it by previous treaty stipulations, the neutral state may not render assistance to either belligerent party in the prosecution of war, that is, it must not furnish arms, troops, ammunition, or the like, to either side; and further, in matters which do not directly concern the war, it must not refuse to one belligerent that which it grants to the other. On the other hand, if the state observe strictly the conditions of neutrality, it is entitled to perfect inviolability of its territory, and in other respects to complete immunity from the effects of war. Whether the neutral's exemption can be claimed absolutely for its ships, so as to protect the enemy goods which they carry,

has given rise to one of the most vexed questions in international law. It has never been doubted that the neutral's public ships are exempt from all intrusion, and therefore that they cannot be visited and searched for enemy property. In respect to private merchant ships, the practice of different nations has been widely diverse. By express conventions England has sometimes admitted the rule that "free ships make free goods," but, though admitting it again during the war with Russia, declared expressly that she only "waived" her right to seize enemy goods on board neutral vessels. Especially in its treaties, the United States has advocated the adoption of the rule. By the declaration signed at the congress of Paris in 1856 by the representatives of the chief European powers, the principle that neutral ships may carry enemy goods has finally become established, it may be presumed, in the law of nations. The same declaration sanctions the rule that neutral property, except contraband, is not subject to capture though laden in enemy ships. General trade with belligerents is not interdicted by war. The single restriction imposed on commerce is, that it shall not supply either of the hostile parties with means for carrying on the war. A neutral must not carry goods contraband of war, nor bear despatches, nor transport troops to either of the powers at war. Contraband cannot be easily defined, though the proper criterion is, whether the goods be or not *usus bellici*; that is, whether the goods are peculiarly and specifically adapted to serve the uses of war. Contraband property is subject to confiscation by the captor. The strict construction of the principles of neutrality makes the carrying, perhaps even the selling of contraband property in the neutral's home ports, to be a violation of the neutral character. The United States maintains the contrary doctrine, that both such sale and carriage are consistent with neutrality, though during the transit the goods may be rightfully seized and confiscated. Further, the neutral must not send his ships to blockaded ports, for this would be an intermeddling directly in the war measures of belligerents. But the law of blockade is so strict, that to subject a neutral to its operation, the blockade must exist in point of fact; that is to say, there must be a squadron present, and strong enough to constitute an actual blockade of the port; the neutral must have had due notice of its existence, and must have been guilty of some clear act of violation, either by going in or coming out with a cargo laden after the commencement of blockade. Finally, the neutral must be ready to prove himself that which he professes to be, and his ships must therefore be subject to the exercise of the belligerent right of visitation and search.—When the objects of war are accomplished, peace must be reestablished. Generally this takes place upon the conclusion of a formal treaty of peace between the belligerent states.

The power of making a peace is determined by the fundamental law of every state. Under our constitution the assent of the two houses of congress is essential to a declaration of war; but the president, with the consent of two thirds of the senate, may agree upon a peace. A treaty of peace takes effect from the day when it is ratified. Every act of force or violence subsequent to that is unlawful. Yet the party who is guilty of it is not criminally guilty if he had no notice of the peace; and in the case of a capture under such circumstances, the captor's sovereign is bound to effect restitution of the property. So when a period has been fixed for the cessation of hostilities at a specified locality, and before the period has arrived, but with a knowledge of the peace, a capture has been made, the capture is void. The treaty puts an end to the war, and puts at rest for ever the debated matters which were its cause. It leaves everything in the state in which it finds it. Conquered lands and fortresses remain with the conqueror, unless otherwise stipulated. Generally, things which by the treaty are to be restored must be restored in the condition in which they were taken. Thus if a conqueror has rebuilt a town or fortress, and made it what it was before the siege, he should restore it in that condition; but any new works which he has added he may destroy. The particular peace restored by treaty may be broken by omitting to fulfil its stipulations, or by doing some act which contravenes them. The violation of one article is a breaking of the whole treaty, and ends the peace.—The settlement of international disputes by arbitration, or by the establishment of a special international court for the controversy, has been often resorted to; and in the conspicuous instance of the Alabama claims, that method of arrangement was brought more particularly to the favorable consideration of the civilized world than ever before. There are not wanting those who believe it destined rapidly to supersede the resort to arms, and those who do not share this expectation have reason to believe that the terrible arbitrament of war will be often averted by an agreement upon such courts.—See "Elements of International Law," by Henry Wheaton, and particularly the recent editions by William Beach Lawrence (2d ed., Boston, 1863) and Richard H. Dana (8th ed., Boston, 1866); "Commentaries upon International Law," by Robert Phillimore, M. P. (4 vols., London, 1854-'61); "Lectures on International Law," by Travers Twiss, D. C. L. (London, 1856); "Introduction to the Study of International Law," by Theodore Dwight Woolsey (Boston, 1860; 4th ed., revised and enlarged, New York, 1874); "International Law, or the Rules regulating the Intercourse of States in Peace and War," by Maj. Gen. H. W. Halleck, U. S. A. (New York, 1861; Philadelphia, 1866); and numerous foreign authorities referred to in these. Some initiatory steps

have recently been made looking to an authoritative codification of international law, but they have reached as yet no important result. Dr. Bluntschli of Heidelberg has published a work upon the subject; and Mr. David Dudley Field published "Outlines of an International Code" (New York, 1872).—There is another branch of the law of nations, commonly designated private international law, which supplies the rules under which the ordinary courts of justice determine the rights of private parties, where they arise wholly or in part in a foreign jurisdiction. These rules have been treated elaborately by Judge Story in his "Conflict of Laws" (6th ed., revised and enlarged, edited by I. F. Redfield, Boston, 1865), and recently by Mr. Francis Wharton under the same title (Philadelphia, 1872). A treatise by F. K. Savigny on the same subject has been translated into English (London, 1869). Instead of considering them separately here, we refer to them, in their application to contracts, marriage, and other subjects, under the proper titles. (See also *Lex Locri*.)

**LAWRENCE, John**, an American statesman, born in Cornwall, England, in 1750, died in New York in November, 1810. He emigrated to America in 1767, settled in the city of New York, was admitted to the bar in 1772, and soon established himself in successful practice. An active patriot at the outbreak of the revolution, he served in the army throughout the war, first as aide-de-camp to his father-in-law Maj. Gen. McDougall, and afterward attached to the general staff as judge advocate general. In the latter capacity he conducted the proceedings of the court of general officers appointed to inquire into the case of Major André. On the termination of hostilities he returned to New York, where for many years he was engaged in a large and lucrative professional practice. In 1785-'7 he was a delegate to the congress of the confederation, but was superseded in 1788 in consequence of his advocating the new federal constitution. He was a member of the state senate when in 1789 he was elected the first representative from New York city in the first United States congress. He was a zealous and able defender of the measures of Washington, and a political and personal friend of Hamilton. He was elected to the second congress, and in 1794 was appointed judge of the United States court for the New York district. He resigned in 1796 upon being elected to the United States senate, of which he was for a time president. He supported the measures of President Adams, upon whose retirement he resigned and withdrew to private life.

**LAWRENCE**, the name of ten counties in the United States. **I.** A W. county of Pennsylvania, bordering on Ohio, and watered by Beaver river and its constituents the Mahoning and Chenango; area, 360 sq. m.; pop. in 1870, 27,298. It contains limestone and valuable coal and iron mines; the surface is somewhat uneven and the soil fertile. It is traversed by

the Beaver and Erie canal, and by the Erie and Pittsburgh railroad, and the New Castle and Youngstown branch of the Pittsburgh, Fort Wayne, and Chicago road. The chief productions in 1870 were 235,407 bushels of wheat, 349,353 of Indian corn, 547,783 of oats, 119,777 of potatoes, 63,944 lbs. of flax, 268,127 of wool, 716,229 of butter, and 27,965 tons of hay. There were 6,245 horses, 7,650 milch cows, 7,294 other cattle, 61,373 sheep, and 9,380 swine; 3 manufactories of brick, 3 of brooms, 8 of carriages, 1 of window glass, 16 of iron, 1 of machinery, 5 of saddlery and harness, 5 of woollen goods, 1 distillery, 12 flour mills, 3 planing mills, and 16 saw mills. Capital, New Castle. **II.** A N. W. county of Alabama, bounded N. by Tennessee river, the Muscle shoals of which occur in this part of its course; area, 725 sq. m.; pop. in 1870, 16,658, of whom 6,562 were colored. It has a mountainous surface and a good soil. The Memphis and Charleston railroad passes through it. The chief productions in 1870 were 20,233 bushels of wheat, 519,673 of Indian corn, 14,143 of sweet potatoes, 174,063 lbs. of butter, and 9,243 bales of cotton. There were 2,570 horses, 1,816 mules and asses, 3,748 milch cows, 5,832 other cattle, 5,095 sheep, and 18,627 swine. Capital, Moulton. **III.** A S. county of Mississippi, traversed by Pearl river; area, about 700 sq. m.; pop. in 1870, 6,720, of whom 3,042 were colored. Part of the surface is covered with pine forests. The soil is of various quality. The New Orleans, Jackson, and Great Northern railroad passes through it. The chief productions in 1870 were 140,917 bushels of Indian corn, 21,869 of sweet potatoes, 2,782 bales of cotton, and 15,806 lbs. of rice. There were 1,051 horses, 1,718 milch cows, 1,046 working oxen, 2,622 other cattle, 4,014 sheep, and 8,669 swine. Capital, Monticello. **IV.** A N. E. county of Arkansas, drained by Black river and its branches; area, about 600 sq. m.; pop. in 1870, 5,981, of whom 246 were colored. It has a level or moderately diversified surface, with much fertile soil. The chief productions in 1870 were 47,450 bushels of Indian corn, 15,867 lbs. of butter, and 1,023 bales of cotton. There were 526 horses, 659 milch cows, 1,475 other cattle, and 5,471 swine. Capital, Smithville. **V.** A S. county of Tennessee, bordering on Alabama, and drained by small affluents of the Tennessee river; area, 780 sq. m.; pop. in 1870, 7,601, of whom 565 were colored. It contains valuable iron mines. The surface is chiefly table land, and the soil is fertile. The chief productions in 1870 were 31,321 bushels of wheat, 189,695 of Indian corn, 22,095 of oats, 32,417 lbs. of tobacco, 10,598 of wool, and 522 bales of cotton. There were 1,745 horses, 1,867 milch cows, 2,986 other cattle, 5,520 sheep, and 13,584 swine. There were 6 cotton factories. Capital, Lawrenceburg. **VI.** A N. E. county of Kentucky, separated from West Virginia by Big Sandy river, and drained

by the W. fork of that stream and by Little Sandy river; area, 205 sq. m.; pop. in 1870, 8,497, of whom 121 were colored. Coal and iron are abundant. The surface is hilly, and in many places well timbered, and the soil is of excellent quality. The chief productions in 1870 were 11,237 bushels of wheat, 222,659 of Indian corn, 29,782 of oats, 16,626 of potatoes, 11,935 lbs. of tobacco, and 12,918 of wool. There were 1,054 horses, 1,474 milch cows, 1,361 working oxen, 2,291 other cattle, 8,454 sheep, and 9,430 swine. Capital, Louisa. **VII.** A S. county of Ohio, separated by the Ohio river from West Virginia and Kentucky; area, 430 sq. m.; pop. in 1870, 31,380. It has rich mines of iron and coal, and beds of clay suitable for stone ware, and is the chief seat of the iron manufacture in the state. The surface is broken by sandstone hills, but the soil of the valleys is rich. The Iron railroad passes through it. The chief productions in 1870 were 116,058 bushels of wheat, 523,858 of Indian corn, 71,987 of oats, 52,054 of potatoes, 33,370 lbs. of tobacco, 19,336 of wool, 187,174 of butter, and 5,103 tons of hay. There were 2,522 horses, 2,316 milch cows, 5,593 other cattle, 8,512 sheep, and 9,747 swine; 11 manufactories of charcoal, 11 of cooperage, 22 of iron, 1 of engines and boilers, 3 of saddlery and harness, 21 of tin, copper, and sheet-iron ware, 2 planing mills, 7 saw mills, and 4 flour mills. Capital, Ironton. **VIII.** A S. county of Indiana, watered by the E. fork of White river; area, 433 sq. m.; pop. in 1870, 14,628. The surface is undulating and well timbered, and the soil is fertile. The Louisville, New Albany, and Chicago, and the Ohio and Mississippi railroads pass through it. The chief productions in 1870 were 139,340 bushels of wheat, 591,824 of Indian corn, 127,640 of oats, 30,229 of potatoes, 10,073 lbs. of tobacco, 55,843 of wool, 213,125 of butter, and 5,264 tons of hay. There 5,266 horses, 1,516 mules and asses, 3,564 milch cows, 9,984 other cattle, 19,984 sheep, and 23,489 swine; 3 flour mills, 2 saw mills, and 1 manufactory of tobacco and cigars. Capital, Bedford. **IX.** A S. E. county of Illinois, separated from Indiana by the Wabash river, and intersected by its tributary the Embarras; area, 560 sq. m.; pop. in 1870, 12,533. The surface is diversified, and is occupied partly by fertile prairies and partly by swamps. The Ohio and Mississippi railroad traverses it. The chief productions in 1870 were 264,134 bushels of wheat, 656,363 of Indian corn, 131,386 of oats, 33,855 of potatoes, 41,220 lbs. of wool, 93,941 of butter, and 7,701 tons of hay. There were 4,375 horses, 3,053 milch cows, 4,963 other cattle, 15,482 sheep, and 17,654 swine; 5 carriage factories, and 3 flour mills. Capital, Lawrenceville. **X.** A S. W. county of Missouri, drained by Sac river and the head streams of Spring river; area, 573 sq. m.; pop. in 1870, 13,067, of whom 259 were colored. It has a hilly and undulating surface, and a good soil. Coal is found in the

N. W. part. The Atlantic and Pacific railroad passes through the S. E. corner. The chief productions in 1870 were 135,838 bushels of wheat, 621,495 of Indian corn, 222,723 of oats, 40,225 of potatoes, 21,770 lbs. of tobacco, 24,514 of wool, 148,164 of butter, 2,696 tons of hay, and 66 bales of cotton. There were 6,917 horses, 991 mules and asses, 4,043 milch cows, 6,149 other cattle, 12,444 sheep, and 22,076 swine; 5 flour mills, 8 saw mills, and 3 wool-carding and cloth-dressing establishments. Capital, Mount Vernon.

**LAWRENCE**, a city and one of the shire towns of Essex co., Massachusetts, situated on both sides of the Merrimack river, here crossed by two bridges, about 26 m. from its mouth, 22 m. N. of Boston, and 10 m. N. E. of Lowell; pop. in 1850, 8,282; in 1860, 17,639; in 1870,

the N. section of the city is a common of 17½ acres, ornamented with a fountain, the water for which is supplied by a reservoir on Prospect hill, an eminence 140 ft. high. In the S. section are Union square and a trotting park. The city cemetery is in the N. W. part of the N. section. The principal public buildings are the county court house, county jail, city hall, high school building, masonic temple, music hall, and odd fellows' hall. Railroad communication is furnished by the Boston and Maine, the Eastern, the Manchester and Lawrence, and the Lowell and Lawrence lines, and horse cars run to the adjoining towns. The industry of Lawrence is chiefly devoted to cotton and woollen manufactures. Water power is collected by a dam across the Merrimack, built in 1845-'8 at a cost of \$250,000. It is a

City Hall, Lawrence.

28,921, of whom 12,717 were foreigners. There were 5,287 families and 3,443 dwellings. The Spicket river crosses the N. portion of the city and falls into the Merrimack, and the Shawsheen forms a portion of the S. and E. boundary. Near the centre of

\$200,000. These works were constructed by the Essex company, incorporated in 1845, which still controls them, selling and leasing mill sites. The statistics of the principal cotton and woollen manufacturing establishments appear in the following table:

CORPORATIONS.	Date of incorporation.	Capital.	No. of looms.	Spindles.	Operatives.	Yards manufactured per week.
Atlantic cotton mills.....	1846	\$1,500,000	1,800	87,000	1,250	430,000
Lawrence duck company.....	1853	300,000	70	8,000	250	25,000
Pacific mills.....	1853	2,500,000	8,672	136,609	4,299	50,000
Washington mills.....	1858	1,650,000	1,265	61,560	2,900	.....
Everett mills.....	1860	800,000	788	33,000	1,060	135,000
Pemberton company.....	1860	450,000	669	28,000	850	100,000
Lawrence woollen company.....	1863	150,000	40 (broad)	.....	120	.....
Arlington woollen mills.....	1865	240,000	880	4,480	850	.....
Total.....	.....	\$7,590,000	8,634	358,649	11,079	.....

The Pacific mills have extensive print works, and the Washington mills a large dye house. The Atlantic mills manufacture sheetings and shirtings; the Pacific mills, calicoes, shirtings, lawns, delaines, alpacas, serges, and other worsted dress goods; the Washington mills, cam-

brics, shawls, broadcloths, doeskins, opera flannels, and other worsted goods; the Everett mills, cotton fancy cassimeres, gingham, poplins, pantaloons stuffs, and dress goods; the Pemberton company, a variety of cotton and woollen goods; the Arlington mills, ladies'

worsted and cotton dress goods. There is a variety of other manufactories, including one of cordage, four of leather belting, one of cloth boots and shoes, two of cabinet ware, five of carriages, one of earthenware, one of files, one of screws, one of linen hose, six of paper, a brass foundry, and several machine shops, turning out steam engines and boilers, cotton machinery, &c. The city contains three national banks, with an aggregate capital of \$725,000, and three savings banks, with deposits in 1873 amounting to \$3,768,483 21. It is divided into six wards, is governed by a mayor, with a board of aldermen of one member and a common council of three members from each ward, and has a police force and a fire department. Water works, to supply the city from the Merrimack, are in process of construction. The assessed value of property in 1873 was \$21,715,362; total taxation, \$362,827 80, including \$37,581 70 for state and county purposes. The expenditures for city purposes amounted to \$336,150 28, the largest items of which were \$40,683 83 for streets, \$59,164 63 for schools, \$19,386 66 for salaries, \$19,351 78 for paving, \$14,851 25 for fire department, and \$28,078 31 for police. The net debt at the close of the year was \$432,988 59. There are an almshouse, a Catholic orphan asylum, a city mission, and an industrial school. The public schools are graded and in a flourishing condition. The number of children of school age in 1873 was 5,141; number of schools, 59 (1 high, 22 grammar, 1 mixed, 12 middle, 23 primary); of teachers and sub-teachers, 88; pupils enrolled, 4,000; average attendance, 2,500. Evening schools are opened during the winter. There are also Catholic schools attended by about 1,200 pupils. The public library contains about 14,000 volumes; the library of the Pacific mills, 6,000; and there is a circulating library, with 3,000 volumes. Two daily and four weekly newspapers are published, and there are 21 churches, viz.: 2 Baptist, 5 Congregational, 2 Episcopal, 1 Freewill Baptist, 3 Methodist, 1 Presbyterian, 5 Roman Catholic (1 French), 1 Unitarian, and 1 Universalist.—The town of Lawrence was incorporated in 1847, its territory being taken from the towns of Methuen and North Andover. The village had previously been known as Merrimack or New City, and it took its present name in honor of its principal founders, the Lawrence family of Boston, the chief members of the Essex company, which had been chartered shortly before for the erection of the dam and other manufacturing purposes. It was made a city in 1853. On Jan. 10, 1860, the main building of the original Pemberton company, built in 1853, while the machinery was in motion, suddenly fell without warning, and a conflagration soon afterward broke out in the ruins. Of 700 persons in the building at the time, 77 were killed and 134 injured, of whom 14 subsequently died. The cause of the disaster was the faulty construction of the iron pillars which

supported the floor timbers, and lack of adhesive power in the mortar.

**LAWRENCE**, a city and the capital of Douglas co., Kansas, on both banks of the Kansas river, here spanned by two bridges, 70 m. above its mouth, 25 m. E. by S. of Topeka, and 28 m. S. W. of Leavenworth; pop. in 1860, 1,645; in 1870, 8,320. It is built on a rolling slope, and is regularly laid out, with wide streets, partly shaded with trees, and lighted with gas. There are many handsome buildings. Massachusetts street, the principal business thoroughfare, is built up for two thirds of a mile with blocks of brick and stone. The state university, a large and handsome structure, is situated in the S. W. part of the city, upon a bluff called Mount Oread. Lawrence has an important trade, communicating with the surrounding fertile and well timbered country by means of the Kansas Pacific, the Leavenworth, Lawrence, and Galveston, the Lawrence and Southwestern, the Kansas Midland, and the St. Louis, Lawrence, and Denver railroads. The principal manufactories are a planing mill, a machine shop, 7 wagon and carriage factories, 2 agricultural implement factories, 3 grist mills, 2 elevators, 2 breweries, 4 packing houses, a tannery, a soap factory, a woollen factory, a pottery, 3 furniture factories, and 2 mineral water factories, all operated by steam or wind power. A substantial dam has been erected across the Kansas river at this point, capable of furnishing 1,500 horse power for manufacturing purposes. There are two national banks with a capital of \$200,000, a state bank with \$50,000, and a savings bank with \$100,000. There are graded public schools, including a high school department, and attended by about 1,200 pupils, and a library association possessing 3,500 volumes. Three daily, two tri-weekly, and five weekly (one German) newspapers are published. There are 25 churches.—Lawrence was founded in 1854 by settlers from the eastern states under the auspices of the New England emigrant aid society, and became the headquarters of the anti-slavery settlers in the ensuing struggle with the advocates of slavery in Kansas. On Aug. 25, 1863, it was surprised by a band of about 350 confederate guerillas under Quantrell, who killed 145 of the inhabitants, and burned about 200 houses, comprising the greater part of the city.

**LAWRENCE. I. Amos**, an American merchant, born in Groton, Mass., April 22, 1786, died in Boston, Dec. 31, 1852. In 1799 he became a clerk in a country store in Dunstable, and soon afterward in Groton. In April, 1807, he went to Boston, and upon the failure of his employers there, he commenced business upon his own account in December, 1807, as a dry-goods merchant. On Jan. 1, 1814, he entered into a partnership with his brother Abbott, who for the previous five years had been his chief clerk, which continued uninterruptedly until the death of Amos. The business operations of the firm were conducted with great success, and

both brothers aided in the establishment of manufactures in New England, thereby largely adding to their fortunes. The naturally benevolent disposition of Amos gradually led him to resist the demands which his business imposed upon his time and inclinations; and when, after a serious illness in 1831, he was compelled to retire permanently from active participation in the affairs of his firm, he devoted the remaining years of his life to acts of beneficence. From the beginning of the year 1829 till his death he expended, according to his books, \$639,000 for charitable purposes. Nearly five sixths of this amount were given during the last 11 years of his life. Among the public objects of his bounty were Williams college, to which he gave nearly \$40,000; the academy in Groton, now called the Lawrence academy, on which he expended at different times \$20,000; Wabash college, Kenyon college, the theological seminary at Bangor, Me., and several others. Books he distributed in whole libraries, sending collections to many literary institutions and deserving persons. He established and for some time maintained a child's infirmary in Boston, and gave \$10,000 for the completion of the monument on Bunker hill. His private benefactions were almost innumerable, and several rooms in his house were used as the receptacles of articles for distribution.—See "Extracts from the Diary and Correspondence of the late Amos Lawrence, with a Brief Account of some Incidents in his Life; edited by his son, William R. Lawrence, M. D." (Boston, 1855). **II. Abbott**, an American merchant, brother of the preceding, born in Groton, Mass., Dec. 16, 1792, died in Boston, Aug. 18, 1855. In his 16th year he was bound an apprentice to his brother Amos in Boston, and in 1814 he became one of the firm of A. and A. Lawrence, which for many years conducted a prosperous business in the sale of foreign cotton and woollen goods on commission. Subsequent to 1830 they were largely interested as selling agents in the manufacturing companies of Lowell, and in the latter part of his life Abbott Lawrence participated extensively in the China trade. In 1834 he was elected a representative in congress, and was appointed a member of the committee on ways and means. He declined an election to the next congress, but served for a brief period in 1839-'40. In 1842 he was appointed a commissioner on the part of Massachusetts on the subject of the northeastern boundary. He took an active part in the presidential canvass of 1844 as a supporter of Mr. Clay, as he had done four years previous in the election of Gen. Harrison; and in the whig national convention of 1848 he was a prominent candidate for vice president, lacking but six votes of a nomination. In 1849 President Taylor offered him a seat in the cabinet, which he declined; but he accepted the post of minister to Great Britain, which he occupied with credit until October, 1852, when he was re-

called at his own request. The remainder of his life was devoted to his private business. In 1847 he gave to Harvard university \$50,000 to found the scientific school, bearing his name, connected with that institution; and he bequeathed a like sum in aid of the same object. He also left \$50,000 for the erection of model lodging houses, the income to be for ever applied to certain public charities.—See Hunt's "Lives of American Merchants," vol. ii.

**LAWRENCE. I. Sir Henry Montgomery**, a British soldier, born in Matura, Ceylon, June 28, 1806, died in Lucknow, July 4, 1857. He studied in the military college at Addiscombe, obtained a cadetship in the Bengal artillery in 1821, served in the Afghan campaign in 1843, and in the same year, having then reached the rank of major, was appointed British resident at Katmandu. He distinguished himself in the Sutlej campaigns, and from 1846 to 1849 was agent for the governor general on the N. W. frontier and resident at Lahore. He was next appointed chief of the board of administration in the Punjab, and received the commission of colonel. From 1852 to 1857 he was agent of the governor general in Rajpootana. Although ill health demanded his return to England, he consented at the request of the Indian government to assume the chief commissionership of Oude, and arrived at Lucknow in March, just before the commencement of the mutiny. When the first disturbances occurred he demanded and obtained full powers as chief military commander in Oude, receiving at the same time a commission as brigadier general, and the memorable defence of the residency was made under his direction up to the time of his death. He was mortally wounded by a shell July 2, and died at the residency two days afterward. He was the author of "Adventures of an Officer in Runjeet Singh's Service," and of various military and political essays, originally published in the "Calcutta Review," which were collected and reprinted in London in 1859. His life has been written by Maj. Gen. Sir H. B. Edwardes and Herman Merivale (London, 1872). **II. John Laird Mair**, lord, brother of the preceding, born in Richmond, Yorkshire, March 4, 1811. He went to India in 1829 as a cadet in the Bengal civil service, passed through various subordinate stations, and was magistrate successively at Delhi, Paniput, and Goorgaon. About 1845 he was appointed judge, magistrate, and collector in the central district of Bengal, whence he was transferred in 1846 to the chief commissionership of the newly annexed provinces beyond the Sutlej. In 1852 he was appointed chief commissioner of the Punjab. He was still at the head of affairs in that country when the mutiny broke out in 1857, and owing to his prompt and judicious measures the Punjab was one of the few parts of Bengal in which the rebellion never succeeded. He was created a baronet Aug. 16, 1858. In the same year he returned home, where he was made a mem-

ber of the privy council, and received from the court of directors a life pension of £2,000. At the end of 1863 he was appointed viceroy of India. He retired in 1863, and was created a baron, April 4, 1869. In 1870 he was elected a member of the London school board, and chosen chairman.

**LAWRENCE, James**, an American naval officer, born in Burlington, N. J., Oct. 1, 1781, died of wounds received in action, June 5, 1813. He entered the navy as a midshipman Sept. 4, 1798; in 1800 he was made acting lieutenant, and in April, 1802, a lieutenant, and served with distinction during the war with Tripoli, being one of the party which destroyed the frigate Philadelphia, Feb. 15, 1804. In February, 1805, he returned to the United States, but soon sailed for the Mediterranean again, in command of a gunboat. Soon after his arrival on the station peace was concluded, and he returned to the United States. He served as first lieutenant of the Constitution in 1808, and subsequently commanded the Vixen, Wasp, and Argus. On Nov. 3, 1810, he was promoted to the rank of master commandant, and appointed to the Hornet (18 guns), with which in the autumn of 1812 he sailed from Boston in company with the frigate Constitution, Com. Bainbridge's flag ship. In December the two ships arrived off the port of San Salvador, Brazil, where the British sloop of war Bonne Citoyenne was lying, with a very large amount of specie on board. Soon afterward the Constitution separated from the Hornet, leaving her to blockade the Bonne Citoyenne, which she did for 18 days, when she was chased off by the Montague (74), and shaped her course for the mouth of the Demerara river, making several captures on the passage. On Feb. 24, 1813, when off the mouth of the river, the Hornet fell in with the British brig Peacock, a vessel of equal size but somewhat lighter armament. After a short but severe contest the Peacock surrendered. She was found to be in a sinking condition, and before all the wounded could be removed went down with nine of her own and five of the Hornet's men. The loss of the Peacock was 33 killed and wounded, including her commander; the Hornet had but one killed and two wounded, and the ship was but little injured. She arrived at New York in March with 277 souls on board, including prisoners. Congress bestowed a gold medal upon Lawrence, and a silver one upon each commissioned officer who served under him in this engagement. In the same month Lawrence was promoted to the rank of captain, and appointed to the frigate Chesapeake, then lying at Boston. The Hornet was also placed under his orders, and it was intended that the two ships should cruise against the Greenland whale fishery. In the forenoon of June 1 the Chesapeake was lying in President roads ready for sea, and the British ship Shannon (38), Capt. P. V. Broke, appeared alone in the offing, for the express purpose of meeting her.

Capt. Lawrence felt himself impelled under these circumstances to go out and engage the Shannon, though doubtless against his better judgment. The ships were very nearly of equal force, both mounting 48 guns, long 18- and 32-lb. carronades, and their complements were probably about the same. But the Shannon was a thoroughly disciplined ship, and Capt. Broke, who had for some time contemplated meeting the Chesapeake, had been cruising and constantly exercising his ship's company, with a view to this engagement. The Chesapeake, on the other hand, had arrived at Boston two months before from a cruise, and the men had been much on shore, indulging freely in dissipation. Capt. Lawrence was almost a stranger to them, and was weak in officers. At noon the Chesapeake weighed and stood out with a moderate breeze at S. W. At 5h. 45m., when the two ships were about 30 m. from Boston light, the action was commenced by the Shannon, which opened her fire as her guns bore, the Chesapeake retaining hers until the ships were fairly yardarm and yardarm, when she fired a well directed broadside. For several minutes a severe cannonade was maintained by both ships, when the rigging of the Chesapeake was so much cut that she became unmanageable, was thrown into the wind, taken aback, and fell aboard the Shannon, the waist anchor of the latter hooking her rigging. She was now exposed to a destructive raking fire, her upper deck particularly being swept by grape and canister from the carronades of her antagonist. Boarders were ordered to be called, but the bugleman had left his post. This caused some confusion, and at this critical moment Lawrence fell with a second and mortal wound, being shot through the body. The upper deck was now left without a single commissioned officer, the others having been all killed or wounded, and the Shannon boarded and carried the ship, no regular resistance being made. This sanguinary action lasted but 15 minutes. The Chesapeake had 43 killed and 98 wounded. The Shannon had 23 killed and 56 wounded, Capt. Broke among the latter. Both ships now made sail for Halifax. Lawrence survived four days, and every respect was paid by the British officers at Halifax to his remains, and those of the first lieutenant Ludlow. Few officers enjoyed a higher professional or private reputation than Capt. Lawrence. His personal appearance was dignified and commanding. In action he evinced the utmost courage, and his last injunction as he was borne below, mortally wounded, was: "Don't give up the ship."

**LAWRENCE, Saint**, born in Rome about the beginning of the 3d century, martyred under the emperor Valerian, Aug. 10, 258. He was one of the seven archdeacons of Rome under the pontificate of Sixtus I., and had the care of the church treasury and of the poor widows and orphans. He was summoned before the prætor and ordered to surrender the treasures of the church, whereupon he brought forward

the poor and the sick under his care, and declared that they were his treasures. For persisting in his refusal to give up his charge to the Roman prefect, he was scourged and then broiled to death on a large gridiron. His heroism under the torture is said to have caused the conversion of several pagans. A church was built over his remains outside the city walls in the reign of Constantine the Great.

**LAWRENCE, Sir Thomas**, an English painter, born in Bristol, May 4, 1769, died in London, Jan. 7, 1830. While a child he drew likenesses with the pen and pencil, and when only six years old took portraits in profile of Lord and Lady Kenyon. At this time his father was the landlord of the Black Bear inn at Devizes, a fashionable resort of travellers to Bath, and the personal beauty and genius of young Lawrence were wont to excite the admiration of the guests. After a very imperfect education he began to paint, and at 10 years of age attempted such ambitious and difficult subjects as Peter denying Christ, Haman and Mordecai, and the like. In 1782 his father removed to Bath, and placed him under the instruction of Hoare, the crayon artist. Here also he found abundant employment for his pencil in executing half-guinea likenesses of visitors to the wells, thereby acquiring a mastery over the details of costume. At the age of 13 he received from the society of arts the great silver pallet, with an additional present of five guineas, for a copy in crayon of the "Transfiguration." In 1787 he removed with his father to London, exhibited in Somerset house the same year, and almost immediately became the fashionable portrait painter of the day, a preëminence which he maintained for more than 40 years. In 1791 he was chosen a "supplemental associate" of the royal academy, his age not permitting him to become a candidate for associate membership (the only instance on record in which such an honor has been bestowed), and in the succeeding year was appointed by George III. to succeed Sir Joshua Reynolds as his principal painter in ordinary. During the next 20 years commissions for portraits flowed in upon him in such abundance that he was obliged to resign all attempts at historical composition, in which he had given some youthful promise. He was generally considered the first portrait painter of the time, and the members of the royal family and almost all persons distinguished in the fashionable world, or in literature, art, science, or the learned professions, were numbered among his sitters. His portraits of beautiful women and children were particularly celebrated. While at the height of his fame he was commissioned by the prince regent to paint the portraits of the sovereigns, statesmen, and generals who had participated in the overthrow of Napoleon, in the performance of which duty he visited the congress of Aix-la-Chapelle, and thence went to Vienna and to Rome, where he painted the pope. This series of portraits, which is of unequal merit,

is deposited in Waterloo hall at Windsor. In 1820, during his absence on the continent, he was elected president of the royal academy, as successor of Benjamin West. He had some years previous received the honor of knighthood. His reputation has not wholly survived him, as, notwithstanding his facility in expressing individual character, he was inclined to an over-refinement of gracefulness, and his portraits sometimes degenerated into a mannered insipidity. His personal character was in every respect engaging, and he was universally beloved for his amiability and generosity. Although he received large sums for his portraits, his income amounting to from £10,000 to £15,000 a year, his liberal style of living and frequent pecuniary aid to brother artists prevented him from becoming a rich man. His "Life and Correspondence," by D. E. Williams, appeared in 1831. A collection of engravings from his choicest works, with biographical and critical notices, was published in London in 1845 (royal folio, 50 plates).

**LAWRENCE, Sir William**, an English surgeon, born at Cirencester, July 16, 1783, died in London, July 5, 1867. He received a classical education, and in 1799 was apprenticed to Abernethy. He became surgeon at St. Bartholomew's hospital and in other institutions, professor of anatomy in the royal college, sergeant surgeon to the queen, and a fellow of the royal society. His principal works relate to hernia and to venereal diseases of the eye.

**LAWRENCE, William Beach**, an American jurist, born in New York, Oct. 23, 1800. He graduated at Columbia college in 1818, studied law, went to Europe in 1821, and on his return to New York in 1823 was admitted to the bar. In 1826 he was secretary of legation in London, and in 1827-'8 chargé d'affaires. He then went to Paris, where he translated into English Marbois's history of the treaty of Louisiana, with an introduction and notes (Philadelphia, 1830). On his return he delivered a course of lectures on political economy to the senior class of Columbia college, which were published in 1832. He took a prominent position at the bar of New York, and actively promoted the construction of the Erie railway, being a member of the executive committee. In 1850 he removed to Ochre Point, near Newport, R. I. In 1851 he was elected lieutenant governor, and soon after became acting governor of the state; and in 1853 he was a member of the state constitutional convention. During his term as governor he exerted himself to procure the abolition of imprisonment for debt, and was instrumental in defeating the passage by the legislature of the Maine liquor law. In 1855 he published a new edition of Wheaton's "Elements of International Law," with annotations and a notice of the author, a work which he undertook on the death of Mr. Wheaton in 1848 for the benefit of the author's family, and another edition in 1863. In October, 1869, he was a member of the social

science congress held in Bristol, Eng. In 1872-'3 he delivered a course of lectures on international law before the law school of Columbian college, Washington. His more important publications include "History of the Negotiations in reference to the Eastern and Northeastern Boundaries of the United States" (New York, 1841); "The Law of Charitable Uses" (1845); "Visitation and Search" (1858); *Commentaire sur les éléments du droit international*, &c. (3 vols., Leipsic, 1868-'73); *Étude de droit international sur le mariage* (Ghent, 1870); "The Treaty of Washington" (Providence, 1871); "Disabilities of American Women Married Abroad" (New York, 1871); "The Indirect Claims of the United States under the Treaty of Washington of May 8, 1871, as submitted to the Tribunal of Arbitration at Geneva" (Providence, 1872); "Belligerent and Sovereign Rights as regards Neutrals during the War of Secession," an argument on the case of the Circassian before the mixed commission on British and American claims, under the 12th article of the treaty of Washington (Boston, 1873); "Administration of Equity Jurisprudence" (Boston, 1874); and several speeches and addresses.

**LAWRENCEBURG**, a city and the capital of Dearborn co., Indiana, situated in the S. E. corner of the state, on the Ohio river, 22 m. below Cincinnati, and 82 m. S. E. of Indianapolis; pop. in 1870, 3,159. It is the terminus of the Whitewater canal, and the point of junction of the Ohio and Mississippi and the Indianapolis, Cincinnati, and Lafayette railroads. It contains a foundery, two flour mills, two furniture factories, breweries and distilleries, three national banks, a court house, graded public schools, two weekly newspapers, and seven churches.

**LAWSON, L. M.**, an American physician, born in Nicholas co., Ky., Sept. 10, 1812; died in Cincinnati, Jan. 21, 1864. His father was a pioneer Methodist minister who had emigrated from Virginia. He graduated in 1837 at Transylvania university, where in 1843 he became professor of general and pathological anatomy and physiology. In 1847 he became professor of materia medica and general pathology in the Ohio medical college, and in 1852 professor of the principles and practice of medicine and clinical medicine. In 1854 he was appointed to the chair of theory and practice of medicine and clinical medicine in the Kentucky school of medicine at Louisville. In 1857 he returned to the medical college of Ohio as professor of the theory and practice of medicine. In 1860 he filled the chair of clinical medicine in the university of Louisiana at New Orleans; and in 1861 he again returned to the medical college of Ohio, where he remained until his death. He conducted the "Western Lancet" from 1842 to 1864. In 1844 he edited an edition of Hope's "Morbid Anatomy." His chief fame rests upon his "Practical Treatise on Phthisis Pulmonalis" (Cincinnati, 1861).

**LAWSON, John**, an American surveyor and historian, of Scottish birth. He began his surveys in 1700, but fell a victim to the jealousy of the Indians, who confounded the surveyor of their territory with those who despoiled them of it. He was captured by them while exploring North Carolina in 1712, when in company with De Graffenried, a Swiss who contemplated colonization. The latter was permitted to buy himself free, but Lawson was burned at the stake. He left one of the most valuable of the early histories of the Carolinas, entitled "A New Voyage to Carolina, containing the Exact Description and Natural History of that Country, together with the Present State thereof; and a Journal of a Thousand Miles Travelled through Several Nations of Indians, giving a Particular Account of their Customs, Manners, &c." (London, 1709). The volume is a quarto of 258 pages, well illustrated with one of the best maps of the time, and with various other engravings, chiefly in natural history. The original edition is now very rare; it was reprinted at Raleigh in 1860 (12mo).

**LAWYER**, one whose profession is to give advice and assistance in legal matters, and to prosecute and defend in the courts the causes of those who may employ him for the purpose. The designation comprehends the several classes known as attorneys, solicitors, proctors, counsellors, barristers, sergeants, and advocates, who with various privileges and in different capacities give aid in expounding, applying, or enforcing the law, or in the preparation of legal documents. In barbarous countries or under a despotism there could be little occasion for lawyers, and indeed they would scarcely be tolerated; but in civilized countries, where justice is administered in accordance with rules previously promulgated, the employment of persons familiar with these rules to assist in legal controversies those who were not, would be so natural a proceeding, that the establishment of such a practice would be anticipated as quite a matter of course. And such we find to have been the case, though the persons rendering such assistance have not always been set apart as a distinct profession, nor have they always made their legal services a means of support. In Rome the patrician was expected to assist and protect his clients and dependents by his advice, and also when needful by open pleading of their causes before the tribunals; but this soon degenerated into a practice of hiring the aid, as advocates, of such patrons as by their oratory or their social position were specially influential. Many attempts were made by law to put a stop to the feeing of advocates, but without success; and at length lawyers became a recognized class, and the opinions or responses of the most eminent of them on questions arising under the customary law were accepted as authority. (See CIVIL LAW.) In modern times lawyers have generally been

divided into two classes: 1, those who draft legal documents, institute suits, bring them to an issue by proper pleadings, and prepare them for trial; and 2, those who give counsel in legal matters, and take charge as advocates of the causes which the other class have prepared for trial. The second class is regarded as superior to the other in dignity and importance. In England and Ireland the lower class are known as attorneys when their practice is in the courts of common law, solicitors when it is in chancery, and proctors in the admiralty and ecclesiastical courts. They must be regularly admitted to practice by the courts upon an examination regarding their fitness, and are entitled to a compensation for their services from those who employ them. This compensation is according to a fee bill prescribed by law. The present requisite for an examination for admission as an attorney or solicitor is that the applicant shall have served an apprenticeship of five years with a practitioner, but this may be diminished two years if he has received a degree at one of the English universities or the university of Dublin. The second class are counsellors or advocates, and come to the bar through the inns of court. (See INNS OF COURT.) They are first called barristers, but after 16 years' admission may be advanced to the degree of sergeant. From the sergeants the higher judicial officers of the realm are chosen, and the attorney and solicitor general; and it is customary also to confer the title of queen's counsel upon eminent sergeants, who by accepting it are understood to be so far retained in behalf of the crown as not to be at liberty to take employment against it without special license. An advocate makes no stipulation for compensation, but is nevertheless expected to perform no services until a fee is paid; and when a brief is sent him in a cause, the retainer accompanies it. In the recent union of all the courts of England in one supreme court, the practitioners in all the courts are made practitioners in the supreme court. Lawyers in Scotland are known as writers, solicitors, and advocates. The last named are admitted by the faculty of advocates, and may practise in all the courts and in the house of lords. Writers to the signet are a class of attorneys having some special privileges. On the continent, as in England, lawyers are divided into two classes, the higher of which embraces the advocates, and the lower perform the duties corresponding to those of attorneys. In France the practitioners in each court form a society or college, to which admission can only be obtained by their assent; and the same is the case in other countries where the *Code Napoléon* was introduced.—In the United States, each state has its own rules regarding the legal profession; but certain remarks may be made which will be of general application. No person is at liberty to hold himself out as a practitioner of the law without being duly licensed as such by some proper court. A license granted

by the highest court in the state gives authority to practise in all the courts. In some states inferior courts are permitted to grant licenses of like effect, but generally their jurisdiction in this regard is limited to granting admissions to practice in their own courts. In most of the states, perhaps in all, any one may manage his own case in person, and in some he may by special deputation empower any one, whether admitted to the bar or not, to act for him. The English designations of attorney, solicitor, proctor, and counsellor are nominally retained, but with no corresponding division of privileges and duties between the counsellor and the others; and if in any of the states any distinction exists between an attorney and a counsellor, the latter is only an attorney who becomes counsellor, or entitled to admission as such, by virtue of his practice for a certain period of time. In most of the states, to entitle one to apply for admission to the higher courts, he must present certificates showing that he has pursued the study of the law for a prescribed period in the office of a practising attorney or in a law school; and he is then examined as to his legal attainments either in open court or by a committee of the bar, and only admitted if the examination proves satisfactory. In some states applicants are entitled to examination for admission without making any showing as regards previous studies. Practitioners in the highest courts of the several states are admitted to practice in the federal courts on motion, without examination. In courts not of record, license to practise is not required. The wig and gown which are always worn by the judges of the superior courts and the advocates in England when in the discharge of their duties, are not made use of in this country, with the single exception that the gown is worn by the judges of the federal supreme court. Lawyers, by virtue of their admission to practice, are entitled to certain privileges and subject to certain restrictions. 1. They are officers of the court in which they are admitted to practice, and are subject to summary trial and punishment as such for any misconduct in suits or proceedings therein. Their license to practise may also be revoked for specific misconduct in suits, or even for other misconduct, if of a character rendering them unfit to be intrusted with their responsible office. 2. They are exempt from service on juries, and also from arrest on civil process during their attendance upon court engaged in or awaiting the trial of causes. 3. In the United States attorneys and counsel alike are entitled to a compensation for their services, which in the absence of specific agreement as to amount will be such as evidence may establish to be reasonable. Formerly they were not allowed to engage in suits for a share of the money or profits that should be recovered in the event of success, and an agreement to that effect would now be held illegal at the common law in some of the states, while in others it seems admissi-

ble under the statutes, and in still others it is doubtful what the rule would be held to be. But reputable attorneys seldom make such contracts, and they are generally regarded as unprofessional. Fee bills, whether by statute or rule of court, are now almost unknown in the United States, except as regulating the recovery of the successful party from his opponent. 4. The relation of attorney and client is regarded as confidential. The attorney cannot as a witness be compelled to disclose any communication his client may have made to him in order to obtain his advice or assistance; and as this exemption is for the client's benefit and protection, the attorney will not even be permitted to disclose, if willing to do so, unless the client assents. But this privilege would not extend to matters foreign to the client's own business, nor to any disclosure of intended misconduct, such for instance as confiding to counsel the purpose to commit a crime; in other words, it would not extend to anything not within the reason of the privilege, which is to throw the protection of secrecy over all communications between client and attorney which are necessary or proper to put the latter in possession of the facts to enable him to give the former intelligent advice regarding his legal rights and liabilities. While the relation exists the law regards with some degree of suspicion any other dealings of the attorney with the client, and contracts between them may be set aside on the application of the client if they appear to be one-sided or unfair, on the presumption that the attorney's influence growing out of the relation has been improperly employed to obtain them.—Of the ethics of the legal profession but little can be said in this place. By the large majority of the profession a high standard is sought to be maintained, and city, county, and sometimes state societies are formed having this object chiefly in view. In the lower courts, however, a class of practitioners is met with who rely for their success upon pettifogging practices and trickery, some of whom solicit business, and especially the defence of persons accused of crime, with little or no intention to perform valuable service in return. This last class are often called "shysters." And it is not to be disguised that men of eminent ability are sometimes met with at the bar who are as unscrupulous in their practice in the higher courts as are the pettifoggers and shysters in the lower. In this country it is always understood that certain officers will be members of the legal profession, such as judges of the higher courts, masters in chancery, or commissioners performing corresponding duties, attorneys general of states, public prosecutors of counties, and the like; and it is sometimes provided by law that no other persons shall be eligible.—Until recently women have not been admitted to practice as lawyers. An application for admission in Illinois having been denied on the ground that the statutes on the subject em-

braced males only, an appeal was taken to the supreme court of the United States, where the position was taken by counsel that the decision was in conflict with the new amendments to the federal constitution. This position, however, was declared untenable by that court. Afterward a statute was passed in Illinois which permitted women to be licensed to practise, and by statute or decision of courts they may be admitted in several of the other states. Very few, however, have hitherto availed themselves of the permission. The court of claims has recently decided that women are not entitled to practise in that court.

**LAYARD, Austen Henry**, an English archæologist, born in Paris, during the temporary residence of his parents in that city, March 8, 1817. He is descended from a Huguenot family which emigrated from France after the revocation of the edict of Nantes. After spending a number of years in Florence, where he cultivated a taste for drawing, he commenced the study of law in England, but soon abandoned it to embark in a tour of exploration in the East. Leaving England in 1839, he traversed Albania and Roumelia; and after a brief residence in Constantinople he proceeded through Asia Minor to Syria, "scarcely leaving untraced one spot hallowed by tradition, or unvisited one ruin consecrated by history." Thence he went to Persia, and devoted some time to an examination of the remains of Susa, though without any important results. During this period he mastered the Arabic and some other oriental idioms, and so assimilated his habits, dress, and general appearance to those of the Arabs, that he was frequently taken for one of that race. Passing through Mosul in 1842 on his return to Constantinople, he found that M. Botta, the French consul at the former place, was making excavations, under the direction of his government, in the neighboring mound of Kuyunjik; and he accordingly directed the attention of this gentleman to the great mound of Nimrud, about 30 m. below Mosul by the Tigris, as likely to contain remains of the utmost interest to the archæologist. The distance of the place, however, and its inconvenient position, prevented M. Botta from availing himself of this suggestion, and circumstances detained Mr. Layard in Constantinople and its neighborhood for several years. He however strongly cherished the hope of exploring the Assyrian ruins around Mosul, which he had cursorily examined while passing down the Tigris in 1840; and the gratifying results of M. Botta's excavations at Khorsabad in 1843-'4 increased his anxiety to revisit the great mound of Nimrud. Sir Stratford Canning, the British ambassador in Constantinople, agreed to defray for a limited period the expense of excavations in Assyria, and Layard eagerly embraced the opportunity. Arriving in Mosul in November, 1845, he broke ground in the great mound of Nimrud on the 9th of that month; and from that period until April, 1847, with the excep-

tion of partial explorations at Koyunjik, opposite Mosul, and Kalah (or Kileh) Shergat, and occasional excursions into the adjacent regions, he prosecuted his labors assiduously at that place, bringing to light sculptures, bass-reliefs, hieroglyphics, specimens of glass and pottery, and other monuments of Assyrian civilization. His excavations were not pursued without considerable difficulty, caused by the superstition and intractable character of his Arab workmen, and the petty persecutions of the pasha of Mosul, from which he was finally relieved by a firman from the sultan authorizing him to remove the sculptures. During the progress of the excavations, through the interest of Sir Stratford Canning, the British museum advanced a small fund in aid of the undertaking; and in 1847 a number of cases of antiquities, including the colossal human-headed lions and bulls and the Nimrud obelisk, which had been floated down the Tigris to Bagdad, and there placed on shipboard, were received in England, and deposited in the Assyrian transept of the British museum. In the same year Mr. Layard returned home, and prepared his "Nineveh and its Remains" (2 vols. 8vo, 1849), accompanied by two folio volumes of illustrations and a volume of inscriptions in the cuneiform character. In 1848 he returned to Constantinople as attaché to the embassy there; and in the latter part of 1849, at the invitation of the trustees of the British museum and under their direction, he resumed the excavations at Nimrud, which were carried on for about a year, after which he transferred the scene of his labors to Babylon. The excavations at this place produced no important result; but the discoveries at Nimrud, particularly the tablets containing Ninevitic records, were of great value. Returning to England, he published the results of his second expedition, under the title of "Discoveries among the Ruins of Nineveh and Babylon, with Travels in Armenia, Kurdistan, and the Desert" (2 vols. 8vo, 1853). Upon the retirement of Lord Palmerston from the foreign office in 1851, Mr. Layard was appointed under secretary of state for foreign affairs, and soon after entered parliament as member for Aylesbury. He declined appointments under the succeeding administrations, preferring to give his attention chiefly to questions of eastern politics, and soon attracted attention in the house of commons as a debater. In 1854 he visited the Crimea, and was subsequently instrumental in procuring the appointment of the committee of inquiry into the state of the British army before Sebastopol. He declined office under the Palmerston administration of 1855, and became a member of the "Administrative Reform Association." His motion embodying the views of this organization was rejected in the house of commons in June, 1855, by a decisive vote. At the general election of 1857 he was defeated at Aylesbury, and in 1859 at York, but was elected for Southwark in 1860. He

devoted himself for some years to the preservation of the frescoes and paintings of the early Italian masters. Of these he made a series of elaborate drawings and tracings, a portion of which have appeared in the publications of the "Arundel Society." He became again under-secretary of state for foreign affairs in 1861, and retired from the office on the fall of Russell's second administration in 1866. Mr. Gladstone appointed him chief commissioner of works in 1868, and in 1869 minister plenipotentiary at Madrid, a post which he still holds (1874).

**LAYBACH**, or **Laibach**, a town of Austria, capital of the duchy of Carniola, situated on the river Laybach, near its entrance into the Save, 45 m. N. E. of Trieste, on the railway from Vienna; pop. in 1870, 23,032. The town occupies both banks of the river, which is here crossed by five bridges. Among the most remarkable buildings are the palace of Prince Auersperg, the town hall, the theatre, and the barracks. The former fortified castle on the Schlossberg, which was destroyed in 1813, has since been used as a provincial penitentiary, and now serves as a military depot and prison. The city has 11 Catholic churches, several monasteries, a Protestant church, two gymnasia, a *Realschule*, a veterinary school, a provincial museum, manufactories of linen, woollen, and silk, a large sugar refinery, and oil, paper, and cotton mills. Laybach is a place of great antiquity, the seat of a bishop, of the civil and military government of the province, and of a chamber of commerce and industry. From 1809 to 1813 it was the seat of the French government of the Illyrian provinces. A congress of European monarchs was held here in 1821 to regulate the affairs of Italy.

**LAYERING**, one of the processes in horticulture by which plants are multiplied. In the propagation of plants by cuttings, a portion of the stem is removed and inserted in the soil, where it takes root and becomes a new plant; in layering, the portion of the stem which is to form the new plant remains attached to the parent plant while the roots are forming. In the cutting there is sufficient nutriment accumulated within its stem and leaves to enable it to throw out roots, through which it can derive sustenance; but in the layer the portion that is to become a new plant is sustained by the old one until it is provided with the means (roots) of self-support. Many plants which it is almost impossible to propagate by cuttings are readily managed by layers. The operation of layering was no doubt suggested by the manner in which some plants multiply themselves in the wild state; many, as the red raspberry and blackberry, throw out stems just below the surface of the earth; these run along underground, sometimes for several feet, when the end turns up and seeks the light; abundant roots are formed, and when the connection with the old plant is severed by decay or otherwise, the new one grows on and in time

repeats the same process. This propagation by suckers, as it is called, is illustrated in fig. 1. In close imitation of this, the gardener selects a branch which starts above ground,

FIG. 1.—Propagation by Suckers.

and bends it down so that a portion can be buried in the soil; roots are soon thrown off by that part of the stem covered by the earth, and when these are sufficiently developed the communication with the parent is cut off. Many plants, the stems of which strike root easily, such as the wistaria and the grape, may be easily multiplied by this simple process. Other subjects are more difficult, and require special treatment. One of the common methods is to form a "tongue" on the buried-stem by cutting halfway through it in a sloping direction; the old practice was to cut the tongue on the under

FIG. 2.—Tongue Layering.

side of the branch, but it is much better to cut it upon the upper side, as shown in fig. 2. If measures are not taken to keep this tongue open, the wound will sometimes heal, and no roots be formed; hence a sliver of wood or other matter is put in to keep the cut open; or if the nature of the plant will allow, a slight turn of the stem will separate the parts. In this method the uninjured portion of the stem serves to keep the extremity alive while roots form. The end of the stem is usually turned up and held in an erect position by tying it to a stake. Some plants thus treated will form roots in a few weeks, while others require the whole season, or even

longer, before the new plant may be removed. This kind of layering is practised on herbaceous stems (as the carnation), or upon woody stems two or more years old. Shoots of the grape of the current season, if layered as soon as the wood has become firm enough to handle, will form good plants by autumn. Very flexible vines are treated by what is called serpentine layering, in which successive portions are put below ground, alternating with other portions exposed to the air. In very moist summers florists resort to what is called "layering in the air" for the propagation of geraniums (pelargoniums); in such seasons the stems of these plants are so succulent that cuttings made in the usual way would decay before they took root; in this case the stems are tongued as if they were to be layered, but are left without contact with the soil; the cutting checks the luxuriant growth, causes the soft wood to harden, and in some seasons the cut surface will not only be calloused but even emit aërial roots. Among the modifications of layering is one employed when the stem cannot be made to reach the earth, but the

FIG. 3.—Mound Layering.

earth must be brought to the stem; a pot with a slit in the side is made to include the stem and then filled with earth; some contrivance is supplied for keeping the earth in the pot in a properly moist condition, and when sufficiently rooted the layer is detached. Mound or stool layering is largely practised by nurserymen to procure quince stocks for dwarfing the pear, and paradise and doucin stocks for dwarfing the apple. The plants when well established are in early spring cut off near the surface of the ground; numerous shoots spring from the remaining portion of the stem, which are allowed to grow during the season; in the following autumn or spring earth is heaped up around the plant so as to cover the base of these shoots for three or more inches with good soil, and this shaped to form a neat mound as shown in fig. 3; the buried bases of the shoots throw out roots into the soil of the mound, and in autumn the earth is removed, the rooted shoots severed from the parent plant, or stool as it is called, and set out by themselves; if properly managed, the stools will produce successive crops of stocks.

LAYNEZ, or Lainez, Diego, the second general of the society of Jesus, born at Almazan, Cas-

tile, in 1512, died in Rome, Jan. 19, 1565. He received his master's degree in the university of Alcalá in 1533, and in the same year went to Paris for the double purpose of completing his theological studies and of forming the acquaintance of Ignatius Loyola. (See *Jesuits*.) He was ordained priest in Venice, June 24, 1537, and in the following November was appointed by Paul III. to teach scholastic theology in the Sapienza college in Rome. He was afterward employed in a series of reformatory missions destined to check in upper Italy the spread of Protestant doctrines, and to revive faith and piety among the clergy and people. One of the results of his labors there was the foundation in 1542 of a Jesuit college in Padua. He appeared at the council of Trent in May, 1546, as one of the pope's theologians, opening and closing in this capacity every public discussion, and recapitulating the arguments on both sides. He labored during 1548 in reforming various dioceses in Sicily, founding schools, hospitals for the sick, and retreats for the aged and unprotected, as well as the college of Palermo. In 1550 he accompanied the Spanish expedition to Tunis, and on his return he was appointed provincial of his order in upper Italy. He opened the debates in the council of Trent, when it reassembled in 1551, and used his best endeavors to secure freedom to the Protestants invited to be present. During repeated attacks of fever from which he suffered, the council suspended its sessions. In punishment of a fault of insubordination which he committed in 1551, he was ordered by Loyola to compose a complete summary of dogmatic theology. The manuscript still exists in Rome, but no one has been able to decipher the writing. After the death of Loyola in 1556, Laynez governed the order as vicar general till 1558, when he was unanimously chosen general. In 1559 twelve of the cardinals had resolved to elect him pope after Paul IV.; but their purpose was frustrated by his flight from Rome. In 1561 he went by order of the pope to the conference of Poissy, and in 1562 he was present again at the council of Trent, where he took a leading part. Laynez was conspicuous for his unwearied zeal in teaching; and he used his great influence in establishing free schools, colleges, and universities, and in extending the missionary enterprises of the Jesuits. He twice declined the dignity of cardinal.—Besides the work on theology already mentioned, he left several manuscript treatises on other subjects, all of which are equally illegible. His life was written in French by Michel d'Esne (Douai, 1597).

**LAZARISTS**, a society of regular clerks founded at Paris in 1625, so called from the priory of St. Lazare, near Paris, their first official residence, but whose proper name is "Priests of the Congregation of the Mission." While St. Vincent de Paul resided as tutor and chaplain with the count de Joigny, father of Cardinal de Retz, he effected much good among

the count's numerous vassals by religious revivals, called missions in the Roman Catholic church. The countess de Joigny, wishing to have a body of such missionaries, obtained from her brother-in-law, Jean François de Gondi, archbishop of Paris, the Collège des Bons Enfants, and induced Vincent with another priest, Antoine Portail, to take possession of it in 1625, for the purpose of founding a congregation of missionary priests. Their enterprise was officially approved by the archbishop of Paris, April 24, 1626; and the missionary society was approved by Urban VIII., Jan. 12, 1632, and Vincent appointed by him its superior. A few days before this last date, Vincent was put in possession of the priory of St. Lazare in the St. Denis suburb, to which a leprosy hospital had been attached in the 12th century, and which had been till then the property of the canons regular of St. Augustine. The new congregation, which only numbered four associates in 1626, had so much increased in 1632 that they were called to labor in almost every diocese of France, and even in foreign countries. They lived together in great poverty and harmony, without being bound by any religious obligation, till Alexander VII. issued a bull confirming their society, April 18, 1655, and in a brief published in the following September regulated their constitution. This prescribes that no one can be admitted into the congregation till he has passed two years of seclusion in one of their seminaries. At the end of this period the candidate binds himself by the simple vows of poverty, chastity, and obedience, and a special vow of ministering to the spiritual needs of the poor. The associates are exempted from the jurisdiction of bishops in the interior of their houses, but dependent on that jurisdiction in diocesan ministrations. Their dress is that of the secular clergy. When the constitutions, with the supplementary rules drawn up by St. Vincent (who had in 1642 been elected by the congregation superior for life), were formally accepted, May 17, 1658, they had already formed establishments and founded missions in every Catholic country of Europe. Beginning in Rome in 1640, their successful labors among the poor of the city, the shepherds of the Campagna, and the peasants of the surrounding provinces, caused them to be called successively to Genoa, Turin, Naples, and Tuscany. Their establishments in the former kingdom of Sardinia were suppressed by the French in 1798; they were restored in 1816, but occupied none of their former houses till 1830. The establishments formed by them after that date in Piedmont and the island of Sardinia continued to prosper till 1870. They were equally prosperous in the kingdom of Naples, where they were compelled to form almost a separate organization in 1788; they reunited with the main body in 1827, and shared the fate of the religious orders in the late political changes in the peninsula. In 1646 eight Lazarists went to Ireland, and labored among the Catholics of

Limerick and Tipperary, but were compelled to withdraw after the capitulation of Limerick. Others from 1651 to 1679 ministered to the spiritual wants of their coreligionists in the Hebrides, Orkneys, and the west coast of Scotland. James II. called them to London at his accession, but they fled the kingdom in 1688. In 1795 they had a principal share in organizing the college of Maynooth, and in 1832 they opened a college in Dublin; and other establishments followed in Ireland, England, and Scotland. They were introduced into Poland in 1651 by Maria Louisa, the French queen of John Casimir; and in 1796 the Lazarist province of Poland, counting the houses dependent on it in the neighboring countries, possessed in all 35 establishments. Suppressed at that time, they were allowed to return to Russian Poland in 1816, and had seven houses there at the breaking out of the last insurrection, none of which now remain. Their six principal houses in the Austrian dominions have not been molested. In 1843 their former residence in Posen was restored to them, and in 1850 they were intrusted with the direction of the theological seminary of Cologne. From these centres they multiplied so rapidly, that they were considered the largest missionary organization in Germany when they were suppressed by the Falk laws in 1872.—Their success in Spain and Portugal and their colonies was chiefly due to the favor of the Portuguese king John V., which enabled them to extend their missionary enterprise throughout the peninsula, as well as to the Azores and to Goa. In Madagascar a Lazarist mission was opened at the French colony of Fort Dauphin, on the E. coast, in 1648. Successive relays of missionaries having succumbed to the climate, excessive hardship, and the treacherous cruelty of the natives, the mission was closed in 1674. In 1783 the Lazarists were substituted for the suppressed Jesuits in the Levantine and Chinese missions. There are now (1874) 16 Lazarist establishments in the Turkish empire, the principal of which are at Constantinople, Alexandria, Smyrna, Damascus, and Beyrout, and two missions at Urumiah and Khosrovah in Persia. To all of these are attached churches, colleges, and schools for both sexes, those for girls being always directed by sisters of charity. In the Chinese empire one of their first missionaries, Pedrini, obtained high rank at court in 1724 through his proficiency in music and mathematics, and the favor of the emperor, who had been his pupil. The controversy with the Jesuits relating to Chinese religious rites prevented the Lazarists in Europe from sending assistance to Pedrini. Those who first succeeded to the Jesuits gained even a higher position than Pedrini; but in 1820 they were involved in a general religious persecution, several of their priests were put to death, and the remainder expelled. They founded, however, a seminary at Macao for training native missionaries, and by this were enabled to estab-

lish similar seminaries in each of the eight provinces which they at present labor to evangelize in China.—In France the Lazarists have enjoyed the double popularity arising from the name of their founder and from their being, like the sisters of charity, a French institution. Before 1789, besides their numerous residences, they directed 49 theological seminaries for the training of the secular clergy. They were suppressed during the revolution, restored by Napoleon in 1804, and a hospital was given them in Paris for the establishment of a central institution and novitiate, together with an annual dotation of 15,000 francs. In 1809 their opposition to the emperor's plans of a national church caused their suppression. They were recalled by Louis XVIII. in 1816, and have continued to prosper, until in 1874 they count 24 houses in France, and two in Algeria.—In South America they owe their first establishment in 1810 to King John VI. of Portugal. They have colleges and theological seminaries at Caraça and Bahia, with residences at Rio de Janeiro, Congonhas, and Santa Catharina. They accompanied a colony of sisters of charity sent from Spain to Mexico in 1844, opened a seminary in the capital, and almost simultaneously were called to Puebla and Leon. In 1859 a residence was given to them in Monterey, and in 1860 in Guadalajara. They are at present excluded, like all ecclesiastics of foreign birth, from the territory of the republic.—The Lazarists came to the United States in 1817 with Bishop Dubourg of New Orleans, and formed successively residences at Barrens, Perry co., Mo., and St. Louis, and a college at Cape Girardeau. They soon obtained establishments in Louisiana, Illinois, Maryland, Pennsylvania, California, and New York. They now (1874) possess 14 establishments in the United States, with colleges in Brooklyn, N. Y., at Suspension Bridge near Niagara, and at Germantown, Pa., which is the central house in this country.—The total number of Lazarists in both hemispheres is at present a little less than 3,000.

**LAZARUS, Moritz**, a German author, of Jewish parentage, born at Filehne, Posen, Sept. 15, 1824. He is the son of a learned rabbi who died in 1874. He studied at the gymnasium of Brunswick, and from 1846 to 1850 at the university of Berlin. From 1860 to 1866 he was professor of psychology in the university of Bern. Returning to Berlin, he became in 1868 teacher of philosophy at the military academy. In 1869 and 1871 he was president of Jewish synods at Leipsic and Angsburg. His works include *Das Leben der Seele in Monographien* (2 vols., Berlin, 1856-'8); *Ueber den Ursprung der Sitten* (1860); *Ueber die Ideen in der Geschichte* (1865); and *Zur Lehre von den Sinnestäuschungen* (1867).

**LAZULITE**. See LAPIS LAZULI.

**LAZZARI, Donato**. See BRAMANTE D'URBINO.

**LAZZARONI** (It. *lazzaro*, a leper), the lowest classes of the populace of Naples, including porters, itinerant vendors of food, boatmen,

beggars, and all without a fixed place of abode. The name is derived from that of the beggar Lazarus mentioned in the parable of Christ. During the middle ages lepers were obliged to wear a peculiar dress, consisting simply of short drawers, shirt, and hood, and down to a recent time this costume was generally retained by the lazzaroni. At the end of the last century their number was estimated at 40,000, most of them sleeping in the open air, in archways, or in large baskets which they carried with them. Though idle, ignorant, and vicious, they are abstemious, frugal, and, when not excited, proverbial for their good nature. They used to elect yearly their chief, the *capo lazzaro*, who was formally acknowledged by the government which was better able to control the lazzaroni through him. The lazzaroni have frequently played an important part in political revolutions. They aided Masaniello in the revolution of 1647, and during the siege of Naples by Championnet in 1799 they fought bravely, their *capo* Michele being afterward appointed a French colonel. In recent times the lazzaroni have generally been identified with the Bourbon interests and reaction; the dread of their being turned loose to pillage the city having been used during the last reigns of the overthrown dynasty as an effectual check on the middle classes. Of late they have lost many of their peculiarities; efforts have been made by the government of Victor Emanuel to inspire them with a love of cleanliness and order; and they are no longer recognized as a separate class, but are enrolled in different districts, and subjected to the same police regulations as other citizens.

LE. See LEH.

LEA. I. Isaac, an American naturalist, born in Wilmington, Del., March 4, 1792. His ancestors followed William Penn from England, and were ministers in the society of Friends. At the age of 15 he was placed with his elder brother, a merchant in Philadelphia, but retained a fondness for natural objects. With Prof. Vanuxem, then a youth, he collected minerals, fossils, &c., and observed the rocks of Pennsylvania. In 1815 both were elected members of the academy of natural sciences of Philadelphia, and Mr. Lea shortly after published his first paper in the "Journal of the Academy," being an account of the minerals which he had observed in the neighborhood of Philadelphia. To a collection of minerals and geological specimens made by his own exertions, those of palæontology and recent shells were added, which at the present time have grown to great magnitude; that of fresh-water shells is entirely unequalled, the family of *unionida* alone consisting of about 9,500 selected specimens of both sexes, all ages and varieties, and of wide geographical distribution. In 1821 he joined the firm of his father-in-law, Mathew Carey, who was engaged in the largest publishing business in the United States. In 1827 he began a series of memoirs

on new forms of fresh-water and land shells, which have been continued to the present time. These were published in the "Transactions of the Philosophical Society," vols. iii. to x., and in the "Journal of the Academy of Natural Sciences," vols. iii. to vi., and separately under the title of "Observations on the Genus *Unio*," &c. (13 vols. 4to, 1827 *et seq.*; the 13th volume being prepared for press in 1873). In 1832 he visited Europe, and in 1833 published "Contributions to Geology," consisting of descriptions of 228 species of tertiary fossils from Alabama, illustrated with great exactness in colors. He retired from business in 1851, and his time has since been devoted to his favorite scientific pursuits. In all he has read 157 original papers to learned societies. In 1852 he made a second visit to Europe, and soon after his return published, in large folio, with colored plates, "Fossil Footmarks in the Red Sandstones of Pottsville," intended to illustrate the remarkable discovery made by himself of saurian footprints in the red sandstone 700 ft. below the conglomerate of the coal formation at Pottsville, and named by him *sauropus primævus*. This discovery was of great interest, as it had been believed until within a few years that no "air-breathing animal" had existed even so low as the coal measures. In another memoir he described the bones and teeth of a saurian from the new red sandstones of Pennsylvania. These constituted the first bones and teeth observed in this formation in the United States, and the animal was named by him *clepsysaurus Pennsylvanicus*. These discoveries were followed by others which have been communicated to the academy of natural sciences. Mr. Lea has contemplated the publication of a large work on the *unionida* of the United States, which is to be a complete monograph of the genera and species of that family. His memoirs published within the last 46 years are preparatory to this object. He was elected a member of the American philosophical society in 1828, and subsequently of the zoological society of London, the Linnæan society of Bordeaux, the imperial society of natural history of Moscow, honorary member of the Asiatic society of Bengal, &c. In December, 1858, he was elected president of the academy of natural sciences of Philadelphia. Among his works, besides those already mentioned, are "Description of a New Genus of the Family Melaniana" (8vo, 1851), and "Synopsis of the Family of Naiades" (4th ed. enlarged, 4to, 1870). II. Thomas Gibson, an American botanist, brother of the preceding, born in Wilmington, Del., Dec. 14, 1785, died in Waynesville, O., Sept. 25, 1844. He was engaged in mercantile affairs until his 43d year, when he retired from business and devoted himself to botany. He left an extensive herbarium with the synonymy and description of many new species, and an unfinished catalogue. A "Catalogue of Plants, Native and Naturalized, collected in the Vicinity of Cin-

cinnati, O." (8vo, Philadelphia, 1849), was prepared from his papers by Mr. W. S. Sullivant.

**III. Mathew Carey**, an American chemist, son of Isaac, born in Philadelphia in 1823. He studied chemistry in the laboratory of Prof. James Booth, and directed his attention to special branches of the science. His first published papers, in the "American Journal of Science," were a series of analyses of the coals from the various mines of Pennsylvania and Maryland. These were followed by papers on picric acid and its salts; on nitrate and nitrite of ethyl; on the ethyl and methyl ammonias, with their separation and reactions; on the germination and growth of seeds; on the platinum metals, with improved methods of separating them, &c. He is, however, best known by his papers on photographic chemistry. He made a special study of the chemical effects of light, more particularly on the silver haloids, upon which subject he published papers in various scientific periodicals. His "Manual of Photography" (Philadelphia, 1868; 2d ed., 1871) is a work of standard authority among photographers. **IV. Henry Charles**, an American author, brother of the preceding, born in Philadelphia, Sept. 19, 1825. He entered into business at the age of 17, and has been for many years at the head of a large publishing house in Philadelphia. During the civil war he organized the system of municipal bounties to encourage volunteering, and wrote much for periodicals. Since that time he has taken an active part in urging many important measures of political reform. A paper written by him at the age of 14, on the salts of manganese, was published in Silliman's "Journal." He also published papers on fossil and recent conchology, and wrote largely on literary and critical subjects. About 1857 he directed his special attention to the study of European mediæval history, and has published "Superstition and Force: Essays on the Wager of Law, the Wager of Battle, the Ordeal, and Torture" (1866; enlarged ed., 1870); "Historical Sketch of Sacerdotal Celibacy in the Christian Church" (1867); and "Studies in Church History: the Rise of the Temporal Power, Benefit of Clergy, and Excommunication" (1869). He is now (1874) engaged in collecting material for a history of the inquisition.

**LEACH, William Elford**, an English naturalist, born in Plymouth in 1790, died at San Sebastiano, Piedmont, Aug. 25, 1836. As a boy he loved to make collections of natural objects, and in 1809 he became a student at St. Bartholomew's hospital in London, then under the care of Dr. Abernethy. Before the completion of his medical studies he became known as an ardent student in zoölogy; and from Edinburgh he was called to London to fill the post of curator of the natural history department of the British museum. Here he found time to prepare papers for publication in the "Transactions" of the chief scientific societies in Europe and America. One of the first and

most important of these was that on "Crustaceology" (1813), wherein he advocated the separation of the *myriopoda*, *arachnida*, and *insecta* from the *crustacea*, which are all grouped by Linnæus under *insecta*. His other most important works were the "Zoölogical Miscellany," a serial commenced in 1814 and completed in 1817, in 3 vols., and the first division of the "History of the British Crustacea," of which 17 parts appeared. His severe labors finally so affected his eyesight and his general health that he was obliged to resign his curatorship, and to abandon to a great extent the pursuit of his favorite studies. In 1826 he visited southern Europe, where he made valuable collections of insects, which are preserved in the Plymouth institution and by the Devon and Cornwall natural history society. He died of cholera. His love of animals was excessive, and he had a peculiar faculty for subduing the most ferocious kinds. One of the most faithful and attached companions of his walks was a wolf which he had tamed.

**LEAD**, an elementary substance belonging to the class of metals, and having when pure the following characteristics: color white with bluish gray tint; lustre highly metallic; specific gravity 11.370 at 0° C., compared with water at 4° C. (Reich.); specific heat 0.03140 between 10° and 100° C., 0.03065 between -77.75° and 10° C. (Regnault), and 0.0402 between 350° and 450° C. (Person); coefficient for linear dilation for 1° C. between 0° and 100°, 0.00003005 (Calvert and Johnson), for cubic dilation 0.000039 (Kopp). Its melting point is 326° C.=619° F. (Rudberg, Person); latent heat of fusion, 5.369 (Person). The conductivity of lead for heat and electricity is expressed by the numbers 8.5 for heat at 12° C., and 10.7 for electricity, silver in both instances being 100 (Wiedermann). It crystallizes in octahedrons of the regular system. Lead is not sensibly volatile below a white heat if air be excluded, but even at this temperature it cannot be distilled like zinc. It is very soft, can be cut with a knife, and can be rolled or hammered into thin sheets. It is, however, but feebly ductile, and cannot be drawn into fine wire. Two clean and bright surfaces of lead may be united by simple pressure; tin and lead can also be united in the same way. The process seems to be one of true welding at ordinary temperatures, due to the softness of the metal. Finely divided metallic lead can also be united into a compact mass by pressure. When a pig of lead is heated near to its melting point, and then struck a sharp blow, it breaks like tin into a number of pieces having a remarkably columnar structure; the purer the lead the more columnar is the fracture. On bending cast or rolled lead no sound is emitted, as in the case of tin. When solidified and cooled slowly, lead is so soft that it can be indented with the finger nail; when melted at a high temperature and cooled suddenly, it is much harder.

It has a very low tensile strength, amounting, in the form of wire, and between 15° and 20° C., to only 3,620 lbs. per square inch when the strain is slowly applied, and 4,172 lbs. when rupture is effected suddenly. The presence of tin, antimony, and arsenic renders lead harder and diminishes its malleability; oxide of lead disseminated through the metallic lead has the same effect; copper alone does not render lead harder (Brigel). Lead gives a dull sound when struck, but if cast in the form of a mushroom it is sonorous.—*Chemistry of Lead.* The atomic weight of lead is 207 (O=16), its symbol Pb (*plumbum*). When a freshly cut surface is exposed to moist air, it becomes covered with a gray incrustation of oxide, which protects the lead from further oxidation. When very finely divided, metallic lead takes fire spontaneously on exposure to the air. At a red heat lead oxidizes readily. With oxygen it forms four compounds, the suboxide, protoxide, sesquioxide, and peroxide; the protoxide and the mixture of the protoxide and sesquioxide are of importance in the arts. The protoxide of lead (PbO) is made on the large scale by the direct oxidation of metallic lead. When lead is exposed to an oxidizing atmosphere considerably above its melting point, but below the temperature of fusion of the protoxide, the latter is obtained in the form of a yellow powder called massicot. Litharge is made in the process of cupellation (presently to be described), in which lead is oxidized at a high temperature. The oxide thus obtained is melted, and flows into a receptacle where it solidifies. The color of the resulting litharge is yellow or reddish, according as the cooling has been rapid or slow; it is composed of minute scales which have a talc-like feel; when molten, it conducts electricity. Protoxide of lead is slightly soluble in water, to which it communicates a decidedly alkaline reaction; it is soluble in acids and in alkalis; its solution in lime water blackens hair, horn, and other organic matters containing sulphur. Litharge absorbs carbonic acid from the air, and becomes partially converted into carbonate; it is used in the arts as a pigment, in the manufacture of glass, in glazing porcelain and earthenware, in the manufacture of varnishes, and in the preparation of lead compounds. Minium or red lead, as ordinarily made, is not of constant composition; it is generally expressed by the formula  $Pb_3O_4$ , and may be regarded as a compound either of the protoxide with the sesquioxide, PbO,  $Pb_2O_3$ , or of the protoxide with the peroxide,  $2PbO, PbO_2$ . It is prepared on the large scale by first oxidizing metallic lead to massicot, which is ground and levigated, and the resulting fine powder exposed to an oxidizing atmosphere on the hearth of a furnace for about 48 hours, at a temperature from 300° to 450° C., care being taken to prevent the temperature from rising sufficiently high to sinter the mass. The protoxide of lead absorbs about 1.5 to 2 per cent. of oxygen,

and is converted into a beautiful red or orange-red powder; when prepared from the carbonate or white lead it has generally an orange tint, owing to its fine division. Minium is used as a pigment and also in glass making; for the latter purpose it is preferred to litharge, owing to the larger amount of oxygen it contains, which serves to oxidize organic matters, or to peroxidize iron. Minium was known to the ancients; Pliny speaks of its being made by the calcination of white lead or ceruse, and mentions the adulteration of cinnabar with minium. Protoxide of lead forms numerous compounds with acids; the most important in the arts are the carbonate, acetate, and chromate. The carbonate, or white lead, was likewise known and used by the ancients; it owes its superiority as a pigment to its great "body" or covering power, and its opacity; it is not a simple carbonate, but a compound of hydrate with carbonate of lead, in proportions varying from 2 to 4 of carbonate to 1 of hydrate. There are three methods by which it is made on the large scale, known as the French, English, and Dutch methods; they all depend primarily on the formation of the basic acetate of lead and its conversion into carbonate. In the French method, a solution of basic acetate of lead is prepared by the digestion of litharge with acetic acid or a solution of acetate of lead, or by the action of acetic acid on finely divided metallic lead with access of air. Into this solution is forced carbonic acid gas, which precipitates two thirds of the lead, and this after settling is collected and dried. The supernatant clear liquid, which is a neutral or slightly acid solution of acetate of lead, is boiled with litharge, and the basic acetate thus formed again treated with carbonic acid. Experience has shown that it is not absolutely necessary to have the basic acetate of lead completely in solution as in the French process. In the English process, litharge, with about 1 per cent. of acetate (sugar of lead), is mixed with water to a moist mass, and exposed under constant stirring to the action of carbonic acid, when the litharge is converted with great rapidity into white carbonate. The Dutch process, which is the oldest in use, consists in exposing thin sheets of lead to vapors of acetic acid and carbonic acid for a long period. In earthen vessels are placed sheets of lead rolled into the form of a spiral; into the bottom of these vessels, but not in contact with the lead, is poured a mixture of weak vinegar and substances capable of fermentation, as yeast; a plate of lead serves as a cover. From 1,500 to 2,000 vessels thus prepared are piled together in so-called *loogen*, and surrounded with spent bark or stable litter; after six weeks the lead will be found thickly coated or entirely converted into white carbonate. The action is here substantially the same as in the other processes given; the lead is first converted into acetate, and subsequently into carbonate by the carbonic acid given off by the decomposing mat-

ters present, which also serve to maintain an elevated temperature. The Dutch white lead contains more oxide of lead and possesses more body than the French, but is said to have a greater tendency, when used as a paint with oil, to turn yellow on exposure. White lead is frequently adulterated with other substances, principally sulphate of baryta. As a pigment it has been to a considerable extent supplanted by oxide of zinc, which, though of less body, is cheaper and does not blacken when exposed to sulphuretted hydrogen. Protoxide of lead dissolves readily in acetic acid; four salts may thus be formed with varying amounts of oxide of lead, namely, the normal, sesquibasic, tribasic, and sexbasic acetate. The normal and tribasic acetates are of importance in chemistry and in the arts. The former when crystallized is generally called sugar of lead; the solution of this is used in medicine under the name of Goulard's water. The solutions of the acetate have a sweetish astringent taste, and absorb carbonic acid with avidity from the atmosphere; acetic acid also dissolves metallic lead when there is free access of air. The chromates of lead may be formed by precipitation of solutions of the acetate by a solution of bichromate of potassa; they are valuable pigments. The neutral chromate has a beautiful lemon-yellow color; the basic chromates are orange or red. Lead combines with great avidity with sulphur. Four sulphides are known to exist, of which only the protosulphide is important; it will be described further on in treating of lead ores. The best solvent for metallic lead is dilute nitric acid; it is but feebly attacked by sulphuric or muriatic acids, owing to the formation of insoluble sulphate or chloride, which protects the metal from further action by the acid. Sulphuric acid is generated in leaden chambers, and concentrated to a certain extent in leaden pans; a small quantity of lead is always taken up in concentrating the acid, which may be precipitated by dilution of the acid by water.—*Lead Poisoning.* Nearly if not quite all the compounds of lead are poisonous. In cases of acute poisoning, where a large quantity of a lead salt has been accidentally or otherwise taken, there is a metallic taste in the mouth, burning pain in the stomach, nausea and vomiting, followed by prostration and death or by chronic symptoms resulting in convalescence. Cases of chronic poisoning are very common among those engaged in smelting and handling lead, and in the manufacture and use of its compounds. Painters using lead pigments, workmen engaged in red and white lead works, in the manufacture of glazed cards, in the preparation of materials for making flint glass and glazing earthenware, and in bleaching Brussels lace, which is beaten with white lead to whiten the fibre, are especially liable to the chronic form of lead poisoning. Workers in metallic lead, as plumbers, are much less liable to the disease. It is a disputed point whether lead poisoning ever

results from working in lead mines; it may be that the sulphide of lead is innocuous, while the more rarely occurring carbonate is occasionally the cause of the disease. The susceptibility to the effects of the poison varies greatly in different persons. Some are able to follow their occupation as house painters or in manufactories of white lead without suffering materially, while an instance is on record where, after careful inquiry, a severe case of lead colic in a fishing-tackle maker could only be traced to his chewing bits of metallic lead, which he chipped off while engaged for a few days in making sinkers. Among artisans who use it in their work, lead is introduced into the system either by the air passages or by the digestive organs; it is inhaled in fine dust, or it is swallowed. In this way, carefully washing the hands previous to meals is of great importance as a preservative from its effects. Lead is often introduced into the system accidentally or as an adulteration in the manufacture of various liquors. The old name of lead colic, *colica Pictonum*, colic of Poitou, arose from the prevalence of colic there produced by its use in the manufacture of wine. Devonshire colic was traced by Sir George Baker to the use of lead in clarifying cider; the dry bellyache of the West Indies arose from its use in the distillation of rum. Many glazed articles of earthenware, when acted on by acids, give up the lead contained in their glazing. In Nos. 10 and 11 of the *Medicinische Zeitung*, published by the medical society of Prussia (1859), a case is cited of lead poisoning produced by snuff, and upon an analysis of the snuff by Höckel it was found to contain  $2\frac{1}{2}$  per cent. of lead. Snuff packed in lead foil always contains lead. The wrappings of lead foil when the package of snuff is first opened often exhibit an incrustation resembling mould, which is carbonate of lead. The lead foil is frequently tinned on one side; but this proves to be a very insufficient protection, as it is often corroded through, and the workmen are sometimes so careless as to put the tinned surface outside.—There are four distinct affections produced by lead: colic, arthralgia, paralysis, and brain disease or encephalopathy. Of these, colic is by far the most frequent, it having occurred in 1,217 of the 2,171 cases of Tanquerel des Planches (*Traité des maladies de plomb*, Paris, 1839), while arthralgia occurred in 755 cases, paralysis in 127, and encephalopathy in about 72. In chronic poisoning by lead, the skin is dry and of an unhealthy earthy color, the pulse is slow, the secretions generally are diminished, the bowels constipated, and the patient loses flesh and strength. When the gums are examined, a blue line is generally found on their free margin at its junction with the teeth, particularly the incisors; occasionally the mucous membrane lining the lips and palate has the same bluish color. If the patient be now attacked by lead colic, he is conscious of a sensation of pain and sinking, which he

refers to the centre of the abdomen. The bowels are obstinately constipated; there is constant pain in the belly, aggravated in paroxysms, and relieved or not increased by pressure. The walls of the abdomen are hard and sometimes retracted; there is often nausea and vomiting; dysuria is sometimes present, and the patient is exceedingly restless, sleepless, and anxious. Notwithstanding the gravity of the symptoms, the tongue is clean or but slightly coated, the skin cool, the pulse regular, and perhaps a little slower than natural. Left to itself, the disease is of uncertain duration, but under proper treatment it is ordinarily subdued in a few days; the patient, however, is subject to relapses, and when he remains exposed to the original cause of the complaint, the colic gradually becomes complicated with palsy, or perhaps it is terminated by a fatal affection of the brain. Where death has taken place, post-mortem examination shows no special lesion; but in this as in other varieties of lead poisoning, chemical reagents detect the presence of the metal in the blood and the tissues of the body. The following treatment adopted at Guy's hospital, London, where numerous cases of the disease are received, was contributed to Percy's "Metallurgy of Lead" by Dr. Owen Rees: "In the majority of cases an ounce of castor oil mixed with 10 drops of laudanum is given twice daily, and large hot poultices of linseed meal are applied to the belly. At night a draught, consisting of 40 drops of Battley's sedative solution (*liquor opii sedativus*) in camphor mixture, is prescribed, if the bowels have been acted upon by the oil taken during the day. In severer cases, accompanied with tenderness of the belly and retching, bleeding from the arm to the amount of 16 or 20 fluid ounces may be practised with advantage when the patient is young and strong. Pain and spasm are thereby very quickly allayed; and the stomach often loses its irritability and immediately afterward retains food and medicine. Where the patient is less robust, the application of 15 or 20 leeches to the belly followed by a warm poultice has been found to produce much relief. Castor oil with Battley's sedative solution is also given as in other cases. Clysters of this oil may be resorted to when the stomach is too irritable to retain medicine; and in all cases a pint of warm gruel injected into the rectum greatly soothes the patient." Mr. Williams states that according to his experience "no relief is obtained unless the patient is kept under the influence of opium for a few hours before giving purgatives and clysters; that while the spasm lasts the use of purgatives is futile, even clysters of castor oil being expelled without being soiled by faecal matter or tainted by faecal odor; that he begins his treatment by administering a dose of three or four grains of opium, and that in severe cases he has not seen any soothing effect from the injection of warm gruel into the rectum."—In lead arthralgia, besides the gen-

eral symptoms of chronic poisoning, the patient suffers from paroxysms of sharp, darting pains, commonly in the limbs, but sometimes in the trunk; these pains do not follow the course of the nervous cords, and they are increased by motion and diminished by pressure. In the intervals of the paroxysms the patient suffers from a sense of fatigue and constriction in the affected parts. Sulphur baths given daily for seven or eight days form the most efficient method of treatment. It would seem, according to the experiments of M. Melsens, that iodide of potassium administered internally has the power of eliminating lead from the system in cases in which it exists; and Valleix has found this remedy particularly efficacious in lead arthralgia. It may be given in doses of from 6 to 10 grains three times a day.—Lead paralysis is very rarely general; commonly it is confined to either the upper or lower extremities, and in these to one system of muscles. In five cases out of six the upper extremities alone are affected, and the paralysis is limited to the extensor muscles of the hand and wrist, the hand remaining permanently flexed, giving rise to the "dropped wrist." The muscles have lost their contractility, become wasted, and in bad cases after death look pale and as if converted into fibrous tissues. Often the paralyzed parts have more or less lost their sensibility; sometimes this loss of sensibility (lead anaesthesia) occurs independent of paralysis of movement. Lead palsy is rarely a primary affection, lead colic or arthralgia commonly preceding it. Its progress is slow, and in well marked cases the results of treatment are somewhat uncertain. The internal use of iodide of potassium for the purpose of eliminating the poison, the employment of small doses of strychnia, of electricity, and of friction to stimulate the injured muscles, are the means most to be relied upon. In all cases the disease is chronic, and the treatment requires to be persevered in for a long time.—Lead encephalopathy, brain affection produced by lead, is happily the rarest of the forms of lead poisoning. In a few cases the patient is attacked suddenly and without warning; but in the majority of instances, after the symptoms characteristic of the effect of lead upon the system are already well marked, and often after colic has supervened, the patient is attacked with headache, vertigo, sleeplessness or somnolence, frequency of pulse, and stiffness or pains in the limbs. The disease may now assume one of three forms. He may be suddenly attacked by a delirium, which in some cases is mild and tranquil, in others serious, the patient being dangerous to himself and others. In other cases he is seized with epileptiform or epileptic convulsions, in the intervals between which he only partially recovers the use of his intellect, remaining stupid and confused. Both these forms are apt to terminate in coma. In a third the patient is comatose or deeply somnolent from the commencement, neither delir-

ium nor convulsions being present. The mortality in encephalopathy is very high, more than one half of all the cases proving fatal.—Of more importance than the treatment of lead disease is the adoption of means for its prevention, and in this regard there is often much to contend with in the indifference of operatives to sanitary measures. Thorough ventilation and scrupulous cleanliness would in most instances prevent the contraction of the disease. Prophylactic remedies have been much used, those proving the most useful being drinks acidulated with sulphuric acid and milk. Cases of poisoning of animals in the vicinity of lead works are not uncommon. This subject was investigated by Dr. George Wilson in 1852, and the results were communicated to the royal society. He found the herbage in the neighborhood of a lead-smelting establishment to be impregnated with carbonate of lead, as well as the water in a stream used for washing ore. Fourteen horses and some cows died, it was believed, from the effects of the lead. Examination of the tissues of the animals showed the presence of lead in two cases, but not in the others. The lead found was largely present in the spleen. Instances have been recorded of the death of cows from swallowing the "bullet spray" scattered in target practice.—The frequent occurrence of cases of poisoning resulting from the very general use of lead pipe in the conveyance of water into dwellings, has led to investigations by many chemists into the action which different waters exert on this metal. Bright lead remains unchanged in perfectly dry air or in pure water deprived of air and protected from contact with it; but in a moist atmosphere, or in rain water, its brilliancy is soon dulled, and its surface is covered with a thin film of oxide, which adheres closely to the metal and protects it from further oxidation. The oxide, however, is partially soluble in water, and is no sooner taken up by this than it combines with any carbonic acid gas present or absorbed from the air, forming with it a film made up of silky scales of hydrated oxycarbonate of lead. More lead is then oxidized, dissolved, and converted into carbonate, and so the process of corrosion goes on. The oxycarbonate is almost insoluble in pure water, this taking up of it only about  $\frac{1}{100}$  of a grain to the gallon; and so perfectly does this separate from water, that if distilled water holding four or five grains of oxide of lead to the gallon be exposed to the air, the carbonic acid soon imbibed will cause the precipitation of silky crystals of the hydrated oxycarbonate, leaving in solution not more than one part of the metal to 4,000,000 of the liquid, or  $\frac{1}{800}$  of a grain to the gallon. But an excess of carbonic acid gives to the water the property of dissolving this carbonate of lead in the same way that it acquires also the property of dissolving carbonate of lime or limestone. So far it seems therefore that carbonate of lead is as likely to be found dissolved in water that comes

in contact with the metal, as carbonate of lime in water flowing over limestone. But the presence of certain salts in the water, even in very minute quantity, modifies materially this action. The sulphates, phosphates, and carbonates of the alkalies, and the sulphates, carbonates, &c., of the alkaline earths, or indeed any neutral salt, the acid of which can produce with lead or its oxide an insoluble compound, greatly diminish this action, even if present in the water to the amount of only four or five grains in the gallon. Bicarbonate of lime, which is almost always present in spring water, is especially remarkable for its protecting influence. The action of these salts is to form insoluble precipitates, which accumulate upon the surface of the lead, and cover it with a protecting lining. The protection is not, however, uniformly efficient, for there are certain other salts and acids which exert a contrary influence, and frequently completely overpower the beneficial effects of the first class named. Such are the chlorides and nitrates, and especially nitric and nitrous acids, in solution. These acids are generated in all waters containing decomposing animal matter, and therefore must be almost universally present to some extent. Dr. Medlock, who has given much attention to this subject, goes beyond other chemists in the importance he ascribes to the influence of these acids. The action of any water on lead, he states, is entirely due to the presence of nitrous and nitric acid, resulting primarily from the decomposition of organic matters and of ammonia contained in the water; and further, that water deprived of these acids, and of substances capable of producing them, has no action on lead, and may be conveyed with perfect safety through leaden pipes or stored in leaden cisterns. He devised a method of removing the nitrates and also organic matters from water, unless the latter be present in great excess. It was by suspending coils of iron wire or pieces of sheet iron in the water, and after a time filtering off the deposit. The iron decomposes the nitric acid, being itself peroxidized, and nitrous gas is liberated, which oxidizes the carbonaceous matters, so that they are resolved into carbonic acid and a lower oxide of nitrogen. The original paper of Henry Medlock, Esq., "On the Reciprocal Action of Metals and the Constituents of Well and River Waters," is the 24th article of vol. xiv. (4th series) of the "London, Edinburgh, and Dublin Philosophical Magazine" (1857).—The quantity of lead in solution in the gallon of water which will suffice to produce injurious effects, depends very much on the individual constitution and on the length of time that the water continues to be used. Dr. Penny, professor of chemistry at Glasgow, cites an instance of the health of a whole community being deranged by water containing only one ninth of a grain of lead to the gallon; and also quotes the conclusion of Dr. John Smith of Aberdeen, that

the limit of manifestly deleterious action would seem to be somewhere between one tenth and one twentieth of a grain. An interesting case is reported of the lead disease attacking a large number of the household of the ex-royal family of France in 1848, while they resided at Claremont, Surrey, England. The spring that supplied the palace had been selected for the purity of its water, and lead pipes had been laid 30 years previously to the palace, two miles distant. Four members of the family manifested some symptoms of poisoning after five months' use of the water, and in seven months 13 persons were alarmingly affected. The water on examination was found to contain one grain of lead per gallon. In experiments on the effect of Dantzic water on lead pipes, Dr. Lissauer found that the maximum amount of lead was present after one week's use. After the third week there was still a small amount, while after four weeks and during the six months succeeding the water was free from lead. He found further, that when the water contained 3·8 grains of carbonate of lime to the gallon the water was without effect on lead. In contact with a less oxidizable metal, lead is more readily attacked than when alone. Lead pipe is consequently found to be more corroded in the vicinity of the soldered joints than elsewhere. A notable quantity of lead has been found by Dr. Hayes in water contained in metallic ice pitchers where the sides were soldered to the bottom. A safe substitute for lead pipe for water supply has been found in the tin-lined lead pipe or lead-encased tin pipe. Careful investigation has shown that these pipes when properly made and jointed effectually resist corrosion by ordinary potable waters, although the waters of some springs and wells have been known to attack tin. As it is not probable that the use of lead pipe will be soon abandoned in cities, it is important to understand how it may be used with the least risk. The greater danger is in general to be apprehended the longer the water is allowed to stand in it before using, and the more the pipes are exposed to the alternate action of air and water as they are filled and emptied. Pipes in the upper parts of buildings are frequently left empty of water by this being drawn off below, and for this reason are more exposed to chemical action than those constantly filled. The first flow of water through any lead pipes that have been left some time without use will wash out the dissolved salts of lead. If this water is allowed to run waste to the amount of several times the contents of the pipes, that which follows is not likely to contain any injurious quantity of lead. By thus drawing off every morning the water that has stood in the pipes, and then washing them out by the continued flow for a short time, all risk of lead poisoning may be avoided.—The published information on the subject of lead poisoning and the effects of water upon lead is scattered through a vast

number of medical and chemical works and reports of sanitary committees. The most important works to consult are Christison on poisons, and L. Tanquerel des Planches on lead diseases, translated from the French by Dr. Samuel L. Dana (Lowell, 1848). Convenient reference may be had to the opinions of a great number of chemists in the "Collection of Reports (condensed)," prepared and published in 1859 by Mr. James P. Kirkwood, engineer of the Brooklyn water works; also to the "Report of the Metropolitan Board of Health" (New York, 1869), and an article by Prof. William Ripley Nichols on the action of Cochituate water upon lead pipes, in the "Second Annual Report of the Massachusetts State Board of Health" (1871). Appended to this latter article is a list of books and monographs on the subject.—*Ores of Lead.* Lead has been found in a few instances native, but such occurrences are extremely rare. The principal ore of lead is the sulphide or galena. When pure it consists of 86·6 per cent. of lead and 13·4 of sulphur. It crystallizes in the isometric system, the prevailing form being the cube; and it has a perfect cubic cleavage. Hardness 2·5 to 2·75; specific gravity 7·25 to 7·7; lustre metallic; color and streak pure lead gray. Heated in an open tube, it gives fumes of sulphurous acid; before the blowpipe on charcoal it fuses, emits sulphurous fumes, coats the coal yellow, and yields a globule of metallic lead. It is soluble in nitric acid. It occasionally contains, as impurities, antimony, arsenic, copper, zinc, and cadmium. All galena is more or less argentiferous, and also probably auriferous, but the physical characters give no indication of the amount of silver present. Generally galena occurring in true veins in the older rocks contains more silver than that occurring in deposits in the more recent formations. The following list shows the amount of silver in galenas from a few localities:

LOCALITY.	Percentage of silver.	Equal to troy ounces in a ton of 2,240 lbs.
Hartz.....	0·08 to 0·05	9·8 to 16·8
Sala, Sweden.....	0·05 to 0·75	16·8 to 245
England.....	0·02 to 0·08	6·5 to 9·8
Lead hills, Scotland.....	0·08 to 0·06	9·8 to 19·6
Monroe, Conn.....	3·00	980
Roxbury, Conn.....	1·85	544
Eaton, N. H.....	0·1	32·7
Shelburne, N. H.....	0·15	49·0
Missouri.....	0·0012 to 0·0027	0·4 to 0·9
Arkansas.....	0·08 to 0·05	9·8 to 16·8
Middletown, Conn.....	0·15 to 0·06	49·0 to 65·0
Pike's Peak, Colorado.....	0·05 to 0·06	16·8 to 19·6
Antimonial galena from Tuscany.....	0·825 to 0·72	106 to 235
Peru, undressed ore, but exceptionally rich.....	0·52 to 3·20	170 to 1183

According to E. J. Chapman, galena is seldom highly argentiferous except when associated with mispickel or other arsenical ore. Associated with galena, and generally resulting from its decomposition, are frequently found oxidized compounds of lead, as the carbonate,

sulphate, phosphate, and arseniate. In some localities these compounds are abundant, and form a considerable proportion of the ore raised. The carbonate of lead or cerussite crystallizes in the orthorhombic system, and contains when pure 77.52 per cent. of lead. It occurs both crystallized and earthy; in the latter condition it is white, if not contaminated by copper or other metals; it is the most abundant of the oxidized lead ores. The sulphate of lead, or anglesite, occurs frequently in orthorhombic crystals of great size and beauty; it contains 68.31 per cent. of lead. The phosphate or pyromorphite is found frequently in the upper part of lead veins; it occurs in beautiful green hexagonal crystals, which are composed of three molecules of phosphate and one of chloride of lead. The arseniate or mimetesite corresponds in composition to the phosphate, containing three molecules of the arseniate to one of the chloride; it occurs in yellowish crystals of the hexagonal system. All of the above oxidized compounds of lead, with the exception of the carbonate, have more of a mineralogical than metallurgical interest. Some mines are noted for the occurrence of fine crystallized specimens of these and other lead compounds. The Wheatley mine, near Phoenixville, Pa., has been one of the most celebrated mines in the world in this respect. The number of minerals occurring there is referred to subsequently. There are, further, a number of minerals containing, besides lead, other metals, as antimony, copper, and silver, which are subject to metallurgical treatment, but which are not properly speaking lead ores.—Galena is widely disseminated in nature; it is found in crystalline and stratified rocks, and occurs in veins, beds, and irregularly distributed masses. Two classes of deposits are to be distinguished: 1, those in which the galena is associated with other metallic sulphides, as silver, copper, iron, and zinc, and often combinations of these sulphides with antimony and arsenic; and 2, those in which the galena is nearly or quite free from associations with other metals. To the first class belong many of the most celebrated silver mines, as those of Freiberg in Saxony, Clausthal in the Hartz, Przibram in Bohemia, and many of those in the United States. The veins worked in these mines are generally in the older crystalline or metamorphic rocks, and usually belong to the class of true veins continuous in depth containing the metallic deposits and gangue minerals in regular bands or layers. Although the lead products of these mines may be relatively large compared with that of the other metals present, yet they would not be profitable were they worked for lead alone. The presence of lead is, however, advantageous in the extraction of the other metals, especially silver. The workable deposits of galena free from other metals are not very numerous; they are chiefly confined to England, Spain, and the United States. They

occur mainly in or are associated with limestone and dolomite, in pockets, layers, and gash veins, but rarely in true veins. The metals gold, silver, and tin are seldom found in workable veins except in the older and crystalline rocks, while lead is mostly found in unmetamorphosed and more recent rocks. In this respect it resembles zinc, with which it is often associated. "In Great Britain galena occurs in veins in palæozoic rocks, namely: in the carboniferous or mountain limestone in Cumberland, Durham, Northumberland, Yorkshire, Derbyshire, and Flintshire; in the Devonian in Devon and Cornwall; and in the lower Silurian in Shropshire." (Percy.) The mountain limestone series is made up of beds of limestone which alternate with sandstones and shales, having a thickness altogether in the northern counties of 2,000 ft., and in Derbyshire of 1,500 ft. The miners distinguish three classes of deposits: rake veins, pipe veins, and flat veins. The rake veins correspond nearly with what are called true or transverse veins, showing a comby structure and "slickensides," or polished walls; they do not, however, always descend through the strata in a regular manner, but go down by a series of vertical and oblique portions, the change of inclination being coincident with a change in the character of the rock through which the vein passes. The pipe veins are quite irregular deposits of no great length, more like what have been designated as gash veins. The flat veins are deposits formed between the layers of two adjacent beds. "As a general rule, the lodes of the limestone districts have a comparatively soft matrix; large bodies of clay, locally called 'flucan' and 'dowk,' often occupy a great portion of the original vein fissure, and these in many localities are found to alternate with portions of exceedingly pure and solid galena; while even the superficial clay, when a thick cap of that material overlies the back of the lodes, has often yielded large amounts of ore, as in the 'hushes' of the north and in Flintshire, and as most remarkably exemplified in the 'diggings' of Missouri. When the lodes, on the other hand, exhibit less of mechanical detrital matter, and are filled chiefly by crystalline deposits, the matrix consists most abundantly of calc spar, with which fluor spar and barytes are variously associated; while zinc blende, or in its absence calamine, is a general concomitant, iron pyrites comparatively infrequent, and spathic iron ore, quartz, and pearl spar, or occasionally witherite and calamine, are confined to certain districts and zones of depth. The general direction of the lodes is more or less east and west, although cases occur where some of the great 'cross courses,' or north and south veins, have in particular parts, as notably near Holywell in Flintshire, yielded large amounts of ore. The Devonian rocks ('killas') of Cornwall and Devonshire have for many years past been noted for the production of lead ores yielding a very large

proportion of silver, and the structure of the lodes themselves offers many points of high interest. They are invariably found at a greater distance from the granite bosses which form so striking a feature of these counties than the tin and copper-bearing veins, and usually in killas of a softer character. The majority of the lodes are cross courses, traceable in some instances for miles, although it seldom happens that the richly lead-bearing part has been found to extend for more than a few hundred feet, or at most fathoms, in length. The associated minerals are principally fluor spar, quartz, sometimes in a loosely granular state, often as a white hornstone, bitter-spar, zinc blende, and more rarely spathic iron ore, fahlerz, and bournonite, while the intersections with east and west veins have been marked by the occurrence of various ores of silver." (Smyth.) Other localities are the Silurian slates of Cardiganshire and Montgomeryshire, and near Shelve on the south of Shrewsbury, where the veins run east and west, and in the isle of Man, which yields a highly argentiferous galena.—In the southern part of Spain, in the mountain range of the Sierra Nevada, there are extensive deposits of lead ores, which have been mined by the Phœnicians, Carthaginians, Romans, and Moors, and are still productive at the present day; and the smelting of the immense masses of rich slags left by the Romans has been a profitable industry in recent times. The rocks of the Sierra Nevada are mainly mica, talcose, and clay schists, enclosing strata of dolomite and sometimes gypsum. The principal lead mines occur in the spurs of the Sierra Nevada, namely, the Sierra Cartagena, Sierra Almagrera, and the Sierra de Gador. "The former is composed of sedimentary rocks of the ancient transition strata, argillaceous schists, slate, mica schists forming the base of the fissured black crystalline limestones, sandstones, and conglomerates. The erupted rocks are greenish and porphyric, and they are *par excellence* the rocks accompanying nearly all the metalliferous deposits of this locality, which for the most part are in contact with schists and limestones, and extend over a large area. Although numerous veins of ore occur, yet more generally the ore exists in intercalated beds and irregular pockets in the limestones. In the districts of Almazarron the erupted rocks are traversed at many points by veins of galena, which would indicate that the ore is of later date than those rocks. There are two classes of ore, carbonates and galenas, of which the former predominate. The galenas delivered to the smelters vary in produce from 15 to 60 per cent. of lead, containing from 32 to 121 oz. of silver per ton of lead produced. The deficiency of water throughout the entire metalliferous district of the south of Spain, added to the absence of all motive power, will ever render the dressing of the ores difficult if not impossible." (Petitgand, quoted by Percy.) The Sierra Almagrera consists of argillaceous

schists, passing into mica schists, without any eruptive rocks, but traversed by a number of ore veins, the largest of which is called the Jaroso. This vein is about 18 ft. wide at a depth of 180 ft., narrowing to 4½ ft. at a depth of 420 ft. It is filled principally with brown hematite, throughout which is disseminated argentiferous galena, with some blende and copper pyrites. The Sierra de Gador is the most famous of all the Spanish lead-producing localities. The plateau on its summit is literally riddled with shafts of greater or less depth, and shallow excavations. The ore, mainly galena unassociated with other metallic sulphides, occurs in pockets of variable size and extent, sometimes isolated, sometimes continuous and corresponding to the stratification of the rocks. The ore is occasionally found in dolomite, but is then not very abundant. It is most productive in a yellowish clayey mass which contains small pieces of dolomite ore, and associated with masses of galena; or the whole deposit may consist of fragments of ore and rock enveloped in clay. The Sierra de Gador was the scene of extraordinary activity during the third decade of this century, the production amounting in 1827 to 42,000 tons. This enormous production overstocked the market, and the price of lead fell to a point below the cost of production. The ore was here largely obtained from shallow excavations which were soon exhausted. Mining is still carried on, but the production is at present small. These mines seem not to have been worked by the Romans, owing to the small amount of silver in the galena.—In the United States the most important lead deposits are found in the Mississippi valley. There are two prominent localities, known as the upper and lower mines, the latter in Missouri, the former included within the bordering states of Wisconsin, Illinois, and Iowa. The upper mines have been thoroughly investigated by Prof. J. D. Whitney in connection with the geological surveys of Iowa, Wisconsin, and Illinois, and the results of his studies are to be found in the published geological reports of these states. The following description is taken from these reports. The extent of this lead-producing region is about 4,000 sq. m., of which about 2,200 sq. m. is in the state of Wisconsin. The most productive portion of the region is that which lies between Dubuque, Galena, and Shullsburg, so that Iowa and Illinois raise more lead in proportion to the area over which mining operations have been conducted than Wisconsin does. A circle of 4 m. radius, with its centre a little N. E. of Galena, would include nearly all the productive diggings, with the exception of those at Apple river and in the vicinity of Elizabeth. It is probable that these mines were not worked by the aborigines. Fragments of galena have been found in the ancient mounds of the northwest, but no metallic lead. The discovery of lead ore in this region is attributed to

Le Sueur, who made a voyage up the Mississippi in 1700 and 1701, for the purpose of discovering ores. The first mining seems to have been done by Julien Dubuque, a half-breed Indian, who in 1788 settled on the site of the city which bears his name, and continued until his death in 1809. The land occupied by him was relinquished to the United States by the Indians in 1832. Leases were first issued by the government in 1822 (under the act of March 3, 1807), but mining did not become general till 1826-27. Owing to the difficulty of collecting rents, a resolution was adopted in the house of representatives in February, 1839, providing for the survey and valuation of these lands, with a view to their sale. This survey was made by Dr. D. D. Owen, with the aid of 139 assistants, in the autumn of the same year, and the report was transmitted to the land office in April, 1840. In 1847 the mineral lands were thrown open for entry and purchase. From records kept at Galena by Capt. Beebe and others, it appears that the amount of lead annually produced by the mines of this region increased from 5,000 to 10,000 tons (of 2,240 lbs.) between 1829 and 1839; after that it rose rapidly, and attained its maximum from 1845 to 1847; when it reached nearly 25,000 tons. Since that time the production has materially declined, and no trustworthy record of its amount is obtainable. A notable feature of this lead region is the entire absence of drift, although the country surrounding it on all sides is covered by gravel, pebbles, and bowlders, showing that the surface has not been covered by water since the earlier geological period, and certainly not during the quaternary period or that of the drift. Geologically, this district belongs to the lower Silurian. Resting upon a floor of crystalline slaty quartzose and granite rocks is the lower sandstone, the equivalent of the Potsdam of New York, from 300 to 500 ft. thick. Above this sandstone, and passing into it by alternating beds of silicious and dolomitic material, is the lower magnesian limestone, the equivalent of the calciferous sandstone of New York. It is nearly pure dolomite, heavy and compact, with a thickness of from 250 to 300 ft. It is slightly metalliferous, but no profitable mining for galena has ever been carried on in it. The next layer is the upper or St. Peter's sandstone, a purely silicious rock of but slight coherence; its thickness is 80 to 100 ft. Next in order come the buff and blue limestones. The former, allied to the birds-eye and Black river limestones, is a dolomite from 15 to 25 ft. in thickness, containing 10 to 25 per cent. of insoluble matter. The latter, the equivalent of the Trenton limestone, occurs in beds 20 ft. thick, and is the first group of strata in the series, as developed in the northwest, in which there are any purely calcareous beds, one of the divisions being a pure limestone with but a trace of magnesia; this blue limestone is decidedly metalliferous. The next formation containing the deposits

of galena was formerly called the upper magnesian limestone; but as the term originated in a misapprehension of the geological structure of the district, it has been superseded by the more appropriate name of the Galena limestone. This formation is a thick-bedded, light gray or yellowish gray dolomite, nearly chemically pure, distinctly crystalline in its texture, and usually rather granular, although occasionally quite compact; its maximum thickness is from 250 to 275 ft.; the middle portion is marked by an abundance of flints arranged in parallel layers. Next above the Galena limestone is the Cincinnati group, composed chiefly of argillaceous and silico-argillaceous shales, with a small amount of calcareous and magnesian carbonates; its thickness is from 60 to 100 ft. Above the Cincinnati group follows everywhere in the lead region and its vicinity the Niagara limestone, a heavy mass of pure dolomite, the third in order, containing like the Galena limestone silicious nodules or flints, especially in its middle and lower portion, arranged in layers parallel to the stratification. The thickness of the formation is undetermined; 350 ft. is given as an approximation. The outcrop of the Niagara limestone forms a marked feature in the topography of the lead region, since, owing to the peculiar denudation which has taken place in the district occupied by these rocks, it is left in abrupt and picturesque bluffs or cliffs along the principal streams. It also caps the mounds or outliers of rock which, severed from their original connection, stand like sentinels posted for observation. The lead occurs in the Galena limestone in the form of sulphuret or galena, filling either partially or entirely fissures and cavities in the rock. The fissures are confined to the one formation, and are hence not true veins, but are distinguished by the name of gash veins. The principal forms of occurrence are the vertical and flat crevices or sheets, and the expansion of these crevices into pockets, openings, and caves. The crevice openings and cave openings are mostly confined to the upper portion of the Galena limestone, and the flat sheets and flat openings to the lower portion. The latter is the only form of deposit which is found to any extent in the blue limestone. The vertical sheets are generally solid masses of ore, unaccompanied by gangue or veinstone, while the flat sheets are generally associated with blende, calamine, and pyrites. The longitudinal extension of a vertical sheet of ore varies from a few yards to 100 yards, and its vertical extension from 20 to 40 ft. The greater the length and width of the sheet, the more likely it is to pass into some other form, and lose its simple sheet character. One instance has been noticed of a continuous sheet of ore 140 ft. in depth. It is from the openings or caves that by far the greater part of the ore is raised. These are not generally filled with solid ore, but are partially filled with a mass of loose material, consisting of ore and

dolomite in fine particles, the result of the disintegration of the rock, and infiltrated clay. The sides of these openings are often covered with large and beautiful crystals of galena. An exceptionally large cave in the vicinity of Dubuque was 123 ft. long, 40 to 50 ft. wide, and 20 to 30 ft. deep, and when first opened was found half filled with detritus. The decomposition and disintegration of the upper layer of the Galena limestone gives rise to surface ore, the galena being distributed in the clayey loam of the prairies. It is called float mineral, and generally indicates proximity of mineral-bearing crevices. Some openings are noteworthy for their extraordinary productiveness. The Longworthy crevice, which has been worked in different places along a line of nearly three fourths of a mile, has produced, it has been stated, about 10,000,000 lbs. of ore. Several other cavities have produced from 2,000,000 to 4,000,000 lbs. The origin of these crevices seems to be due to the same cause by which what are called joints by geologists have been formed in almost every variety of rock occurring in large homogeneous masses, and especially where they have a decidedly crystalline texture. In the dolomitic rocks of the lead region we have all the conditions which usually occur in the formation of a well developed jointed structure. It is a marked feature of the district that the fissures have approximately an E. and W. and N. and S. direction, a fact which is everywhere recognized by miners, and which is of great practical importance. All through the mining district the heaviest diggings, with but few exceptions, will be found in crevices varying but little from E. and W. in their general direction. The N. and S. fissures, on the other hand, are usually much less important, as they are generally in sheet form or their bodies wedged in close between walls of solid rocks, and do not extend into openings. It is probable that the E. and W. course of the principal crevices has been determined by the fact that this is the direction of the axis of upheaval by which the whole lead region has been slightly elevated along the N. boundary of the district, and which will be seen to have determined the draining of the region. The axis of upheaval may have determined the course of the main set of fissures, while the tendency of all masses of rock thus situated to the formation of a subordinate set nearly at right angles to the principal ones may not unreasonably be looked on as the origin of the norths and souths. The disposition of ore in the fissures is due, according to Prof. Whitney, to precipitation of the lead from the oceanic waters, from which the rocks themselves were thrown down, by means of organic matter, either directly, by the reduction of the sulphates to sulphides, or by the generation of sulphuretted hydrogen by the decomposition of the organic matter, and the subsequent conversion of the metal into sulphide. The theory of the injection of the mineral masses from be-

low is untenable, owing to the entire absence of continuation of the crevices into the underlying strata. The cause of the abundant mineral deposition in the Galena limestone, while in the lower strata it is very slight, is doubtless due to the increase of animal and vegetable life during this period, as the fossiliferous character of the blue limestone abundantly proves. The galena from this region is of great purity, and contains but a trace of silver.—The lead deposits of Missouri may be divided into three districts, the southwest, the middle, and the southeast. The latter, by far the most important, are embraced in an area 5 m. in width and 100 m. in length. They were discovered and first worked in 1720 by Renault and his mineralogist La Motte, who came out with a large party under authority of a patent granted by the French government to John Law's famous company. Mine La Motte and the Potosi lead mines were discovered and opened by them; little however had been done up to Renault's return to France in 1742. The only smelting of the lead ores appears to have been done on log heaps, a wasteful process, much practised even of late years. In 1798, as stated by Schoolcraft in his "View of the Lead Mines of Missouri," p. 19, Moses Austin of Virginia, having obtained a grant of land from the Spanish government near Potosi, sunk the first regular shaft, and erected a reverberatory furnace, and also a shot tower. According to the same authority, there were 45 mines in operation in Missouri in 1819, giving employment to 1,100 persons; in 1811 Mine Shibboleth produced 3,125,000 lbs. of lead from 5,000,000 lbs. of ore. From 1798 to 1816 Mine à Burton and the Potosi diggings were estimated to have produced over 500,000 lbs. annually; and from 1834 to 1837 the production of Mine La Motte is rated at an average of 1,035,820 lbs. of lead per annum. For 14 years succeeding 1840 Dr. Litton in his state geological report makes the annual average of all the mines over 3,833,121 lbs. The lead ore is mainly confined to the third magnesian limestone, which is nearly a pure dolomite. No workable lead deposits have been found either in the overlying or underlying strata. Beneath the limestone, throughout this region, porphyries are found which are older than the Silurian limestones, and belong, according to Pumpelly, to the azoic formation, of which they may be the youngest member in Missouri. They are the near equivalents, in point of age, to the great iron-bearing rocks of Lake Superior, New Jersey, and Sweden. Various other ores are found associated with the galena, as the carbonate of lead, sulphuret and silicate of zinc, iron and copper pyrites, and at some of the mines, as Mine La Motte, ores of manganese, nickel, and cobalt. The surface of the country in the lead region is strewn with crystallized quartz derived from the lead-bearing rocks, and called by the miners "mineral blossom." The modes of occurrence of the lead ore are gener-

ally the same as those already described as common to the northern mines. The openings on the vertical fissures vary from the capacity of a cubic foot to 10 or 12 ft. square, and when very small are called pockets. They do not preserve a uniform course, but connect one with another by passages filled with material different from the walls, and extending toward every point of the compass. Vallé's mine in St. François co. and Perry's on its extension S. present a remarkable network of veins spread over an area of about 1,500 ft. in length by 500 in breadth, ranging N. W. and S. E. They are also examples of mines of a more permanent character than are found in the northern lead region. Vallé's mine was discovered in 1824, and it is believed has been worked ever since without interruption. Three series of caves are found, the second set 18 or 20 ft. below the first, and the third about 8 ft. below the second. The middle set has been most worked. They run out in every direction, and in some instances communicate by chimneys with the series above or below. They are filled with clay, loose rock, and ore, the last often an intermixture of galena and silicate and carbonate of zinc, which requires roasting and washing to prepare it for the furnace. Dr. Litton was of opinion that three fourths of all the lead obtained in Missouri had been from clay diggings overlying the rock. These operations have often been highly productive, but were carried on without system and without capital by men who had no interest or ability to prosecute the work in the rock, and thus the more permanent deposits have been passed over. In some localities in Missouri lead has been found in the coal measures, and has been worked in the sub-carboniferous limestone. In Moniteau co. a bed of dense cannel coal 40 ft. thick is traversed by a network of veins crossing at all angles filled with galena, zinc blende, and calc spar.—There are numerous deposits of lead ore in the Atlantic states, but none of them have as yet proved to be of economic importance. (See Whitney's "Mineral Wealth of the United States.") In the belt of metamorphic rocks which extends along the S. E. flank of the Appalachian chain, there are a number of lead veins, many of which have been worked, but subsequently abandoned, owing to the small quantity of the ore, or the difficulty of separating it from the associated minerals, or the expense of mining in hard rock. As some of the deposits are highly argentiferous, it is not improbable that work on them may be resumed with profit at some future time. Among the localities best known in the New England states may be mentioned Shelburne, Eaton, and Warren in New Hampshire, Northampton and vicinity in Massachusetts, and Middletown and Plymouth in Connecticut. Some of the ore from the Shelburne mine gave 84 oz. of silver to the ton of lead, and from the Warren mine 60 to 70 oz. to the ton. The mines in the neighborhood of Northampton, Mass., were

worked as long ago as 1765. The vein here is extensive and well defined, but is not very productive, and owing to the expense of mining work on it, though often resumed, has been as often abandoned. At Middletown, Conn., the existence of lead ore was probably known in 1651, when a license was granted to Gov. John Winthrop to work mines of this and other specified mineral productions, with particular reference to any he might discover near Middletown. There is no tradition of the time when the mine was first worked. The ore is highly argentiferous galena, but not abundant. Shipments made to England yielded 25 to 75 oz. of silver to 21 cwt. of lead; and what was remarkable, a peculiar fine-grained variety of the ore, such as is usually found to be most argentiferous, proved to be only one third as rich in silver as the coarsely cubical ore. The vein consists chiefly of quartz, often in crystallized plates or combs, with some calc spar, sulphate of baryta, and fluor spar, also blende and iron and copper pyrites. It is from 10 in. to 3 ft. in thickness, and is included in silicious and micaceous slates, with the dip and direction of which it appears at the surface to coincide. Active operations at this mine have long since ceased. In Dutchess co., N. Y., explorations were made for lead in 1740, and during the revolutionary war the committee of public safety sought to obtain supplies there. Veins of argentiferous galena are found also in Columbia, Washington, and Rensselaer cos., but have never proved productive. They traverse the strata near the junction of the metamorphic slates and limestones. The principal one is the Ancram or Livingston mine in Columbia co. On the other side of the Hudson river lead mines have been worked at various localities in the unaltered Silurian limestones and sandstones; but these, too, have all been abandoned as unprofitable. The most productive among them were in the Shawangunk grit of Ulster co., which overlies the Hudson river slate group. On the W. slope of the Shawangunk mountain, at Ellenville, several nearly vertical veins have been followed into the hard sandstone, the strata of which and the direction of the mountain ridge they cross nearly at right angles. The principal one of these yielded in 1853 galena which produced about 459,000 lbs. of lead, and 60 to 70 tons of pyritous copper, 50 tons of which produced 24.3 per cent. of metal. The vein was unlike the true veins of the metamorphic rocks, having no gangue or veinstones, but wherever productive filled between the walls with rich galena and pyritous copper, the former sometimes being 5 ft. thick unmixed with other matters. In places it contracted to a knife-edge seam in the hard sandstone, and again opened out in hollow fissures, one of which, extending to more than 100 ft. in depth, with an equal horizontal range, has never been completely explored. It was partially filled with tough yellow clay, in which were imbedded loose frag-

ments of sandstone, magnificent bunches of quartz crystals, and lumps of lead and copper ores; and its walls were also lined in places with the same ores. In these features a striking resemblance is exhibited to the "openings" in the western lead mines, although found there only in limestone. The vein is moreover like those of the western mines in lacking veinstones, and probably also in being limited to certain rock formations, beneath which it will not prove productive.—In Chester and Montgomery cos., Pa., near Phoenixville, is a group of lead and copper mines, in a small district of only 5 or 6 m. in length by 2 or 3 in breadth, some of the remarkable productions of which have already been noticed. They occur in gneiss and the red shale and sandstone of the middle secondary, cutting the strata in direction and dip. Nearly all the veins, of which there are 12 or more, are parallel to each other, directed N. 32°–35° E. and dipping steeply S. E. When confined chiefly to the gneiss, they produce as a general rule lead ores; when included in the red shale, their principal product is copper ores. Quartz and iron pyrites make up the larger part of the lodes, the latter in the upper portions of the mine decomposed to a soft brown gossan. This material sometimes yields 10 oz. of silver to the ton. Prof. H. D. Rogers, from whose "Geology of Pennsylvania" these data are obtained, enumerates the following large variety of metallic constituents of the Wheatley lode, besides the gangue of quartz and sulphate of baryta: of lead—sulphate, carbonate, phosphate, arseniate, molybdate, chromate, tungstate, chromo-molybdate, arsenio-phosphate, sulphuret, and antimonial argentiferous; of zinc—sulphuret, carbonate, and silicate; of copper—native metal, sulphuret, black oxide, malachites green and blue; of iron—the oxide containing silver, pyrites, brown spar, and hematite; native silver; black oxide of manganese, and native sulphur. Gersdorffite, or sulph-arsenide of nickel, has also been found. This mine was opened in 1851, and up to September, 1854, had produced, according to the manager's report, 1,800 tons of lead ore, principally phosphate, estimated to yield 60 per cent. lead. The Chester county mining company commenced operations in 1850 in the same vicinity, and up to November, 1851, had smelted 190,400 lbs. of dressed ore, almost exclusively phosphate, which produced about 47 per cent. lead. Dr. Genth found this kind of ore to contain 1·6 oz. of silver in 2,000 lbs.; the coarsely granular galena gave 16·2 oz., and the radiated and finely granular galena 11·9 oz. Operations ceased at these and the other adjacent mines in 1854 and 1855.—In S. W. Virginia and E. Tennessee many lead mines, not in the metamorphic belt, but in the great Silurian limestone formation of the valley of Virginia, have been worked with greater or less success for many years past, their ores being compact and crystallized carbonate of

lead as well as galena. Those belonging to the Wythe union lead company on New river, Wythe co., Va., are known to have been productive in 1754, and are still worked. All the mines of this region resemble in their geological associations and metallic products those of the western lead region.—The Washington mine, Davidson co., N. C., has attracted interest on account of its being the only mine in the United States that has produced much silver. It was opened in 1836 in the silicious and talcose slates of the gold region, and, like most other veins of the metamorphic rocks of this region, has the strike and dip of the strata. There are two parallel veins worked together, which dip steeply toward the north. They are underlaid by a granitic rock, and above is talcose slate. The mine was commenced for the carbonates of lead, which were found in considerable quantity in a heavy dull ore of earthy appearance, and also in glassy crystals. Some galena and phosphate were also met with. It was not until after smelting large quantities of these ores that native silver was discovered, and the argentiferous character of the lead ores. In 1840 the display of native silver in arborescent forms and disseminated through the magnesian veinstones was very striking, and excited expectations of great richness at lower depths; but the rich and easily reducible carbonate of lead was soon exhausted, the ore in greater depths consisting of zinc blende and argentiferous galena which presented difficulties in treatment. Till 1844 the mine continued to produce largely rich argentiferous ores, after which the ores gradually diminished in quantity; the yield of that year is stated to have been \$24,009 of silver and \$7,253 of gold, separated from 160,000 lbs. of lead, an average of 240 oz. of auriferous silver to 2,000 lbs. In 1851 the production was 56,896 lbs. of lead and 7,942·16 oz. auriferous silver, equal to 279 oz. to the ton of lead. Dr. Genth found the proportion of silver in the sulphurets very variable, running from 2·5 to 19·5 oz. to 2,000 lbs. An average sample taken from 2,000 to 3,000 tons of ore (1849) contained 45 per cent. of zinc, 21 per cent. of lead, and about 8 oz. of silver to the ton, with minute quantities of copper and gold. In 1852 mining operations were stopped as unprofitable, but were soon after renewed, and have since been continued intermittently. The mine was actively worked during the civil war by the confederates for lead. In 1871 it was 650 ft. deep, and produced about 400 to 500 tons of ore per month, part of which was slaty and required dressing.—There are numerous well developed lead veins in the azoic of northern New York. The most important are those of Rossie in St. Lawrence co., which are particularly famous for the magnificent crystallizations of calcite and galena. Although occurring in the older rocks, the galena is almost entirely free from silver. The Coal Hill vein, 2 ft. wide, in gneiss, was worked with great activity in 1837 and

1838; during these years 3,250,000 lbs. of lead were smelted. The mining was however so recklessly conducted, being directed solely to the richest masses, most easily reached, that the abandonment of the mine became necessary in the following year. Argentiferous galena occurs in the sub-carboniferous limestone of Kentucky, but mining operations, which have hitherto been very imperfect and superficial, have not been productive. According to Owen ("Kentucky Geological Survey"), the most favorable localities for development of lead mines in this formation, judging by analogy with English mines, are in Crittenden and Livingston cos. Lead also occurs in the blue limestone formation of central Kentucky. A vein 4 to 6 in. wide in Franklin and Woodford cos. has been somewhat worked, but did not prove profitable.—*Metallurgical Treatment.* Ordinarily the ores as they are raised from the mine have to undergo a process of preparation or dressing, to free them from adhering gangue, or to separate the different metallic minerals before they are ready for smelting. The character of this dressing will differ according to the amount and nature of the associated minerals. Simple breaking and hand sorting often suffices to separate masses of nearly pure galena, while the fine ore and that composed of an intimate mixture of a number of minerals is submitted to various mechanical processes, by which the different minerals are separated according to their specific gravities. The processes employed for the extraction of lead from galena are three in number: 1, the roasting-reaction or air-reduction process; 2, the roasting and deoxidizing process; and 3, the iron-reduction or precipitation process. In cases where oxidized ores are smelted, the second process is employed, with the omission, of course, of the roasting. The first process depends on the interesting reaction which takes place when sulphide of lead is heated either with sulphate or oxide of lead, resulting, when the oxygen and sulphur are present in the mixture in the proportion of two molecules of the former to one of the latter, in the production of metallic lead and sulphurous acid gas. Where this proportion does not exist, a residue will remain, consisting of the excess of oxide or sulphide, as the case may be. The reaction is shown in the following equations:  $PbS + 2PbO = Pb_3 + SO_2$ , and  $PbS + PbO, SO_2 = Pb_3 + 2SO_2$ . When therefore galena is partially roasted so as to form a certain amount of sulphate or oxide of lead, and the oxide thus formed is heated in intimate mixture with the unaltered sulphide, metallic lead at once separates. This reaction takes place to some extent when galena is placed on the top of an ordinary fire; it is in this way that the backwoodsman often obtains his lead for bullets. Galena has indeed been smelted on the large scale, in localities remote from civilization, by simply throwing it upon a fire of logs. In the second process the galena is roasted,

either completely or nearly so, and the resulting oxide, with some sulphate, reduced in a shaft furnace by the carbon of the fuel. In the third process advantage is taken of the superior affinity of sulphur for iron at high temperatures, so that galena heated with metallic iron is reduced to metal with the formation of sulphide of iron. The selection of the process for the treatment of lead ores depends largely on the presence or absence of other metals, and on the richness of the ores. Where galena alone is treated with but small amount of earthy matters, the roasting-reaction process is generally employed, and the smelting is performed either on an ore hearth or in a reverberatory furnace. During the early part of the last century the ore hearth was almost exclusively used in England; it is now mainly confined to the north of England, Scotland, and the United States. The American ore hearth, a modified and improved Scotch hearth, is used in the western lead regions, and was formerly extensively used in the state of New York. It consists of a working plate of cast iron about 3 ft. wide and 2 ft. from front to back, sloping downward and forward about 1 inch in 12. It has a diagonal groove on its upper surface for the flow of lead from the hearth to the cast-iron pot. Enclosing the back half of this working plate on three sides is a hollow casting 14 in. high, forming an air chest, through which the blast passes before it reaches the hearth; this arrangement serves the double purpose of keeping the cast-iron sides cool and heating the blast. The tuyere is on the back plate about 2 in. above the level of the hearth bottom. The operation is an extremely simple one. The fuel used is light wood or charcoal, and the mass of ore and fuel fills up the hearth and slopes down to the front, which is open. Fuel and ore are added in small quantities at short intervals, and the operation is continued uninterruptedly. The lead accumulates at the bottom of the hearth, and flows out in the groove in the front of the working plate. The yield is dependent to a considerable extent on the skill of the smelter in charging and stirring the mass. At the Rossie works in New York, now abandoned, the average yield of each hearth for 24 hours was about 7,500 lbs., with a consumption of wood per day of three fourths of a cord; the direct yield of lead amounted to 70 to 80 per cent. of that in the ore. There is also a considerable quantity of slag formed, which is subsequently treated in a low blast furnace. The great loss of lead, both mechanically and by volatilization in the ore hearth, has led to the general substitution of the reverberatory furnace in the roasting-reaction process. The chief advantage of the ore hearth is the small expense for plant and the simplicity of the manipulation. In the reverberatory furnace process, called also the English process, the same reactions are involved, but they are effected on a much larger scale, and are much

more completely under control. The process as conducted in Flintshire is as follows: The hearth of the reverberatory, which is about 11 ft. long with an average width of 9 ft., is generally concave, and slopes toward the "well" about the middle of the front side. The charge, 21 cwts. of ore, is evenly spread over the furnace, and stirred for two hours with an ample supply of air at as high a temperature as possible without causing sintering. The fire is then increased until the charge becomes semi-liquid, and any portion of it which may have run down toward the well is raked back to that which remains on the upper part of the hearth. The temperature is then lowered until the charge becomes thick, when it is pushed back toward the bridge and back part of the furnace. The fire is again raised, and the charge melted down as quickly as possible into the well, when slaked lime is thrown in and raked over the surface of the melted mass. The slag and reduced portions, being thus rendered sufficiently stiff, are again thrown up or "set up" on the sloping sides of the bed, there left to cool a little, and again remelted. Lime is again added, and the slag is pushed back from the surface of the lead, and left to drain a little, when the lead is tapped off from the well into a receptacle below. The slag is run or drawn out of the furnace in pasty lumps, and is termed "gray slag." The quantity of fuel per charge varies, according to the ore used, from 12 to 16 cwts. The ores treated contain from 75 to 80 per cent. of lead, and the yield is about 14½ cwts. of lead from a charge of 21 cwts. Of this yield 91 per cent. is obtained direct from the furnace, and 9 per cent. from the slag and fume. There are numerous variations in the manipulations practised at different works, but in its essential features the process is everywhere the same. It is necessary that the ores should be rich and not contain more than 5 per cent. of silica. It is evident that where oxidized ores are available in sufficient amount to mix with the galena, the preliminary roasting may be much abridged, or even omitted. The gray slags from this process are rich in lead (over 50 per cent.), and are treated by themselves in low blast furnaces, where reduction is effected by the fuel alone; the lead thus produced is known as slag lead. The roasting-reduction process and the precipitation process are never employed for pure rich lead ores, but are confined to ores poor in lead or those containing other metals, as copper, antimony, and nickel. The roasting-reduction process may be conducted in a great variety of ways. The roasting, which is generally effected in reverberatory furnaces, may be partial or complete. Partial roasting is resorted to where the ore contains, besides lead and silver, the metals mentioned above. In the subsequent smelting of this partially roasted ore there is produced, besides lead containing the greater part of the silver, a regulus containing sulphur, iron, lead, and copper. Where arsenic, nickel, and cobalt are

present, there is also formed a *Speise*, which contains these metals combined with iron. But where other metals than lead and silver are not present (iron and zinc excepted), the ore may be roasted completely ("sweet"), the heat being carried sufficiently high to sinter the mass and convert the oxide of lead into silicate. This agglomerated roasted mass is smelted in a shaft furnace, with the addition of iron, either metallic or as oxide, in order to effect the complete decomposition of the silicate of lead. In case the roasting has been effectual and all the sulphur driven off, no regulus is formed. Examples of this latter mode of treating lead ores (*i. e.*, complete roasting) are found at Pontgibaud, Vialas, and La Pisè in France, and at Bleiberg, Rhenish Prussia; of the former (*i. e.*, partial roasting), at Sala in Sweden, and Freiberg in Saxony.—As the smelting process at Freiberg is a good example of an intelligent metallurgical practice, involving the extraction of a number of metals, a brief outline of the process will be given. The ores smelted there are divided into five classes: A, *Glanze*, or bright lead ores, containing about 30 per cent. of lead; B, *bleiische Erze*, or leady ores, containing from 15 to 29 per cent. of lead; C, *Dürrerze*, or dry ores, consisting chiefly of veinstuff with small quantities of pyrites and galena, containing from 0.05 to 0.1 per cent. of silver; D, *Kupfererze*, or copper ores, containing from 1 to 10 per cent. of copper, averaging 3 per cent.; and E, *Zuschlagserze*, or ores containing less than 0.03 per cent. of silver, and chiefly composed of pyrites, mispickel, and zinc blende, with some lead and copper, mixed with quartz and calc spar. The mixture for smelting consists of about 60 per cent. of A, 20 of B, and 20 of a mixture of C and D. The lead in this mixture amounts to from 34 to 38 per cent., and the silver from 0.15 to 0.18 per cent. This ore mixture is roasted in charges of 10 cwts. in a double-hearth reverberatory for 16 hours, until all but 5 per cent. of sulphur has been expelled. It is then smelted in shaft furnaces with roasted reverberatory regulus (*Rohstein*), presently to be described, lime or fluor spar, slags produced in the same process, and certain lead products, such as furnace bottoms. Silver ores of class C, when containing over 0.1 per cent. of silver, are added to the mixture without roasting. The products of this smelting are *Werkblei*, work or furnace lead, containing 0.5 to 0.6 per cent. of silver, from 0.20 to 0.60 of copper, and about 1.5 of antimony and arsenic; *Bleistein*, lead matte or regulus, or blast-furnace regulus, consisting of the sulphides of iron, lead, and copper, and containing on an average 20 per cent. of lead, 10 of copper, and 0.20 of silver, besides small amounts of nickel, zinc, arsenic, and antimony; *Speise*, a compound of arsenic and iron, containing the greater part of the nickel and cobalt of the ore mixture; and *Schlacken* or slag, consisting of silicate of protoxide of iron, containing

about 5 to 6 per cent. of lead and 0.02 of silver. The lead is refined and then enriched by Pattinson's process, and cupelled for silver. The silver is dissolved in boiling sulphuric acid and a little gold obtained. The regulus is roasted and smelted with copper ores of class D and slags rich in lead, producing a second regulus containing 30 per cent. of copper and 0.18 of silver. This operation is thrice repeated, resulting in the production of two enriched reguluses containing respectively 54 and 73 per cent. of copper. This latter is roasted "sweet" in a reverberatory furnace, and treated with sulphuric acid of specific gravity 1.5, diluted with its bulk of water, and the oxide of copper dissolved out, leaving a residue containing lead and silver, and some copper, which is added in the course of the lead smelting. The solution of the copper is crystallized to blue vitriol, and sold as such. In each of the three or more smeltings of the regulus there are also produced lead, speise, and slag, which are the subject of further treatment. The slags from the ore smelting are treated with ores of the classes C and E, in a reverberatory furnace, producing a regulus (*Rohstein*) and slag. The former, containing from 7 to 10 per cent. of lead, 4 to 5 of copper, and 0.15 to 0.20 of silver, is added after the roasting to the ore-smelting mixture, as stated above; while the slag which contains but 1 per cent. of lead and 0.0028 of silver is thrown away. The speise obtained in the various smeltings of ore and regulus is, after concentration of the nickel and cobalt, treated for the extraction of these metals. There is further produced at Freiberg a considerable quantity of arsenical preparations from the fumes of the furnace, and a small quantity of bismuth is extracted from the test in which the silver is refined. The third of the smelting processes enumerated above, viz., the iron-reduction or precipitation process, finds its best example in the upper Hartz. Here sulphuretted ores are smelted, which contain on an average from 54 to 56 per cent. of lead and 0.10 of silver at the Clausthal and Altenau works, and 62 to 64 per cent. of lead and from 0.09 to 0.10 of silver at the Lautenthal works; they contain also some copper, zinc, and antimony. They are smelted with the addition of cast iron, in such proportions that the resulting lead shall bear the proportion in weight to the lead regulus of 4 to 3 or 5 to 4. The result of this smelting is practically the same as that at Freiberg; furnace lead, lead regulus, slag, and occasionally speise, are produced, which are treated substantially in the same way as the corresponding products in Freiberg. The use of cast iron has been in a great measure superseded by that of iron-finery slags, or in the upper Hartz by slags from copper smelting in lower Hartz, which are silicates of protoxide of iron containing between 1 and 2 per cent. of copper and a small amount of silver. The reaction in this case depends on

the reduction of the iron in the slag and the subsequent action of the metallic iron thus

formed on the sulphide of lead. The four products of lead smelting, viz., lead, speise, regulus, and slag, separate on standing according to their relative specific gravities, in the order named. The shaft furnaces used for lead smelting have been until comparatively a late period of small trapezoidal section, narrowing from the hearth to the throat, and blown with one or two tuyeres. In modern practice the furnace is generally circular in section, widening toward the mouth, and blown with eight or ten tuyeres. A marked improvement in smelting has been the result of this change in furnace construction. The yield and purity of product have been increased, and the consumption of fuel and loss by volatilization decreased. The Raschette furnace, of rectangular section and expanding walls, was introduced into the Hartz for lead smelting, with results much more favorable than the old style of furnace, but inferior to those obtained in the Pilz furnace, which differs from the Raschette chiefly in its circular section. A modified Pilz furnace has been introduced for silver smelting in Nevada, by Mr. Arendts of the Eureka consolidated works, with good results. A vertical section through the fore hearth and horizontal section through the tuyeres are seen in the accompanying figures. The hearth of the furnace is 3 ft. wide and  $4\frac{1}{2}$  ft. deep; the breast is open; the tuyeres, 12 in number, are on the sides and back of the furnace. The height of the furnace may be from 8 to 20 ft. above the tuyeres, according to the nature of the ore to be treated. Ordinarily the height is 10 ft. from tuyeres to charging opening. Mr. Arendts has also devised an automatic tap for the lead, consisting of a three-inch wrought-iron pipe in the furnace walls, one end communicating with the lowest part of the hearth inside the furnace, and the other emptying into a basin on the outside. It is said that by the use of this tap the furnace runs more regularly, the lead obtained is purer, iron sows are prevented, and the work of the smelters is lightened. (For fuller details in regard to smelting argentiferous lead in the western states, see the reports of R. W. Raymond, United States commissioner of mining statistics, and vols. i. and ii. of the "Transactions of the American Institute of Mining Engineers.")—Owing to the volatility of lead and its compounds, and to the strong draught of the furnaces used for roasting and smelting the ore, there is considerable loss of metal, as is abundantly shown by the white fumes in which lead works are often enveloped. The interception of this lead fume is of great importance both in an economical and sanitary point of view. The methods devised for this purpose may be enumerated as follows: 1, long horizontal flues; 2, condensation chambers; 3, exposure to artificial rain; 4, forcing through water; 5, intermixture with steam and its subsequent condensation. Experience seems to have proved that the most simple and effective method is the long horizontal flue,

terminating in a chimney sufficient to give the requisite draught. In the north of England there are flues nearly a mile in length. But this method is not always applicable, owing to unfavorable situation of the works. The use of steam, although theoretically the most promising of all, has not been found to give good results. The composition of the fume differs with the ores used, and also with the distance from the furnace, where the flue system is employed. It is mainly sulphate of lead mixed with a small amount of the earthy and metallic ingredients of the ore, and varies in color from gray to white. The loss of lead in the fume, when condensing arrangements are not used, has never been accurately determined. Fallize estimates it on an average as 10 per cent. of the assay value of the ore in lead, which is doubtless too high. The amount of lead obtained from the fume in proportion to that obtained from the ore and slag, at the Keld Head smelting works in England, for one year's work, was 7.63 to 100.—The character of the furnace lead depends on the nature of the ores from which it is produced. It is very frequently contaminated with other metals, notably antimony and copper, to a degree to make it unfit for use in the arts. It must then undergo a process of purification. This process, called indifferently refining, softening, improving, or calcining, is effected by melting the lead in the hearth of a reverberatory furnace, or in a large shallow cast-iron pan in the place of the hearth, and exposing it at a dull red heat to free access of the atmospheric air, or to the action of a blast of air. The foreign metals present oxidize and rise to the surface in the form of a scum or dross, which also contains a large amount of oxide of lead. This is skimmed off from time to time, and a fresh surface of lead exposed. The operation is continued until a test sample shows that the lead has acquired the proper degree of softness. The length of time required for this process depends on the amount of impurities present and on the extent of surface exposed. Three or more days are often required where the amount of antimony is considerable; and if present in very large amount, the lead may be completely oxidized before it is softened. The dross or scum, consisting mainly of oxides of lead and antimony, is reduced by coal and a second hard lead obtained, which is much richer in antimony than the first. If this cannot be profitably softened, it is sold as hard lead, to be used in the manufacture of bullets, shot, type metal, or pigments. The lead is frequently "poled" after tapping; this operation consists in the immersion of a piece of green wood under the surface of the molten lead; the escape of moisture and the carbonizing of the wood cause a lively ebullition, exposing a considerable surface to the oxidized influence of the air, and thereby assisting in the removal of the last traces of impurities. The following are analyses of a few varieties of furnace and refined lead:

—Silver is extracted from lead by exposing the melted argentiferous lead to the action of a blast of air at a temperature above the melting point of litharge. The lead is converted into oxide, while the less oxidizable silver remains unaffected. This process, called cupellation, is of great antiquity. In the opinion of Percy it is plainly indicated in Jer. vi. 29, 30: "The bellows are burned, the lead is consumed of the fire; the founder melteth in vain; for the wicked are not plucked away. Reprobate [refuse] silver shall men call them, because the Lord hath rejected them." "In this passage all the essential points are mentioned: the artificial blast, the oxidation or consumption of the lead, and the 'reprobate silver,' silver dross, or litharge. There is either no residue of precious metal, or what remains is contaminated with impurities, so tenaciously adherent as not to admit of being separated by the oxidizing and solvent action of molten litharge." The operation may be performed in a variety of ways. The two prominent systems are the German and the English. The German cupelling furnace consists of a large shallow hearth, somewhat elliptical in shape, about 8 or 9 ft. in diameter, made of marl or a mixture of limestone and clay, firmly stamped down, but retaining a certain degree of porosity and absorbent power for molten litharge. On one side is a fireplace for either wood or coal, and at right angles to it are the nozzles, generally two, for supplying the blast. Nearly opposite to the blast, and near the fireplace, is an opening for the removal of the litharge. The top or head of the furnace is movable, and is let down and luted on when the operation is ready to begin. From 35,000 to 37,000 lbs. of lead are treated at one operation, of which 13,000 are introduced in the form of pigs at the beginning, and the rest after the litharge has begun to flow. When the pigs first introduced are melted, there remains a sand-like scum (*Abzug*) on the surface, composed of impurities in the lead, some metallic lead and oxide, and particles from the hearth. This is removed, and the surface of the metal exposed. The first litharge which forms is pasty, and contains largely the impurities in the lead, principally antimony, and is called black litharge (*Abstrich*); it gradually becomes lighter in color, and passes into pure litharge. This is allowed to flow from the hearth as fast as formed by cutting notches in the marl of which

the hearth is composed, and is caught in iron moulds. The interior of the masses thus formed cools slowly, and has generally a red color, and is then sold as such. The rest of the yellow litharge is reduced to metal in furnaces by itself. That which forms during the latter part of the operation contains considerable silver, and the lead obtained from it is again cupelled, after concentration of the silver, by one of the processes presently to be described. When the operation is nearly completed the thin layer of molten litharge covering the silver breaks away, leaving the bright surface of the silver exposed. The silver is then said to "blick," and the mass is called blick silver. This still contains from 8 to 10 per cent. of impurities, and must be further refined. This could be effected on the hearth of the cupellation furnace, by simply continuing the operation at an increased heat; but as the loss of silver would be large under these circumstances, the silver is removed and placed on a small hearth especially prepared for it, and exposed at a high temperature to a strong blast, with occasional stirring, until it is "fine." In this operation it absorbs oxygen, which on cooling is often violently expelled, giving rise to the phenomenon of "spitting." In some cases a large amount of lead is cupelled until the silver is concentrated to the extent of 10 per cent. of the lead, when it is tapped off and further cupelled on another hearth. The cupellation of large quantities of lead at one operation is especially adapted to those cases where the lead is impure, as the foreign matters are then all removed in the abstrich, the litharge subsequently formed being pure. In Freiberg, Saxony, where the amounts mentioned above are cupelled at one operation, there are formed 400 to 600 lbs. of abzug, but no abstrich, as the lead is previously refined, from 32,000 to 33,000 lbs. of litharge, and 520 to 530 lbs. of silver; the loss of lead is from 8 to 10 per cent. Ore very rich in silver is often directly submitted to cupellation by placing it under the pigs of lead in charging the furnace. In the English system an elliptical frame of wrought iron, about 4 ft. long and 2½ ft. wide, is filled with moistened bone ash, firmly packed down, and then scooped out to the depth of about 3 in. This "test" is placed in a furnace, having a large fireplace on one side of the ellipse; at one end is the nozzle supplying the blast, and at the other is the

opening for the removal of the litharge. The test having been previously heated, melted lead is poured into the cavity in the bone ash, and oxidation at once commences. A constant supply of lead is kept up by gradually protruding pigs of lead through openings at the back of the furnace. When the lead in the test has become enriched, say from 200 or 250 oz. to 3,000 oz. per ton, it is tapped off, by drilling a hole through the bottom of the test, into an iron pot below, and cast into pigs. After tapping, the hole is plugged up with the same material of which the test is composed, and the process resumed. The enriched lead is placed on a fresh test, and the operation continued until the silver is fine. The loss of lead in the English process is said to be 5 per cent. The tests and hearth in both processes which have become soaked with litharge are broken up and added in the ore smelting.—The amount of silver in lead that will repay extraction by cupellation was formerly considered to be about 8 oz. per ton. Within the last 50 years two processes of concentrating silver in lead have been invented, by means of which silver to the amount of 2 oz. or less can be profitably extracted. The first of these processes, introduced by Pattinson about 1833, was universally employed until replaced in a great measure by Parkes's process, which was perfected about 1866. Pattinson's process depends on the fact that when molten lead containing silver is allowed to cool slowly, crystals of lead nearly free from silver separate, which can be removed by means of a perforated ladle, leaving a lead much enriched in silver. Lead to be submitted to this process should be refined, and contain only traces of antimony or other metals which impede the formation of crystals of poor lead. The following will serve to give a general idea of the manner of carrying out this process in practice. A battery of seven large iron pots, capable of holding  $6\frac{1}{2}$  tons of melted lead each, is arranged in a straight line, each pot being provided with a separate fireplace. At one end is a smaller pot holding 3 tons for the "poor" or marketable lead. Pot No. 4 we will suppose to contain 126 cwts. of molten lead, containing from 7 to 8 oz. of silver per ton of lead. As fast as crystals of lead form on cooling, they are taken out on a perforated ladle, allowed to drain thoroughly, and placed in pot No. 5; 90 cwts. of lead, containing from  $3\frac{1}{4}$  to 4 oz. of silver, are thus transferred, and the remaining 36 cwts., containing 16 to 8 oz., are ladled into No. 3. To No. 5 is added 36 cwts. of lead, with the same amount of silver as that already in it (16 to 18 oz.); and of this 90 cwts. of crystals, containing from 2 to  $2\frac{1}{2}$  oz., are ladled into No. 6, and the 36 cwts. remaining, holding 7 to 8 oz., transferred to No. 4. No. 6 is treated in the same way as No. 5; 90 cwts. of lead crystals, containing 1 to  $1\frac{1}{2}$  oz., being ladled into No. 7, and 36 cwts. of  $3\frac{1}{4}$  to 4 oz. into No. 5. From No. 7 crystals containing 9 to 10 dwts. of sil-

ver are ladled into the market pot, and then cast into pigs ready for sale. The nature of the operation in the other direction toward pot No. 1 is sufficiently indicated by the above. The operation goes on continuously, market lead being produced at one end, and at the other rich lead which is cupelled. It is found that concentration of the silver beyond 200 to 300 oz. to the ton of lead is not advantageous. From 846 cwts. of lead, of 7 to 8 oz. silver to the ton, there is obtained (in an example given by Pattinson) 36 cwts. of rich lead, containing 160 to 170 oz., and 810 cwts. of poor lead, with 7 to 8 dwts.; ratio of rich to poor, 1:22.5. There are numerous systems of conducting the process, but the above two-thirds system is perhaps the one most generally employed.—Parkes's process is founded on the fact that when zinc is thoroughly mixed with melted lead containing silver, and the mixture allowed to cool tranquilly, nearly all the zinc will rise to the surface and bring the greater part of the silver with it. Parkes first introduced his process in England in 1850, but owing to some practical difficulties it was abandoned. Experiments were made on it in Germany under the direction of Karsten in 1851, which did not result favorably. In 1866 the subject was again investigated in Germany, the difficulties previously encountered were overcome, and the process was made a practical success; it is now rapidly replacing Pattinson's process. The argentiferous lead is melted in a large pot, and zinc added in a perforated iron box and thoroughly mixed by stirring. The amount of zinc used is from 1 to  $1\frac{1}{2}$ , and sometimes as high as 2 per cent. of the weight of the lead; it is generally added in three portions. After the removal of the zinc crusts, the lead contains only traces of silver, but retains about 0.75 per cent. of zinc. This must be removed before the lead is marketable. It may be effected by heating in a reverberatory furnace, as in the usual process for softening, by prolonged piling, or by steam. The use of steam was introduced by Cordurié, and is found to be prompt and efficacious in removing the zinc. The steam is forced through the molten lead in a large kettle provided with a cover. When a sufficient quantity of zinc crusts have accumulated, they are liquated at a gentle heat, giving lead, which is returned to the desilvering pots, and a residue containing, according to the amount of lead removed by liquating, from 1 to 3 per cent. of silver. The treatment of this enriched product without loss of silver has been the greatest difficulty in the practical working of the zinc process. It is at present either heated in retorts, by which the zinc is distilled off and a rich lead left, or treated by Cordurié's process by steam, by which the zinc and part of the lead is oxidized, and a lead rich in silver left as before. In Havre, where Cordurié's process was first introduced, the steam in the treatment both of the desilverized lead and the zinc crusts is employed at a pressure

of 60 lbs. or more, while in the Hartz a pressure of 15 lbs. is found to be ample. The oxides of lead and zinc produced by the action of the steam on the zinc crusts contain considerable silver. In the Hartz they are added directly to the rich lead in cupelling; in Havre they are treated with muriatic acid to dissolve the oxide of zinc, and the residue, consisting mostly of chlorides of lead and silver, is melted in an iron pot, and a lead rich in silver obtained. The oxides produced by the dezincification of the poor lead are generally, after removal of shots of metal by washing, used for pigments. It has been found experimentally in the Hartz that when zinc is added in quantity much too small for complete desilverization, as for instance when 40 lbs. of zinc are used for 12½ tons of lead, a greater part of the copper and all of the gold is removed in the first skimmings. In this way small quantities of gold in lead may be concentrated. It is stated that formerly at Rothschild's works in Havre 250 tons of lead were treated every month by Pattinson's process, or 10 tons in 24 hours; 50 to 52 men were employed, and coal was used equal in amount to 40 to 50 per cent. of the weight of the lead. The loss on Cartagena lead was 6 per cent., on pure lead 4 per cent. In 1868, by the zinc process, with two mixing and two receiving pots containing 16 tons each, 20 tons were treated in 24 hours, or 500 tons per week; 23 men only were employed; the loss upon pure lead was 1 per cent., and the consumption of coal 10 per cent. of the weight of the lead; the cost was 25 francs per ton, against 55 francs in Pattinson's process. Later results from the Hartz show a loss of lead in the zinc process of about 1.5 per cent. of lead, not including the lead in the various large products which are either sold as such or worked over. (For a full discussion of the metallurgy of lead, see Percy's work on that subject, London, 1870, from which much of the above has been taken.)

—*Uses and Manufactures of Lead.* As metal, lead is principally employed in sheets for sulphuric acid chambers and concentrating pans, and for linings of tanks, cisterns, &c., in pipes for water and gas supply, and in shot. It further enters into the composition of many useful alloys. The compounds of the metal are mainly used as pigments and in the manufacture of flint glass. Sheet lead, formerly made by casting, is now generally made by rolling, or milling, as it is usually termed, the product bearing the name of milled lead. The Chinese prepare their well known tea lead by casting, notwithstanding its thinness. The operation is performed by two men, one of whom pours the molten lead from a crucible upon a large flat slab, when the other quickly places a large stone on the fluid lead, and presses it out to a thin flat plate, which is then removed and trimmed. English milled lead has largely replaced the tea lead of home manufacture in China. In the process of milling, slabs of lead, formed by casting in open moulds of cast iron,

are passed between cylindrical iron rolls until the lead has attained the desired dimensions. The rolls used are provided with suitable mechanism by which the distance between them can be regulated, and with reversing gear so that the slabs and sheets can be passed backward and forward. When the slab has attained unwieldy dimensions by extension, it is divided into pieces of suitable size, which are rolled separately. The same slab may be passed through the rolls 200 to 300 times, and become thereby elongated from 6 or 7 to 400 ft. If in rolling any depressions are observed on the upper surface of the slab, little pieces of sheet lead are placed in front of these depressions so as to force the subjacent lead into them and fill them up; when this is accomplished the pieces are taken off. The rolling may be conducted immediately after casting, while the slabs are still hot, or they may be allowed to become cold before rolling.—Lead pipe was formerly made by casting a short thick cylinder with the required bore, and rolling this cylinder out over a mandrel. Tubes made in this way were limited to 20 or 30 ft. in length. By the improved method a hydrostatic press is employed to force the melted lead through dies of the required sizes. The press is under the floor, through which the piston passes, entering a strong upright metallic cylinder. This can be filled with lead as required by a spout in the top, and the spout can be then closely shut. The cylinder is kept to the temperature of melting lead by an annular fireplace or receptacle for live coals by which it is surrounded. Connected with the top of the cylinder is a steel die of the diameter required for the outside of the pipe, and through its centre passes from the centre of the piston below the mandrel which determines the diameter of the bore. As the piston is driven upward, the lead in the cylinder is forced through the annular space between the fixed collar or die and the mandrel, and emerging above cools in the form of a finished pipe, and is immediately coiled upon a drum suspended above the apparatus.—Lead shot might with propriety be classed among the alloys of lead, for though sometimes made of simple lead of inferior quality, the metal is very commonly combined with arsenic, introduced in the form of white arsenic (arsenious acid) or of orpiment (the sulphuret). The effect of the arsenic is to render the hard, brittle qualities of lead, which are contaminated by antimony and iron, softer and more ductile, and of the proper consistency, when melted and subjected to the usual process in shot making, for taking the globular form. The more ductile the lead the less arsenic is required, but hard lead requires 1 per cent. or more of arsenic; usually from 0.3 to 0.8 per cent. is added. When the lead to the amount of two or three tons in a pot is melted, a circle of ashes or powdered charcoal is laid around the edge of the metal, and the arsenical compound wrapped in coarse paper is introduced in the centre by means of

a wire basket and stirred in. The pot is then covered and the lid luted down and left for some hours, during which time the arsenical compound is decomposed, the greater part of the arsenic combining with the lead, while a portion mixes with the litharge produced by the reaction of the white arsenic on the lead. The mixture is then tested by dropping a portion of it through a colander into water. If the particles assume a lenticular form, the arsenic is in excess; if they are flattened on one side, hollowed in the middle, or elongated, too little arsenic was used. When properly dosed it is run into bars, which are raised to the top of the shot tower, to be there melted and poured through the colanders. These are either hollow hemispherical iron disks or rectangular flat sheets, each one perforated with a set of holes of uniform size, made perfectly smooth and exact. The lead when poured must be of the proper temperature for the special size to be made, and the workmen are careful to keep a film of the oxide as a lining to the colander, which is thought to have the effect of increasing the rotundity of the shot, possibly by expediting its cooling as it passes through. The holes vary from  $\frac{1}{16}$  to  $\frac{1}{8}$  of an inch, but the shot are of larger diameter than the holes. In falling to the base of the tower the particles of semi-fluid lead, acted upon alike over their whole surface by the current of air, are made to assume the globular form, and by the time they reach the bottom they are sufficiently hardened by cooling to bear the shock of striking the surface of the vessel of water placed to receive them. Large-sized shot require a greater height than small-sized, and while 100 ft. is sufficient for the latter, the former will require 150 ft. Dr. Ure notices a shot tower at Villach in Carinthia, 249 ft. high, as the highest erection of this kind. Taken from the cistern of water, the shot are dried, then assorted according to their sizes by sifting them in a revolving copper cylinder set slightly inclined and perforated with holes, which increase in size toward the lower end. The smaller sizes thus drop through above and the larger lower down, and each size is received in its own box. The shot receive their superficial finish by being left for some time in a rotating cylinder with some pulverized graphite. Imperfect shot are separated from the truly spherical by allowing them to roll down an inclined plane, so arranged that the latter run straight down the middle and the former work off to one or the other side. Shot are also made by pouring lead upon a revolving table on which is placed a cylinder of perforated sheet brass. The table is revolved with a velocity of 1,600 ft. per minute on the periphery, and the lead is thrown by centrifugal action through the perforations in the sides, forming round brilliant shot, which strike against a linen screen placed so as to intercept them. A method has been patented in the United States of manufacturing shot without the high towers, sub-

stituting for them a low elevation up which a powerful current of air is blown, thus producing the effect of a long continued fall.—The most important alloys of lead used in the arts are those with antimony and tin. The alloys with antimony are more fusible than lead alone, but are much harder and more readily oxidized. Type metal is of variable composition, but in general may be said to consist of 4 or 5 parts of lead to 1 of antimony; sometimes tin is added. The alloy of tin and lead is used for soldering. Three varieties, known as fine, common, and coarse solder, are composed respectively of 2 parts tin to 1 of lead, equal parts of tin and lead, and 1 of tin to 2 of lead. Pewter is also composed of lead and tin; but other metals, as copper, antimony, and zinc, are often added. Common pewters contain 80 parts of lead to 20 of tin, others equal parts of the two metals, while the finer kinds contain but 16 to 20 per cent. of lead. The French government sanctions the use of vessels of 18 per cent. lead and 82 tin as quite harmless for containing wine or vinegar. Although so soft in itself, lead has the property of hardening tin. These alloys are distinguished by the facility with which they ignite and burn. The alloy of 4 or 5 parts of lead and 1 of tin burns like charcoal at a red heat, the combustion continuing like that of an inferior peat with the formation of cauliflower excrescences. This action appears to be due to the affinity which exists between the two oxides, which when fused, either alone or with silica or an alkali, produce a white opaque enamel, used for dial plates and also in earthenware. Bismuth unites readily with lead in all proportions, forming alloys which have no application in the arts, but are used to adulterate mercury. An alloy of 1 part of lead, 1 part of bismuth, and 3 parts of mercury is sufficiently fluid to pass through chamois leather. With bismuth and antimony lead forms an alloy which expands on cooling, and is used in casting stereotype plates. They are composed, according to Mackenzie, of 70 per cent. of lead, 15 of antimony, and 15 of bismuth. The triple alloys of lead and bismuth with tin or zinc are remarkable for their low melting point, which lies in many instances below the temperature of boiling water. Many metals, as zinc and copper, have but little tendency to form alloys with lead. When mixtures of lead and zinc are kept in a molten condition for some time at a comparatively low temperature, the zinc rises and forms a scum on the surface, leaving the lead nearly free from zinc. When a mixture of lead and copper, which has been quickly solidified, is heated to a point but little above the melting point of lead, a large proportion of the lead containing a little copper liquates out, leaving a residue of copper containing lead. This behavior of these metals is of practical value in the desilverization of lead and copper. In the first mentioned case, the zinc in separating from the lead carries the

greater part of the silver with it; and in the second, the lead which liquates from the copper likewise contains nearly all the silver. For an extended account of the alloys of lead the reader is referred to an article by Dr. Richardson in Watts's "Dictionary of Chemistry."

**LEAF.** The parts of a plant concerned in its nutrition are the root, stem, and leaf, which are termed the organs of vegetation. The leaf, as is the case with the others, is subject to many modifications, and is indeed sometimes made to serve other purposes than those of foliage; but its chief function is that of elaborating the crude material supplied by the roots and absorbed from the air into substances which will nourish and continue the growth of the plant. This work requires the light of the sun, and one of the processes incidental to it is evaporation; hence the leaf is generally constructed and arranged upon the

FIG. 1.—Pinnately veined Leaf, with Petiole and Stipules.

stem in such a manner as to expose the largest surface to the influence of light, and usually presents a broad evaporating and absorbing surface to the atmosphere. In its most complete form the leaf consists of an expanded portion, the blade or limb, which is attached to the stem by means of a leaf stalk or petiole, and at the base of this there are two foliaceous appendages or stipules. The stipules are characteristic of some families of plants and are always present in them, but in other families they are entirely wanting, and hence cannot be regarded as essential to the leaf; so with the petiole, which is frequently absent, the blade being attached directly to the stem, or sessile. The blade is regarded as the only essential part of the leaf, and though this presents itself in a vast variety of forms, the same general structure is manifest in all. In all ordinary leaves two distinct structures are visible: a framework or skeleton of fibres, and a green pulpy portion which fills

the spaces in this. When a principal bundle of fibres runs from the base to the apex of the leaf, it is termed the midrib; the branches from this are called veins, and the smaller subdivisions veinlets. In many leaves the smaller veinlets anastomose and thus form a complete net-

FIG. 2.—Palmately veined Leaf (Maple).

work; in others the veins run parallel and do not anastomose; as a general rule netted-veined leaves are found in dicotyledonous, and parallel-veined leaves in monocotyledonous plants. The form of the leaf largely depends upon the disposition of the veins; if there is a midrib with smaller branches or veins from each side, the leaf is said to be pinnately veined, and is usually longer than broad; but if there are several principal ribs starting from the base of the leaf, it is palmately veined, and its outline will be more or less orbicular. The skeleton or framework of the leaf consists of proper wood, and the microscope shows the various vessels, ducts, and fibres found in the stem itself; and this portion of the leaf is regarded as an expansion of the woody system of the stem, or rather of the inner bark. Its structure is beautifully shown in what are called

FIG. 3.—Parallel-veined Leaf.

skeletonized leaves, often seen as parlor ornaments; these are prepared by macerating the leaves in water until the softer parts have decayed, and arresting the process while the fibres still remain intact. The pulpy portion of the leaf, cellular tissue or parenchyma, consists of

several layers of cells containing chlorophyll or leaf-green; those nearest the upper surface are elongated and packed close together with but few spaces between them, while the cells of the lower part are irregular in shape and placed loosely together to leave abundant air spaces among them. The darker green color of the upper surfaces of most leaves is due to the more compact character of the cellular tissue in that part of the leaf. This portion of the leaf is regarded as an expansion of the green layer of the bark. Both surfaces of the leaf are covered by an epidermis consisting of empty, thick-walled cells, which cohere so firmly that it may often be stripped off from the other portions of the leaf; the cells of the epidermis are frequently very irregular in outline, and are mostly in a single layer, but in plants which have to resist long droughts there are several layers. The epidermis being impermeable, there could be no communication between the interior of the leaf and the atmosphere were it not for the multitude of breathing pores or stomata provided for this purpose. Each of these stomata is guarded by

FIG. 4.—Stomata of Epidermis (magnified).

a pair of curved cells, which, unlike those of the epidermis, contain chlorophyll; these cells are sensitive to the action of moisture, and by their change in form enlarge or diminish the opening. Through these pores the air has direct access to the spaces among the cells of the leaf, and as these are mostly near the lower surface, so the stomata are most numerous in that portion of the leaf. The stomata in some plants are 20 times more numerous in the epidermis of the lower than in that of the upper surface. The number is estimated to vary in different plants from 800 to 170,000 to the square inch of surface. The epidermis has its cells often prolonged into hairs of various shapes. By careful manipulation a transverse section of a leaf may be made, and this examined with a microscope of moderate power will show, first, a layer of empty cells of the epidermis; next, elongated cells, containing chlorophyll, with their longer diameters placed transversely and closely compacted; then similar cells with their long diameters parallel to the face of the leaf, with numerous air spaces

among them; and finally, the epidermis of the lower surface.—The forms assumed by simple leaves are almost innumerable, and as they are much used in systematic botany in the determination of species, they have a technical nomenclature which it would be out of place to

FIG. 5.—Cross Section of Leaf (magnified).

give here. The two principal divisions of pinnately and palmately veined have been mentioned. Each kind of venation in its modifications gives rise to two sets of forms as to general outline, and we have every gradation from the narrowly linear leaves of the grasses to the orbicular and kidney-shaped leaves. By modifications of the base of the leaf a set of forms, as arrow-shaped and heart-shaped, are produced, and by changes in the apex another set, from the long acuminate to the abruptly truncate. Changes in the margin are innumer-

FIG. 6.—Acacia, with Pinnate Leaves and Phyllodia.

able; in many leaves the edges are entire, but more frequently they are finely or coarsely serrate, toothed, or lobed, and the blade of the leaf is sometimes lobed or divided quite down to the midrib; the pinnately and palmately veined leaves when lobed giving two distinct sets of forms. So both these kinds of leaves

are often compound, *i. e.*, made up of smaller leaves or leaflets, which are articulated with a common petiole. Among trees, the locust is an example of the pinnate and the horse chestnut of the palmate compound leaves. Sometimes a stem appears to pass directly through the blade of a leaf; to such the name of perfoliate has been given; in some cases this appearance is produced by the lobes of a sessile heart-shaped leaf uniting to enclose the stem, and in others by the union of the bases of two opposite leaves.—The petiole is essentially of the same structure as the leaf, but its cellular tissue is usually small in proportion to its woody portion; its size and length, in proportion to the leaf, vary greatly; in aquatic plants with floating leaves it is several feet long, and in some palms the petiole is so large as to serve for making oars; in our garden rhubarb it takes on an unusual development, and is the useful part of the plant. In some plants the petiole is so short as to be barely perceptible, and in many entirely absent. In the aspen

FIG. 7.—Vetch with Leaf developed as Tendril.

the petiole is flattened at right angles to the axis of the leaf, which allows the leaf to move with the slightest motion of the air, and to keep up the continuous fluttering for which the foliage of this tree is proverbial. The petiole may be channelled, or furnished with a wing on each side, as in the orange, or it may be broadly expanded at the base and sheathe the stem, as in the *umbelliferae*, thus when present affording useful characters in describing plants. In some plants the blade of the leaf is wanting, but the petiole expands and becomes leaf-like, and takes upon itself the functions of the leaf; it is then called a phyllodium. The Australian acacias afford numerous examples of phyllodia; several of these, when raised from seed, produce upon the young plants the compound leaves common to the genus; some species, when but a few inches high, show a tendency to suppress the blade of the leaf; the successive leaves have wider and wider petioles and less and less blade, until the leaf-like petioles or phyllodia constitute the sole foliage; these have parallel veins and their edges instead of their surfaces are presented to the sky and earth.—Stipules, the accessory leaf-like bodies found in many leaves at the base of the petiole, present great variety in size, form, and duration; they frequently fall away as the leaves expand; in our tulip tree (*Viriodendron*), and in the related magnolias, they are only to be found as the leaves are unfolding, and are then very conspicuous; again, they remain as long as the

leaf to which they belong, and often form a large part of it, as in the garden pea, and in a related species the blade of the leaf is wanting, and the whole foliage of the plant consists of stipules. In some cases the stipules are distinct, but in many, as in the rose, they are attached to the petiole by one edge; in the docks, rhubarb, and other members of the *polygonum* family, they are united by both margins, and thus form a sheath which surrounds the stem. The appearance of stipules in the form of spines is not rare, and is noticeable in the common locust, the caper, and other plants. Those parasitic plants which, like the dodder, rob other plants of elaborated food, have no leaves, their function being performed by the foliage of the host to which they are attached. The prickly pear and others of the cactus family are usually regarded as leafless; but these have minute leaves upon the young stems, which soon drop, and in the older ones the whole surface of the stem performs the functions of the leaf.—Leaves vary greatly in size, but generally what is lacking in size is made up in number; and thus trees with minute leaves, like the arbor vitæ, where they are like small green scales clothing the branches, present in the aggregate as large a surface of foliage as trees with much larger leaves. A little plant of our fresh-water ponds has leaves only  $\frac{1}{8}$  of an inch long, while those of the *Victoria regia*, of the South American lakes,

FIG. 8.—Barberry with Spiny Leaves.

have a diameter of 6 ft., and afford a standing place for aquatic birds while they are watching for their prey. Some palms have leaves of enormous size, and an arad discovered a few years ago in Central America (*Godwinia gigas*) has leaves over 13 ft. long.—Leaves differ greatly as to their duration; some are fugacious, falling soon after they appear; those which fall at the close of the season are deciduous, and when they remain through the year they are persistent, as in the evergreens. In some of the evergreen coniferous trees the leaves of the former year fall as soon as those of the present year are developed, while in some firs they remain 10 or 12 years before they fall. In deciduous trees the fall of the leaf is as well provided for as its development, and is not due, as is supposed by some, to the advent of frost. A distinct line of separation is early visible, and before the leaf separates

the wound which would otherwise be left is covered with a prolongation of the epidermis of the stem. The leaf scars in the horse chestnut and ailantus are large, and show the points from which issued the bundles of woody fibre to form the framework of the leaf. In palms and some other monocotyledonous plants the leaves do not fall, but wither and decay upon the tree.—The study of the morphology of the leaf presents an endless variety to a close observer, and nothing in relation to the subject is more interesting than the many abnormal forms in which leaves, besides performing their proper offices as foliage, are made to serve the plants in other respects, or are quite turned aside from their normal uses to those which ordinarily belong to the root or stem. The scales which make up the greater part of a lily bulb are only the bases of former leaves which have become thick and fleshy by the accumulation of nutriment which is to be used in the future growth of the plant. This conversion of leaves into storehouses of food is strikingly shown in some seeds, in many of which the first leaves of the embryo plant, the cotyledons, or seed leaves as they are popularly called, are quite distorted by the accumulation of starchy and other matters intended to nourish the young plant; the common bean is a familiar illustration of this; in the bean the seed leaves fall away after they have parted with their store, but in the squash and others of its family the seed leaves, after they have served their purpose of helping the growth of the young plant, increase in size, turn green, and become proper leaves. The seed leaves of the oak, pea, and others are so distorted by the food they contain that they never come to the light and appear as proper leaves. The scales which surround the buds of deciduous trees are only modified leaves, some trees showing a regular gradation from the brown dry scale to the fully developed green leaf. In the barberry the leaves often appear as spines, and in *Fouquieria*, one of the chaparral plants of western Texas, the stem of which is formidably covered with sharp points, the spine is the midrib of the leaf from which the blade has fallen away. The common pea affords an illustration of the conversion of a portion of the leaf into a tendril to aid the plant in climbing, and in a plant of the same family (*Lathyrus aphaca*) the whole leaf is developed as a tendril. Among the abnormal forms of leaves, none are more interesting than the *ascidia* or pitchers, in which, as in our native pitcher plants (*Sarracenia*), the whole leaf forms a pitcher, or, as in *nepenthes*, the pitcher is an appendage to the leaf. (See PITCHER PLANTS.) Still more wonderful is the adaptation of the leaf to serve as a trap to catch insects, as in our carnivorous Venus's fly-trap. (See DIONÆA.)—In this brief description of the leaf it has been considered in only its normal condition of foliage and some of its readily understood transformations, but the botanist regards

the flower and its resulting fruit of whatever kind as only peculiar modifications of the leaf. The idea of tracing all the floral organs to one type, the leaf, had been hinted at before Linnæus, and the great botanist himself did not present the matter in such a way as to attract much attention; the poet Goethe proposed the theory in much the same form as it is now held, but it was not until the elder De Candolle presented it that the theory of metamorphosis was generally accepted.—The arrangement of the leaves upon the stem is such as to give the greatest possible amount of divergence, and though they may appear to be scattered without order, they are arranged in a manner definite for such species, and this has given rise to a distinct department of botany involving mathematical principles, called phyllotaxy.—It has already been hinted that the chief function of the leaf is to bring the interior of the plant into communication with the sun and air; it receives the liquid taken up by the roots, and in its tissues evaporation goes on; it not only permits but regulates evaporation by the wonderful mechanism of the leaf pores. But evaporation is by no means the sole office of the leaf; the air with its gases has free access to its interior, and here takes place the process of assimilation, about which so little is known, in which carbon, oxygen, hydrogen, and nitrogen are converted into organic compounds. We know that the chlorophyl is an active agent in effecting these changes, and that sunlight is essential to the proper performance of the leaf's functions. As water is so largely evaporated in the leaf, and as this, coming from the soil, must contain more or less inorganic matter in solution, it is not surprising to find that the leaf contains a large amount of earthy matter or ash, and that leaves in autumn have a larger percentage of ash than vernal leaves; the leaves show upon analysis 10 to 30 times as much ash as the wood of the same tree.

**LEAGUE** (Sp. *legua*; Fr. *lieue*), a measure of length used for estimating distances at sea, and by European nations upon land also. The nautical league is  $\frac{1}{3}$  of a degree, or 3 equatorial miles, or 3·457875 statute miles. The land league in England is 3 statute miles. In France it has been used for different distances, as the legal post league, 2·42 English miles, and the league of 25 to the degree, or 2·77 English miles. The Spanish league is still more variable, sometimes 17 and again  $17\frac{1}{2}$  being reckoned to the geographical degree. Upon the modern roads 8,000 Spanish *varas*, or 7,418 English yards, are estimated one league. The term is supposed by some to have come from the Celtic *leach*, a stone; and by others the Gallic *leuca*, league, is traced to the Greek *λευκός*, white, white stones being used by the Gauls to mark distances upon the roads.

**LEAKE**, a central county of Mississippi, traversed by Pearl river; area, 576 sq. m.; pop. in 1870, 8,496, of whom 3,005 were colored. It has a rolling surface and a light sandy soil.

The chief productions in 1870 were 157,648 bushels of Indian corn, 21,259 of sweet potatoes, 39,855 lbs. of butter, and 4,181 bales of cotton. There were 1,017 horses, 702 mules and asses, 2,317 milch cows, 1,062 working oxen, 3,483 other cattle, 3,473 sheep, and 11,535 swine. Capital, Carthage.

**LEAKE, Sir John**, an English admiral, born at Rotherhithe, Surrey, in 1656, died in Greenwich, Aug. 1, 1720. He distinguished himself in the fight with Van Tromp in 1673, when he served on board the Royal Prince, commanded by his father, by conveying relief to the starving garrison of Londonderry, and thus compelling the enemy to raise the siege. In 1702, during the war of the Spanish succession, he was made commodore, and appointed to the command of a squadron, with which he rescued Newfoundland from the French. For these services he was made rear admiral, and soon after vice admiral of the blue and knighted. In 1705 he constrained the French and Spanish to abandon the siege of Gibraltar; in 1706 relieved Barcelona, and captured Cartagena; and subsequently reduced the Balearic isles and Sardinia. After the relief of Gibraltar and the reduction of Cartagena, he was made vice admiral of the white, and presented with £1,000 by the queen; in 1707 he was appointed commander-in-chief of the fleet, and in 1709 rear admiral of Great Britain and a lord of the admiralty; and on retiring from active service, in the reign of George I., a pension of £600 was settled on him by parliament. He represented Rochester in parliament several years.

**LEAKE, William Martin**, an English author, born in 1777, died in Brighton, Jan. 6, 1860. Having entered the army, he was employed on special missions to Asia Minor and other parts of the East, and devoted himself to the exploration of Greece. He rose to the rank of lieutenant colonel, but retired from the service in 1823. He was a zealous champion of the national independence of the Greeks, and endeavored to procure help for them from the English government during the conflict with Turkey. In 1814 he published "Researches in Greece;" in 1821, "Topography of Athens" (2d ed., 1842); in 1824, "Journal of a Tour in Asia Minor;" in 1827, in concert with the Hon. Charles Yorke, "Notices of the Chief Egyptian Monuments in the British Museum;" in 1830, "Travels in the Morea;" in 1835 and 1841, "Travels in Northern Greece;" in 1846, "Peloponnesiaca, a Supplement to the Travels in the Morea;" and in 1854, "Numismatica Hellenica," the appendix to which was published in 1859, shortly before his death. He was assisted in many of his labors by his wife, a daughter of Sir Charles Wilkins. He also wrote several political works on Greece, including a "Historical Outline of the Greek Revolution" (1826).

**LEAMINGTON**, or **Leamington-Priors**, a town and watering place of Warwickshire, England,

on the river Leam, 20 m. S. E. of Birmingham; pop. in 1871, 22,730. It is one of the handsomest towns in England, and has a college, a Latin school, an institution for the blind, a museum, a music hall, and a theatre. Its only manufacture is that of gloves. Its prosperity and importance have mostly arisen from its mineral springs, which were discovered in 1797, and are of three kinds, sulphurous, saline, and chalybeate. The surrounding country is picturesque and beautiful, and the castles of Warwick and Kenilworth, as well as Stratford-upon-Avon, are not far distant.

**LEANDER**. See HERO.

**LEAP YEAR**. See CALENDAR.

**LEAR, Tobias**, an American diplomatist, born in Portsmouth, N. H., Sept. 19, 1762, died in Washington, D. C., Oct. 11, 1816. He graduated at Harvard college in 1783, and in 1785 became private secretary to Gen. Washington, by whom he was always treated with great courtesy and regard. For several years he attended to the details of Washington's domestic affairs, and was most liberally remembered by him in his will. In 1802 he was consul general at Santo Domingo, and afterward consul general at Algiers and commissioner to conclude a peace with Tripoli. He discharged this latter duty in 1805 in a manner which gave umbrage to Gen. Eaton, who in concert with Hamet Caramelli, the deposed bey, had gained important advantages over the reigning bey. It was thought that to accept terms of peace at this juncture was to throw away the fruits of hardly earned success; but Mr. Lear's conduct was approved by his government, though much blamed by a portion of the public. He returned shortly after to the United States, and at the time of his death was employed in Washington as accountant of the war department.

**LEARCHUS**, a Greek sculptor of Rhegium, in southern Italy, who flourished probably between 700 and 650 B. C. He belongs to the semi-mythical Dædalian period, and the accounts of him are vague and confused. Pausanias mentions a statue of Jupiter attributed to him in the brazen house at Sparta, which was considered the most ancient work of the kind. It was made of hammered pieces of brass riveted together.

**LEASE**, in law, the contract whereby one party (the lessor or landlord) transfers to another party (the lessee or tenant) the use and possession of real estate. The word is sometimes used also to designate a contract for the letting and hiring of personal property. No certain words or forms are necessary for this purpose; but a lease must describe the premises to be demised with an accuracy that is sufficient for certain identification; though any inaccuracies or uncertainties as to names, dimensions, locations, amounts, or terms may be explained if the other parts of the instrument suffice to make them certain. As a general rule, they may be explained by evidence

outside of the contract, provided this evidence neither varies nor contradicts the written contract. If the uncertainties cannot thus be cured, they may be rejected, if they leave behind them a good and sufficient instrument. Generally, anything, whether real or personal, which is hired to be used, carries with it all the appurtenances and accompaniments already connected with it, and proper or necessary for that use of it. We will in this article consider: 1, the right and obligation of the lessor; 2, those of the lessee; and 3, some special rules of law applicable to leases.—If the lease be under seal, there is an implied covenant of good title in the lessor, and in all leases there is one of quiet enjoyment by the lessee. If the lease contain an express covenant of renewal, on reasonable terms, which do not imply perpetuity, the law enforces them. But a lease for six years, with a covenant to renew “on the same terms,” means the same terms excepting the covenant to renew, which will be omitted; for otherwise this covenant to renew would amount to a perpetuity, which the law prohibits. The landlord is under no obligation to repair the premises, without an express covenant to that effect; and it seems to be the decidedly prevailing rule, that the uninhabitableness of the premises is no defence against a claim of rent. The tenant is bound to pay his rent as agreed on, but not to pay the taxes unless the lease so specifies; but this may be inferred from an agreement that the lessee shall pay his rent “free from taxes and charges,” or “a net rent,” or any similar phraseology. In general, if the lease does not contain a clause giving the lessor a right to reënter and oust the lessee on his failure to pay rent, the lessor has no such right. And if there be such a clause (as is commonly the case in American leases), the law is exceedingly exact and punctilious as to the exercise of this right of reëntry. That is, to justify it, a demand must be made for the rent due, and of the precise sum, on the precise day when it is due, at a convenient hour before sunset, and at the very place where it is payable if one be specified, or otherwise at some accessible, conspicuous, and noticeable place on the premises. Without express agreement, a tenant is not bound to make repairs. It has been sometimes held, however, that he was bound to make such repairs as his own use of the house causes to become necessary, or such as are called for by some accident and are required to prevent the premises from becoming untenable. Generally, an outgoing tenant should leave the premises wind and water tight, but is not bound to any ornamental repair, unless his covenants require this of him. If the tenant agrees to make repairs, and to leave the premises in good repair, he is not justified in not doing so by the fact that the premises were not in good repair when he took them. If, with no obligation on his part to repair, he chooses to repair, the lessor is not bound to

repay him unless he promises so to do. It is important to know, that if a lease contains a covenant on the part of the lessee to keep the premises in repair, and to return them in good repair, he must not only repair if injured by a fire, but rebuild if the house is burned down, unless it be done by the act of God or of the public enemy. And if there be no such clause, although the lessee is not bound to rebuild, he is bound (by a prevailing but not universal rule) to continue to pay rent during the lease. Hence the best and most carefully prepared leases in recent times provide expressly (and all leases should), that if the premises shall be made untenable by fire, in whole or in part, the rent shall cease or abate proportionably until repair or rebuilding; and the clause requiring repair and a return of the premises in good condition contains the exception, “unless in case of injury by fire or other unavoidable accident.” In the absence of express covenants, the tenant is not bound to rebuild a house burned down through his own negligence or that of his servants. The tenant of a farm is bound, without express covenants, to manage and cultivate the same in such wise as good husbandry and the usage of the neighborhood require; and for any wide departure from this he would be responsible in damages. A tenant may assign and transfer, if he do not covenant otherwise, the whole or any part of his lease. Technically, if he transfers the whole, it is an assignment; if less than the whole, it is under-leasing. If therefore he covenants, as is commonly done, “not to assign, transfer, or set over” the lease, this does not restrain him from under-leasing any part of it; and to prevent this, the words “or any part of it” should be added.—A tenant cannot defend against his landlord’s claim for rent, by denying or contesting his title to the premises, unless the tenant can show that the landlord caused the tenant to accept the lease by a fraud upon him. But it was always held that a landlord forfeited his rent, and authorized the tenant to cancel the lease, by his expulsion of the tenant from the premises; and now it seems to be law, at least in the United States, that the lease is cancelled and all right to rent lost by any violent outrage or indecency on the part of the landlord, or any intentional and material interference with the tenant’s proper use and enjoyment of the premises. (For the right of an outgoing tenant of a farm or garden to his crops, see EMBLEMENTS; for his right to remove anything he has added to the premises, see FIXTURE.)—The lease may be for the life of either the lessor or the lessee or any other person, and then the lessee has a freehold, which is considered in the law as real estate. Or it may be for any term of years, and then it is a chattel only, although a real chattel; for the law regards a lease determinable at a time certain, however distant that time, as a less estate than one for the life of any person, however old or feeble he may be.

Where a tenant, with consent of the landlord, enters into possession without any express bargain, he is a tenant at will. To avoid some technical incidents of this tenancy, there grew up in England a custom, which the law soon sanctioned, of considering such an estate as a tenancy "from year to year." The one essential principle is, that a tenancy at will may be determined by the will of either party, but only after reasonable notice given by the party intending to terminate the tenancy. There is no uniformity either of rule or usage as to what this notice should be. In some instances, a notice of six months may still be necessary, as it is in England. One of three months is more frequently sufficient; and in some states the notice must be equal to the interval between the periods of payment of rent. The rule is given in most of our states by statute, but depends in some upon adjudication or usage. Generally, the notice should cover the whole of the interval between payments. Thus, if the rent is paid quarterly, and three months' notice is sufficient, and the notice is given in the middle of a quarter, it takes effect at the end of the next quarter. No particular form of notice is necessary; but there must be reasonable certainty in the description of the parties, of the premises, of the purpose, and of the time. If a tenant for years holds over after the determination of his lease, he is technically a tenant on sufferance; and a tenant on sufferance is not a tenant at will. But by the prevailing rule of this country, such a person, if the lessor do not object to his holding over, is a tenant at will, holding upon all the terms and conditions of the expired lease which have not necessarily expired with it; that is, for example, he pays the same rent, at the same time.—If the lessor sells and transfers all his estate, the tenant now owes rent to the purchaser. If he sells a part only, there must be an apportionment of rent. So if the lessor die in the midst of the term, the rent is apportioned accordingly. If the lessor and his assignee agree as to the apportionment, the lessee is bound by it, because it is of no interest to him whether he pays to one or another.—As to the remedy of the lessor for rent due, in some states the law of distress for rent remains. (See DISTRESS.) Where it does not, the lessor has only the same remedy he would have for any other debt of the same amount.—There are in most of our states provisions resembling those of the statute of frauds, which determine what leases may be oral, and what must be in writing. So also it is generally provided that leases of a certain length (most frequently seven years) should be recorded in the registry of deeds.

**LEATHER** (Sax. *lether*, from *lithe*, *lither*, soft, flexible), an insoluble compound of the gelatine and fibrine of hides and skins with tannic acid, though under the general name of leather are included many kinds in which the hide or skin is preserved and made suitable for various

uses without such chemical union of the gelatine and tannin, and also where other materials than tannic acid are used in combination with the gelatine and fibrine of the skin. From the most remote periods leather has been prepared for clothing and various useful and ornamental articles. The Hebrews ornamented it by giving it bright colors, as appears by the mention in Exodus of rams' skins dyed red; and they employed it, after the manner of the Egyptians, for vessels to contain water, and for a multitude of other uses. The paintings and sculptures of Thebes represent many of the methods of working leather practised by this people as very similar to those of the present time. Figures of men are seen currying, stretching, and working it, employing a semi-circular knife like that of modern curriers, the awl, a stone for polishing the leather, and other implements such as shoemakers now use. In their shops a prepared skin was suspended as the emblem of their trade, together with ready-made shoes and other articles in leather. For covering harps, shields, &c., their leather was ornamented by embossing and coloring. For strong cords it was cut into thongs and twisted like ropes; and it was also used in the form of straps. For tanning they used the pods of the *sont* or acacia, the acanthus of Strabo and other writers, and probably also the bark and wood of the *rhus oxyacanthoides*, and the bark of the *acacia seal*, both natives of the desert. Of the methods of preparing the leather used by the Romans no accounts are preserved; and the processes of the middle ages also are lost. The Saracens, it is recorded, used alum, the efficacy of which for preserving skins is well understood. The Calmucks at the present time make use of a solution of alum and of static root, and also of sour milk, in preparing the skins of sheep and other animals. From the largest species of sea carp they have from remote times prepared garments which are nearly water-proof, making use of sour milk, or some astringent, with which the skins, first dried and cleaned, are dressed three times a day, after which they are finished by exposure for several days to a dense smoke. The Britons exported skins in early times, but afterward learned the art of tanning, and carried it on in establishments of great extent erected on the banks of the streams. Many rude nations now prepare leather by methods of their own. In both North and South America the dried skins, cleaned from the hair, are placed in earthen vessels with the powdered brains and some water, and heated to about 95° F. The cerebrous matter forms a lather, which thoroughly cleans the skins and makes them pliable. After remaining immersed for some time, they are taken out and stretched tightly in a frame, in which state they are rubbed with a smooth stone to expel the water and fat. Sometimes after this they are also smoked, by which they are made to resist better the action of water. In the Pacific countries of North

America leather is skilfully tanned by the natives, who employ some of the vegetable productions of the country for the purpose. The dressing and working of leather in Japan and India are considered the most degrading of all pursuits; the class that practises them is tabooed, and others are contaminated by communication with any of its members.—*Hides and Skins.* The heaviest ox and cow hides form the principal material from which sole leather is made; those from cattle which are not fully grown, and also those from the smaller cattle of India and Africa, are generally made into what are called upper leathers, in contradistinction from calf skins; upper leather, as known to the trade, including kip, wax kip, grain, buff, and split leather. Horse hides are used to only a limited extent in the United States, but are largely manufactured in Europe, the leather being known there as cordovan (from Cordova in Spain, formerly famous for its manufacture), and some portions of the hide making a fine, soft leather. The American bison hide somewhat resembles that of the Calcutta buffalo, but does not make as solid sole leather. The supply of these hides has been about half a million a year since 1871, but they will probably cease to furnish material for leather in a very few years. Hog skins make the best saddle-seating, but more imitation hog skin is sold for this purpose than genuine. Sheep skins, of which the supply is very large, furnish probably more kinds of leather than are derived from any other source. The leather has but little strength and no solidity, but it is quickly tanned, generally with alum or sumach, and worked up whole or split, and serves for the cheaper kinds of pocketbooks, bookbinders' leather, shoe linings, hat linings, and a thousand cheap articles; it is also made up into imitations of many other kinds of leather; and since the introduction of aniline colors, which have been very successfully applied in its manufacture, its uses seem to be almost endless. Goat skins make a stronger, closer-textured leather than sheep skins; this leather, called morocco, furnishes the principal material for ladies' fine shoes. Deer skins are largely used to make what are known as buckskin gloves and mittens, and this leather is often sold for chamois or white leather. The principal sources from which hides for tanning are obtained, besides those which are always available in every locality from the slaughter of cattle in the neighborhood, are the prairies of the west

and southwest, principally Texas, New Mexico, and Kansas; Mexico, Central America, the pampas of the country tributary to the Plata river in South America, and various portions of India and Africa. The hides taken off in the United States are nearly all tanned here. The product of Mexico, Central America, and the river Plata is principally sold at New York and Boston, London and Liverpool, Hamburg, Antwerp, Havre, and to a less extent at a few ports on the Mediterranean. The product of India and Africa is principally distributed through the same markets. East India kips form a prominent feature of the English leather market. It is estimated that the total supply of domestic hides of all kinds used in the leather manufacture of the United States amounts to about 7,000,000 annually. Of the imported hides and skins used in the American leather manufacture, fully four fifths are entered at the ports of New York and Boston. The imports at New York from 1869 to 1873 were as follows:

FROM	1869.	1870.	1871.	1872.	1873.
Buenos Ayres.	1,009,876	770,748	767,716	581,455	325,886
Montevideo. . .	363,135	406,963	640,500	442,079	379,179
Rio Grande. . .	815,250	467,565	447,226	368,564	243,214
Other foreign ports. . . . .	550,685	588,299	610,781	451,910	366,925
Total. . . . .	2,243,446	2,288,570	2,466,223	1,839,008	1,316,704

The total imports of the whole country for the above mentioned period may be roundly estimated at from 500,000 to 700,000 more than these figures for each period named. It must be remembered, however, that this table does not include any portion of the imports of lighter stock commonly classed as skins. The imports of goat skins at the principal markets for the years 1871-'3 were as follows:

PORTS.	1871.	1872.	1873.
New York . . . . .	3,200,000	3,600,000	3,800,000
Boston . . . . .	2,100,000	1,350,000	1,200,000
Philadelphia . . . . .	500,000	250,000	240,000
Baltimore. . . . .	50,000	75,000	175,000
Total . . . . .	5,850,000	5,275,000	4,915,000

Liverpool is the principal hide market of England, and here most of the imports of hides from South America arrive. English tanners generally take the choicest selections of heavy hides for sole leather. The following table shows the receipts at that port for seven years:

YEARS.	Buenos Ayres and Montevideo.		Rio Grande.		Brazil.	West Coast and Central America.		North America.	West Indies.	East Indies.	Horse hides.	N'found-land seal skins.
	Dry.	Salted.	Dry.	Salted.		Dry.	Salted.					
1867. . . . .	12,814	295,084	825	58,804	68,825	5,658	697	106	608	122,800	60,965	150,000
1868. . . . .	1,690	373,240	2,999	75,958	69,955	9,568	....	2,742	393	171,050	192,054	98,600
1869. . . . .	4,948	807,524	1,400	42,592	70,118	9,014	....	7,050	710	184,290	86,011	158,900
1870. . . . .	27,781	411,267	6,208	76,982	104,737	25,618	6,955	16,702	3,694	418,600	59,820	138,000

1873. . . . .	40,547	405,887	1,200	19,962	73,822	22,648	5,125	258,417	29,784	396,155	87,645	161,000

The importations of hides at London are not more than one fourth as large as those at Liverpool, but in both places there is a considerable business in "market" hides, as those from domestic cattle are called. The most important hide market on the continent of Europe is Antwerp. A summary statement of the trade there for the five years ending with 1873 shows the business in South American hides to have been as follows :

	Imports.	Exports.		Imports.	Exports.
1869...	925,838	250,182	1872..	1,181,418	250,619
1870...	1,188,222	235,074	1873..	1,523,951	421,792
1871...	1,068,223	277,897			

The difference between the exports and imports shows the number of hides, nearly all for the manufacture of heavy leather, which are supplied from this port for the use of German tanners. The calf skins used by the French and German tanners are nearly all furnished from domestic stock; as a rule, all animals are better cared for there than here, and the skins are more carefully taken off, which affords a partial explanation of the superior quality of French and German finished calf skins.—*Tanning Materials.* Tannic acid is found in almost every plant which grows, and its use in making leather dates back as far as we have any records, and is attested in every sample of ancient leather extant. Among the sources of tannic acid, oak bark has the first place, although in the United States the bark of the hemlock is used even more than that of oak. Hemlock bark makes red leather, because of an excess of coloring matter, from which oak bark is comparatively free. Oak-tanned leather always brings a higher price than hemlock-tanned, because the coloring matter and resin which are to some extent imparted to the latter have a tendency to make it harder and more brittle, and also because of a prejudice against the red color, pure oak leather being often nearly white; but these points are not of so much importance as the fact that, because oak bark costs more, greater care is taken in the selection of the hides and the finishing of the leather. As for the astringent principle of the bark, which unites with the gelatine and fibrine of the hide to constitute leather, there is no difference between that in oak and that in hemlock bark. The same cannot be said of all tanning substances, for chemists have not yet very closely defined what tannic acid is; and while leather tanned with terra japonica, and some other kinds of concentrated tanning materials, may be restored to a condition very similar to that of raw hide, this cannot be done with bark-tanned leather. To make an accurate analysis of the amount of tannic acid in any given substance is one of the most difficult of chemical experiments; and the results of analyses made by different individuals, and even by the most celebrated chemists, vary so widely that the best informed tanners place

no dependence on the figures thus given. The following table embraces all the principal tanning agents now in use, and is arranged with especial reference to the characteristic qualities that each is conceded to have in the leather manufacture; that is, those coming first in the list, before oak bark, make soft, open, mellow leather, and those which follow oak bark make leather more plump, hard, and brittle. The figures given as showing the percentage of tanning cover only the variations found in excellent samples of the same material:

TRADE NAME.	Percentage of tannin.	Characteristics.
Terra japonica.	42 to 50	Color bad; makes little weight; leather soft and open.
Sumach .....	24 to 33	Color light; gives some firmness; makes leather soft and pliable.
Myrabolams ..	28 to 44	Color yellow; makes little weight; leather mellow.
Oak bark .....	11 to 13	Nearly colorless; gives good weight; makes leather very firm and sold.
Hemlock bark.	11 to 13	Color red; gives good weight; makes leather firm and hard.
Valonia .....	34 to 40	Color fair; gives weight; makes leather hard.
Dividivi .....	26 to 50	Color poor; gives great weight.
Mimosa bark ..	24 to 36	Color very red; gives weight; makes leather hard and brittle.

Of the above named tanning materials, a comparatively small amount is used in the American leather manufacture of any except oak and hemlock bark, and sumach, which is used principally in the tanning of goat skins. Hemlock bark is generally found north of the central portion of Pennsylvania, while south of that latitude most of the oak bark is used. In the northwestern counties of Pennsylvania, the northern counties of New York, W. and N. of Lake Michigan, and in Maine and Canada, are now found the principal hemlock forests, which it is estimated will furnish ample tanning materials for at least 50 years to come. Along the Cumberland and Alleghany mountains, and all the lesser ranges of the Blue Ridge through the southern states, are large supplies of oak bark. Maryland and Virginia since 1865 have furnished a large amount of sumach, which, however, is not so highly esteemed as that grown in Sicily, whence considerable importations are made annually. Besides the bark used directly for tanning at or near the localities where it is peeled from the tree, no inconsiderable amount is used in the United States and Canada for the manufacture of bark extract. This is a process of leaching the bark and then evaporating the principal portion of the water, so that a concentrated solution of tannin is made, which may easily be shipped to distant tanneries; and much of this extract has found a ready market in England within the past five years. It has been a favorite idea with some who are well informed in the business that this trade will ultimately be very large, as oak bark costs in England from £6 to £7 a ton, and the cost of the extract delivered there is only about half as great; but prac-

tical difficulties have thus far prevented the expected growth of this business. The following table represents the imports of the principal tanning materials at Liverpool, England, from 1867 to 1873 inclusive:

YEARS.	Mimosa bark.	Valonia.	Dividivi.	Gambir.
	Tons.	Tons.	Tons.	Tons.
1867.....	....	3,060	1,500	4,586
1868.....	....	12,727	2,845	6,918
1869.....	700	9,250	2,866	5,676
1870.....	1,200	10,450	1,251	8,917
1871.....	2,500	11,690	3,000	7,953
1872.....	1,600	14,216	4,613	9,584
1873.....	1,500	10,016	2,200	7,582

These tanning agents all make cheaper leather than is made with oak bark, and one which is inferior also to that made with hemlock bark; and many devices are resorted to, in the composition of the different tanning agents, and in the process of manufacture, to give the leather a bark-tanned appearance. When the work is skilfully done, the leather is of most excellent quality. On the continent of Europe copice, spruce, and willow bark, as well as the wood of the chestnut, are used for tanning; but these substances have very little tannic acid, and the small home supplies of oak bark, with importations of the above named materials and sumach, constitute the principal agents for converting raw hide into leather. Many other substances besides tannic acid may be used to preserve hides and skins and fit them for certain uses; but these do not make leather which will resist moisture or retain its flexibility and softness after frequent wetting. The most extensively used of these is alum, so that the term alum-tanned leather has become a common designation both in Europe and the United States. With this agent is tanned a large proportion of the sheep skins, and lighter glove leathers from deer, lamb, kid, and other skins.—*Tanning.* As the making of sole leather involves the placing of the greatest amount of tannic acid in the hide, this branch of the business most requires a thorough knowledge of the principles of tanning; for in the manufacture of upper leather as much depends upon the currying and finishing of the stock as upon the tanning, and it is not sought to put the greatest possible amount of tannin in the hide. The hide or skin is composed of two parts: the epidermis or cuticle, in which the hair is imbedded, and the corium or cutis, the true skin, made up of numberless fibres interlacing in every direction, the interstices being filled with a matter which renders the skin flexible, and renews the substance of the cuticle, and which, as well as the fibres themselves, is shown to be almost pure gelatine. The chemical analysis of dried skin is as follows:

Fibrous matter.....	74.42
Uncoagulated albumen.....	3.49
Extractive matter soluble in water, insoluble in alcohol.....	17.44
Extractive matter soluble in alcohol.....	2.82
Fatty matter and loss.....	2.83

The object of tanning is to combine this fibrous and gelatinous matter with tannic acid, and the first process is to wash and cleanse the skin, making it thoroughly soft, and as nearly as possible in the condition it was when taken from the animal. For this purpose the hides are first placed in "soaks," or vats of pure water, where they remain from five to ten days if dry, and about 24 hours if green. Much depends upon the condition of the hide. A dry hide which has been imperfectly cured could not be permitted to remain so long in the soak, as it might begin to decay. When the hide is thus softened, it is ready for the treatment which is necessary to remove the hair. For this purpose there are two principal methods, of acknowledged efficiency and in almost universal use, besides scores of other methods which have their advocates, but have never been generally adopted. The object is so to soften and swell the hide on the surface, where the roots of the hair are imbedded, that the hair can be easily and quickly removed, and the condition of the hide remain as nearly as possible unaltered. To effect this, liming and sweating are the principal methods; the former being used almost altogether for upper leather, and largely for sole leather, and the latter almost exclusively for sole leather. Great differences of opinion exist as to the amount of lime which should be used; if the lime vat is very weak, a longer time is required to swell the epidermis so that the hair can be easily removed; and if more lime is used, there is danger of burning. The true theory is that the lime shall remove all but the gelatine and fibrine; and in upper leather, as well as in belting and harness leather, the removal also of a portion of the gelatine by the lime tends to make a more flexible leather, with all the strength and toughness that it would have with all the gelatine of the hide remaining to unite with the tannic acid, but with less solidity. The sweating process for the removal of the hair is used in the United States and in Germany on nearly all sole leather stock. In Germany and England the warm sweat is generally followed, and in the United States the cold sweat; the former being at a temperature of about 100° F., and the latter from 50° to 65°. The hide after the soaking is cut through the middle of the back, if intended for sides, as is usual in America, or is rounded by cutting off the pates, bellies, and flanks, if to make butts. It is then generally put into a hide mill, to further soften it and help to loosen the hair. This hide mill is a simple contrivance, with two arms working in a box to pound the hides, on which a small stream of water is kept flowing. For the cold sweating process the hides are hung in a close vault, and here it is necessary to watch them very narrowly, as the change which has been commenced in the soaks proceeds much more rapidly here. The sweat pits are nearly all under ground and dark (though the light is proved to be not detri-

mental to the process), and the air is heavily charged with moisture and the ammonia from the hides. The time required to loosen the hair is from one to six days, according to the condition of the hide; but it is of great importance that the hide be removed as speedily as possible after the hair will slip, as it is then in the incipient stages of a very rapid decay. From the sweat pit the hides are first milled, with the water running on them, to soften them further and remove the hair, and then worked over a beam, to take off any remaining hair; they are also, by the more careful tanners, worked on the flesh side to take off any extra flesh or fatty matter which butchers almost always leave on, and then thoroughly rinsed. By the warm sweating process the same ends are obtained, and in about the same time, though it is with greater danger from more rapid decay in unsound hides. Another object to be attained in this stage of preparing the hide is the swelling or distending of its fibres, to allow of the free admission of the tannin to combine with the gelatine in the cells. When lime is used to unhair, it opens the pores of the hide very effectually, but the lime itself must also be thoroughly removed afterward; this is most commonly done by soaking the hide in what is called a *bate*, made of hen dung or similar excrement, aided by subsequent thorough washings in water. The swelling of the hide to allow the tanning liquors to enter the pores freely has no little influence in determining the quality of the leather. Some means to effect this are always necessary in tanning hides which have been un-haired by sweating. There are two methods generally followed in America in preparing sole leather, which illustrate the principles adopted by all tanners. These are commonly called the "acid" and "non-acid" processes. In both methods it is acid that plumps the hide and distends its fibres for the reception of the tan liquor; in the former process, however, a mineral acid is used, either alone, with a large proportion of water, or in connection with more or less of the vegetable acid furnished by the old, sour liquors, to hasten the process of preparing the hides for the tanning proper; while by the latter process the hides, after being un-haired, are handled for several days in the old, sour liquors, but without the aid of the mineral acid (which almost invariably consists of vitriol or sulphuric acid), to effect the same object, that is, distend the fibres and open the pores. In using the vitriol, great care must be observed in the first stages, or the leather will be very dark, and have what is called a very poor grain, *i. e.*, will not make a light-colored bottom for boots and shoes, an object which is very much sought after in all sole leather. The leather is also more likely to be hard and brittle than that prepared by the non-acid method. The old liquors used in the latter method are simply the tanning liquors which have become weak by use, and

in which the remaining tannic acid has largely been changed to gallic acid by exposure to the air.—The grinding of the bark and the making of the liquors therefrom is a most important part of the work. The bark is stripped from the tree and cut in pieces 4 ft. long; a month or two is generally sufficient to make it dry enough to grind, though if kept two years in a large, close pile, and not much exposed to wet, it will not be materially injured. It is ground in a large mill, not unlike a coffee mill in principle; and about the size of a grain of wheat is considered the proper degree of fineness. To get the tanning principle from the ground bark, leaching with hot water is prejudicial, for in that way resin and coloring matter are also extracted; and leaching with cold water does not extract all the tannin. Both modes are used. Leaching with hot water, or swelling the ground bark with steam before leaching, causes the leather to be darker than that made with liquors which are leached cold.—The vats in which the hides are handled and laid away in tanning are of various sizes, either large enough for whole hides or for sides, and are about 6 ft. deep. In handling, the hides are sometimes sewed together at the ends, so that they can be reeled from one vat to another; but this is only to facilitate the work in the frequent changes which have to be made. For the first few days the hides are changed every two or three hours from one liquor to another, the first liquors being very weak, and the last liquors in which the hides are thus handled, at the end of 10 or 15 days, having 10 or 12 degrees of strength. From the handlers the hides are placed in what are called *layaway vats*, a shovelful of ground bark on the top of each hide, and the whole covered with the bark liquor. It is the custom in America thus to lay away the leather in vats six or seven times, the liquors of the first layaway being the weakest, and the time the leather is allowed to remain, as well as the strength of the liquors, being increased with each successive laying away. For the first layaway a liquor of 10 or 12 degrees would be used, and the time would be from one to two weeks; for the second, 15 to 20 degrees, and two to three weeks; for the third, 20 to 22 degrees, and three to four weeks; for the fourth, 24 to 26 degrees, and four to six weeks; for the fifth, 28 to 30 degrees, or stronger, and the time in this layaway, or for the sixth and seventh, depends on the judgment of the tanner, the quality of the hide, and the kind of leather to be made. This process, taking about four months, is a fair average of time consumed in America for the actual tanning part of ordinarily heavy hemlock sole leather. Oak tanners generally lay away the leather in bark and strong liquors for a little longer period, and this is also done with all extra-heavy hides. The leather is also much more advanced in the handlers in some cases, and on the proper and thorough opening of the pores here, and the

exercise of great care to prevent the tanning from going on too rapidly on the surface, depends the question whether a longer laying away in the bark liquor will add to the weight of the leather. The object in all sole-leather tanning is to get as great weight as possible, where this can be done without detriment. From dry hide about 170 lbs. of leather are made of 100 lbs. of hide; in some cases the writer has seen 195 lbs. of leather made from 100 lbs. of hide; but many poor tanners will make as low as 140 to 150 lbs. In tanning green or wet hides, from 45 to 60 lbs. of leather for 100 lbs. of hide represents about the average production.—The common prejudice that quick tanning is necessarily poor tanning has no sufficient foundation. The best English tanning, many years since, occupied from nine to 18 months, but the great majority of English tanners now tan in from four to six months. They are also, where *valonia*, *dividivi*, *myrabolams*, and *terra japonica* are used, able to make good leather in even a much shorter time. The problem is to feed the tannin as quickly as possible, without too much expense, to every cell and interstice of the hide; and by constant handling and agitation of the hide in liquors of the proper strength and proportioned to its condition, the work which formerly occupied months is now done in weeks, and could be done in days or even in hours if the extra expense incurred in this way were not greater than the profit to be derived from thus expediting the process. Among the many ways of quick tanning proposed, and which have found no small favor in the trade, are the vacuum process for sole and upper leather, and the revolving wheel or drum for upper leather and calf skins. The former proceeds on the principle of pumping out the air, as from a receiver, from the vat in which the hides are placed, and then letting in the tanning liquors; it is asserted that the pores of the hide are then more open, and the tannin will be more quickly taken up. The wheel or drum for upper-leather and calf-skin tanning is a box nearly filled with a strong tan liquor and the skins, and made to revolve on a shaft, thus constantly agitating the skins, and producing an opening of the pores which facilitates the absorption of the tannin. Neither of these methods, however, has been generally adopted, though each has found favor and is used to a limited extent.—After the leather comes from the last layaway vat, it is scrubbed with a coarse brush, operated either by hand or power, and hung up to dry. Care must be taken at this stage not to hang up the leather where there is too much light, which gives a dark color, and also to have as far as possible a constant circulation of dry air. After drying, the leather is "sammied," as it is called, or slightly moistened and oiled on the grain side, by which it is brought to a flexible, mellow condition, ready to be rolled or hammered, the final process of finishing. In America and

England all sole leather is rolled, while in France and Germany it is generally hammered. The sole leather roller commonly used is of brass, about 5 in. in diameter and from 7 to 9 in. long; it is hung like a pendulum over a solid metal bed with a concave face, in which the roller is worked by means of an arm attached near the lower end. The desired pressure is attained by means of a treadle which raises the bed. A rubber packing is sometimes used under this bed to prevent the pressure from coming too hard upon parts of the side or hide which may be naturally too thick or plump to receive the tremendous weight which can be brought upon it.—In making belting and harness leather, where greater flexibility and the greatest possible tensile strength are sought, the methods of tanning are not essentially different. There is very little difference in the texture and appearance of leather which will wear best for the soles of boots and shoes, and that which will serve best for band leather; and most of the heavy harness leather, if well stretched and finished with less oil or stuffing, would make good belt leather. But in the best belt leather, the original fibre of the hide must be as little disturbed as possible. An examination with a microscope of the edge of an ordinary piece of sole or belting leather will show how these fibres are interlaced; and, when not disturbed, this constitutes the great strength of a raw hide. In the tanning and finishing of harness leather, the object is to make the stock still lighter than belting leather, and also to give it much more body and strength than any leather which is to be used for the uppers of boots and shoes. With this end in view, the hides are kept longer in the lime, by which more of the gluten is exhausted, and a higher degree of care is consequently necessary to insure the thorough working out of the lime, which would cause the leather to crack, or be hard and brittle.—In the tanning of upper leather and calf skins the time occupied is very much shorter than that used in making sole leather, and the processes embrace a great variety of methods of handling, agitating with a wheel, suspending in vats of tan liquors, &c. Greater care is necessarily taken in selecting and fleshing the skins; and if the lime used to unhair is not thoroughly worked out, the leather will crack quickly. The currying consists in the thorough working of the skins to soften them, blacking, and thoroughly incorporating the oil and tallow used for stuffing. The latter is generally done in a wheel heated by steam. The blacking is usually of oil, lampblack, and tallow, with a little tan liquor; a cheaper blacking is made of sal soda, lampblack, and soap. Leather finished on the grain or hair side is called grain leather; and imitation grain is made of split leather, which is worked by hand or machine to give its surface the rough look always found on leather finished with the natural appearance on the hair side. Buff leather is where this surface is smoothed off. "Leath-

er board," made of leather skivings and old rope, is manufactured for use in heels, stiffenings, and counters of the cheapest boots and shoes.—Japanned leather, generally called patent leather, was first made in America by Seth Boyden of Newark, N. J., 1818-'20. A smooth, glazed finish was first given to calf skins in France, which were sold to a considerable extent in the American market; but the manufacture of japanned leather has now grown to be a large business in Newark, and the amount of these goods imported is very light. The japanning of calf leather for boots and shoes is most successfully conducted by the French. They furnish the best of the highly glazed brilliant material known as patent leather, and large quantities were formerly produced in the United States. Of late the demand for the finer kinds of calf patent leather has largely fallen off, and its place is in some measure filled by a cheaper article manufactured mostly of kips or larger hides, split or skived down to proper thickness. It is curried expressly for this purpose, and particular care is taken to keep it as free as possible from grease. The skins are then tacked on frames and coated with a composition of linseed oil and umber, in the proportion of 18 gallons of the former to 5 oz. of the latter, boiled till nearly solid, and then mixed with spirits of turpentine to the proper consistency; lampblack is also added when the composition is applied, in order to give color and body. From three to four coats of this are necessary to form a surface to receive the varnish; they are laid on with a sort of knife or scraper. To render the goods soft and pliant, each coat must be very light and thoroughly dried between each application. A thin coat is afterward applied of the same composition, of proper consistence to be put on with a brush, and with sufficient lampblack boiled in it to make it a perfect black. When thoroughly dry it is cut down with a scraper having a turned edge, when it is ready to varnish. The principal varnish used is made from linseed oil and Prussian blue, boiled to the thickness of printers' ink. It is reduced with spirits of turpentine to a suitable consistence to work with a brush, and is then applied in two or three separate coats, which are scraped and pumiced until the leather is perfectly filled and smooth. The finishing coat is put on with especial care in a room kept closed and with the floor wet to prevent dust. The frames are then run into ovens heated to about 175°. In preparing this kind of leather the manufacturer must give the skins as high a heat as they can bear in order to dry the composition upon the surface as rapidly as possible without absorption, and cautiously so as not to injure the fibre of the leather.—Enamelled leather, now used for carriage tops, was first manufactured by David Crockett of Newark; previous to this, oil-dressed leather, presenting all the appearance of harness leather, was used for this purpose. This leather is all split by machine, and only

large hides are used. By the use of the leather-splitting machine, a hide is split in three or four parts, and what in the old process of shaving would have produced but 50 ft. of leather, is increased to about 125 ft. suitable for glazing, besides a first split that is used for covering trunks. Patent leather differs from enamelled leather in the fact that the former has a smooth surface, and the latter is finished with less composition, leaving the irregular surface given by the natural grain of the skin where the hair has been removed. In enamelled leather American manufacturers take the lead of all others, but they also make much poor stock. The principal cause of complaint against American enamelled leather has arisen from the introduction of powerful stretching machines, by which the size of the hide can be increased from 3 to 7 sq. ft. (The leather is sold by measure, not by weight.) The wet leather is thrown over a bar which is attached to uprights and can be raised or lowered at will; the edges of the hides are attached to a fixed bar, and by the use of two jack screws the movable frame is raised until the leather is stretched to its utmost. The whole frame is then wheeled into a dry room, where it remains until the leather is perfectly dry, after which it passes through the usual process of blacking and varnishing. Hides treated in this way will shrink more rapidly than those stretched in the usual manner; they will even contract if spread out in the ware-room. Smaller hides are now used for this purpose than formerly, as they retain the enamel surface better owing to their finer grain, and do not shrink so much when exposed to the weather.—Alligator leather was first made about 1855 in New Orleans. In 1870 a much better article was made in Massachusetts, the tanning process occupying about eight months, and a number of firms then engaged in the business. The leather thus made was very costly, and while it was not impervious to water, as was asserted, it had not sufficient firmness to retain its shape when made up into boots and shoes, but would spread out, in ordinary wear, as would be the case with a buckskin upper of a boot or shoe. The irregular and conspicuous checkered pattern of their surfaces made them popular for a brief period; but nearly all of the durable boots of this kind were made with a lining of calfskin, thus rendering them extremely heavy. In preparing the skins for tanning, great care is necessary to prevent the rotting of the tender crevices between the scales; and, as they must be very carefully treated, twice as much time is required for the tanning and finishing as with calf skins. The skins of the young animals only are fitted for making leather, as the hide of a full-grown alligator is too hard and horny to be of any value. The tanning of alligator skins is, in other respects than those mentioned, similar to that of calf skins. The back of the skin, which is always hard and horny, is generally cut out before shipment, leaving only

about two thirds of the whole for use.—Russia leather, such as is used in pocketbooks, travelling bags, &c., has long been highly popular in the United States and Europe, not only for its durability, but more especially for its peculiarly pleasant smell, which it retains after years of use and exposure. For these reasons it has always commanded a high price, and many American manufacturers have striven hard to make a close imitation of the genuine article. The leather is made of the ordinary Russian hides, which, as is the case in all cold climates where the pasturage is generally poor, are large and thin. These hides are tanned by a very slow process, generally in the weak liquor of the willow bark, which contains not more than 2 or 3 per cent. of tannin. The leather has very little of the positive bark smell which may always be noticed in more thorough or more rapid tannages; but to give it the particular odor by which it is distinguished, what is called "birch bark tar" is used. The exact manner of using this tar, which is said to be simply a condensed extract of birch bark, is held as a secret by the principal manufacturers in Russia, each one of them having especial modes of their own; but it is certain that they all depend upon this as the means of giving the peculiar odor which characterizes Russia leather. The willow bark used in tanning gives a different color from any other tanning material, and it is supposed that in the finishing process the leather is laid away, after a liberal application of the birch bark tar, to become thoroughly impregnated with its peculiar odor.—The importance of the leather industry in the United States, considering the amount of capital and labor employed in all its departments, is next to that of agriculture. It is doubtful whether it holds this relative position in England, where the iron and cotton and wool interests are so large, or on the continent of Europe, where the consumption of leather in proportion to population is much less than in the United States. In all other parts of the world besides the United States and British North America, the British islands, eastern and southern Europe, and Australia, the production of leather is comparatively very small, and the product inferior; the raw hides and skins from the excluded sections form no small proportion of the stock from which leather is made in the countries named. The most complete statistics of the leather industry of the United States yet gathered were presented to congress in 1870, as made by Special Revenue Commissioner David A. Wells. The values created by the leading industries are computed as follows: agriculture, \$3,282,950,000; railroad service, \$360,000,000; leather manufactures, \$222,600,000; iron production, \$119,950,000. The value of leather tanned and of leather manufactures, the number of hands employed, and the amount added by labor to the value of the products, are given as follows:

Value of leather tanned and dressed.....	\$124,760,069
Deducting value of hides and skins used as raw material .....	66,581,114
Value added by labor.....	\$58,228,955
Value of boots and shoes produced .....	\$246,252,000
Deduct value of all materials used, including leather.....	180,169,008
Added value of boot and shoe industry.....	\$116,082,992
Value of other manufactures of leather, harness, hose, belting, bags, portemonnaies, &c. ....	\$69,300,000
Deduct value of materials, including leather.	15,000,000
Added value of above industries.....	\$48,300,000
Number of hands employed in the manufacture of leather.....	80,000
Employed in manufacture of boots and shoes .....	181,838
Employed in other manufactures from leather.....	19,000
Total .....	180,888

## RECAPITULATION.

Value added to hides and skins in the manufacture of leather.....	\$58,228,955
Value added in manufacture of boots and shoes .....	116,082,992
Value added in other manufactures from leather.....	48,300,000
Total added value.....	\$222,611,947

The value of product in the manufacture of leather is apportioned as follows:

Raw material.....	\$66,581,114
Supplies and repairs.....	24,328,955
Labor .....	20,000,000
Capital.....	18,900,000
Total .....	\$124,760,069

The value of the product of the boot and shoe industry is apportioned as follows:

Raw material.....	\$180,169,008
Supplies and repairs.....	9,873,959
Capital .....	24,625,000
Labor .....	52,058,438
Total .....	\$246,252,000

The above statistics were made on a basis of currency prices, with gold at 25 per cent. premium. By far the larger proportion of the industry to which these figures relate is carried on east of the Alleghany mountains; and while the leather manufacture is of no slight importance in Kentucky and the states north of the Ohio, comparatively little is done in this business anywhere on the Pacific slope. The leather made in all the New England states, and a large portion of that made in New York, finds its principal market in Boston, which is the leading upper-leather market in the United States, and does a large business in sole leather. The following comparative statement, including receipts from New York city, and receipts of rough leather which is sent again to the tanneries nearer Boston to be finished, and thus appears twice in the receipts, represents the business of that city:

TOTAL RECEIPTS, 1863-1873.

	Sides.		Sides.
1863.....	2,700,000	1869.....	3,700,000
1864.....	2,600,000	1870.....	4,000,000
1865.....	3,400,000	1871.....	4,700,000
1866.....	3,600,000	1872.....	5,400,000
1867.....	3,400,000	1873.....	5,600,000
1868.....	3,700,000		

New York is the principal market for sole leather and imported calf skins, kids, &c. Nearly all the sole leather received there is hemlock-tanned, which probably constitutes three fifths of the leather tanned in the United States. The receipts of sole leather at New York for the year 1873 were about 4,500,000 sides, and for 1872 not less than 5,000,000 sides. Philadelphia does a large business in oak sole and domestic tanned and finished calf and goat skins. Baltimore and Cincinnati are of considerable importance as oak-leather markets. Buffalo and Chicago have each a large trade in hemlock leather, and are supplied by the tanneries in their immediate neighborhood. There are some considerable tanneries of hemlock leather in Canada and Nova Scotia, the leather finding its market mostly among the shoe manufacturers there; the remainder is principally exported to England. Very little of it comes to the United States, owing to the tariff, which was formerly 25 per cent., and is now (1874) 10 per cent. on sole leather. Since 1840 American tanners have frequently attempted to supply the English market with sole leather. The hemlock bark principally used for tanning in the United States costs from \$4 to \$6 a cord, weighing about 2,000 lbs. The English oak bark costs about \$30 a cord, and the amount of tannin it contains is very little greater than that in American hemlock of average growth. As the cost of bark is a leading consideration in the leather manufacture, and the difference in the cost of labor was not very great, it was thought that the American tanner had a very decided advantage over his English competitor. Yet it has taken many years of experiment for the American tanner to obtain any considerable degree of success in this matter. Shipments have not been successful until within the past two or three years, or since the removal by congress, from Aug. 1, 1872, of the 10 per cent. duty on foreign hides brought to the United States. English manufacturers at first complained that American hemlock leather, being red, was not tanned, but only colored; then that American leather was not so neatly finished, fleshed, and trimmed as that of English make; and this still holds good, so that American hemlock leather, although its substantial qualities are now recognized by the leading English manufacturers of boots and shoes, is sold there only as an article inferior to their best leather, and at a much lower price, but better than the poorer qualities of which the greater portion of their production consists. The following

are the shipments of sole leather from New York to various ports for 1873:

To Liverpool.....	885,756 sides.
" Hamburg.....	218,152 "
" Bremen.....	43,372 "
" London.....	82,448 "
" St. John's.....	3,852 "
" Curaçoa.....	8,984 "
" various ports.....	20,254 "
Total.....	707,919 "

During the year ending June 30, 1873, \$4,612,-885 worth of leather was exported from the United States, and \$6,766,202 imported. About three fourths of this commerce passes through New York.—The leather manufacture of Great Britain is one of its most important industries. English sole leather has long had the reputation of being the best in the world, and its better grades are superior to any other manufactured, if we except a few tannages of similar leather made in the United States. With the increasing demand for leather, however, and the diminishing supply and advanced prices of bark, a poorer quality has largely taken the place of the prime leather which gave English tanners their extended reputation. The following extracts from the latest government returns show the imports and exports:

IMPORTS.

ARTICLES.	1873.		1872.

The principal leather market of Great Britain is at Leeds, and at the quarterly and intermediate fairs held here representatives of the principal tanners and leather and hide factors of Great Britain are always to be found. London and Liverpool are also extensive markets. Bristol, Manchester, and Newcastle have each a large business in leather and the shoe manufacture.—On the continent of Europe the sole-leather manufacture is of minor importance, compared with the extent of the industry in England and America, while the manufacture of calf skins, kips, kid skins, morocco, and all kinds of upper leather, is carried on very largely and with great success. The sole leather tanned on the continent of Europe is generally hard and brittle, from an insufficiency of tanning material, and a long process of tanning; but the calf skins and upper leathers, which require but

little tanning material and much hand labor in working, are as a rule far superior to those made in England and America. For this reason, the two latter countries are large customers for these goods, and export in return a large proportion of the sole leather used in Europe. Paris is the headquarters of the French calf-skin business, and Milhau is the most important manufacturing centre of the trade in France. At Lyons, Nantes, and Chaumont near Beauvais, the trade is also of considerable importance. In Belgium, at and near Brussels, there is quite a large production of calf skins. Switzerland, besides numerous small tanneries, has one of the largest calf-skin tanneries in the world, at Lausaune. In Germany, calf skins, calf kids, and kips are made in large quantities at Mentz, Worms, Oppenheim, Offenbach, Dresden, near Frankfort, and near Freiburg, besides innumerable small tanneries everywhere.

**LEATHES, Stanley**, an English theologian, born at Ellesborough, Buckinghamshire, March 21, 1830. He was educated at Jesus college, Cambridge, ordained in 1856, and successively curate of St. Martin's, Salisbury, St. Luke's, Berwick street, London, and St. James's, Westminster. In 1863 he was called to King's college, London, as professor of Hebrew; and in 1869 he became minister of St. Philip's, London. He has published able defences of Christian orthodoxy, including "The Witness of St. John to Christ." Several of his apologetics were originally delivered from 1868 to 1870 as Boyle lectures at Whitehall, and in 1873 as Hulsean lectures at Cambridge. In 1874 he held the appointment of Bampton lecturer at Oxford, an honor never before accorded by Oxford to a Cambridge graduate. He is a member of the Anglican revision company of the Old Testament. In the conference of the evangelical alliance in New York in 1873 he was prominent.

**LEAVENWORTH**, a N. E. county of Kansas, bounded N. E. by the Missouri river, which separates it from Missouri, and S. by the Kansas; area, 460 sq. m.; pop. in 1870, 32,444. The surface is undulating, diversified with prairies and timber lands; the soil is fertile. The Leavenworth branch of the Kansas Pacific railroad traverses it, and it is also crossed by the Kansas Central and the Missouri Pacific railroads. The chief productions in 1870 were 31,647 bushels of wheat, 1,133,188 of Indian corn, 193,851 of oats, 295,980 of potatoes, 14,380 lbs. of wool, 254,837 of butter, and 19,796 tons of hay. There were 4,480 horses, 4,701 milch cows, 8,007 other cattle, 3,406 sheep, and 17,435 swine; 11 manufactories of carriages, 10 of clothing, 8 of furniture, 2 of iron castings, 1 of machinery, 4 of marble and stone work, 9 of saddlery and harness, 2 of soap and candles, 6 of tin, copper, and sheet-iron ware, 16 of cigars, 5 breweries, 3 flour mills, and 8 saw mills. Capital, Leavenworth.

**LEAVENWORTH**, a city of Kansas, the largest in the state, county seat of Leavenworth co., situated on the right bank of the Missouri

river, 500 m. above its mouth, 25 m. N. W. of Kansas City, Mo., and 45 m. N. E. of Topeka; pop. in 1860, 7,429; in 1870, 17,873, of whom 4,510 were foreigners and 3,024 colored. It is situated in an amphitheatre formed by the Missouri bluffs, which rise to the height of about 300 ft., and sweep round in the form of a crescent, each horn resting on the river. It covers an area of 6 or 8 sq. m., consisting of gentle rolls or slopes, which furnish admirable building sites and afford good drainage. The city is regularly laid out, with streets extending N. and S. and E. and W., which are mostly macadamized and lighted with gas. The business blocks are chiefly of iron and brick three or four stories high, and there are numerous handsome residences and churches, the Catholic cathedral being one of the largest and finest church edifices in the west. Two miles above the city is Fort Leavenworth, the headquarters of the department of the Missouri and the base of supplies for the western posts; it was established in 1827. The government reservation, which extends 6 m. along the river and 1 m. back, affords good landings for steamboats, and contains large and well built barracks, officers' quarters, storehouses, hospital, stables, &c., and a handsome parade ground. There are no fortifications. The city has an important trade by river and railroad. The river is bordered by a paved levee and crossed by an iron railroad bridge. Six lines of railroad centre here, viz.: the Leavenworth branch of the Kansas Pacific; the Leavenworth, Lawrence, and Galveston; Kansas Central; Missouri Pacific; Chicago, Rock Island, and Pacific; and Kansas City, St. Joseph, and Council Bluffs. There are saw mills, breweries, machine shops, founderies, and other manufactories; two national banks with \$200,000 capital, and two savings banks. Leavenworth is the seat of one of the state normal schools and of the state penitentiary. The public schools are graded, including a high school department, and are in a flourishing condition. In 1872 there were 3,700 pupils. Six daily (two German), one tri-weekly, and five weekly (two German) newspapers, and six monthly periodicals are published. There are 26 churches. Leavenworth was settled in 1854.

**LEAVITT, Joshua**, an American journalist, born in Heath, Mass., Sept. 8, 1794, died in Brooklyn, N. Y., Jan. 16, 1873. He graduated at Yale college in 1810, and, after teaching in Wethersfield, Conn., studied law in Northampton, Mass., was admitted to the bar in 1819, and in 1821 began to practise in Putney, Vt. In 1823 he commenced the study of the theology at New Haven, and in 1825 was ordained pastor in Stratford, Conn. The same year he wrote for the "Christian Spectator" a series of articles against slavery. In 1828 he removed to New York to become secretary of the seamen's friend society. In 1831 he became editor and proprietor of the "New York Evangelist," founded to advocate the new

school opinion in regard to revivals; and he reported for this journal the lectures of the Rev. Charles G. Finney, which were republished in England and translated into French and Welsh. The views advocated in the "Evangelist" led to the formation of the New School Presbyterian church in 1837. He aided in organizing the New York anti-slavery society in 1833, and was a member of its executive committee, as well as of that of the national anti-slavery society in which it was merged. He was one of the leading abolitionists who were obliged to fly for a time from the city to escape mob violence. In 1837 he became editor of the "Emancipator," which he removed to Boston in 1841. He there also issued the "Daily Chronicle," the earliest daily anti-slavery paper. From 1840 he endeavored to form an anti-slavery party, and he was the chairman of the national committee of the liberty party from 1844 to 1847, and supported their nominees for the presidency in 1844, 1848, and 1852. In 1848 he became managing editor of the "Independent" newspaper, for which he continued to write until a few days before his death. In 1819 he organized in Heath, Mass., the earliest Sunday school in that part of the country. He was the first lecturer sent out by the American temperance society, and delivered the first temperance lecture ever given in New Haven. He edited a series of school readers which were largely used, and the "Christian Lyre," the first hymn book published in America with the notes attached.

**LEBANON**, a S. E. county of Pennsylvania, bounded N. W. by Kittatinny or Blue mountain, S. E. by South mountain, and drained by Swatara river and its branches; area, 288 sq. m.; pop. in 1870, 34,096. It consists almost wholly of a valley, and has mines of excellent iron ore in connection with rich veins of copper; slate, limestone, and marble also abound. The soil is very fertile. The Union canal and the Lebanon Valley branch of the Philadelphia and Reading railroad, the Lebanon and Tremont, and the Schuylkill and Susquehanna railroads pass through it. The chief productions in 1870 were 538,304 bushels of wheat, 70,188 of rye, 627,881 of Indian corn, 678,614 of oats, 95,835 of potatoes, 569,199 lbs. of butter, and 41,894 tons of hay. There were 6,895 horses, 9,131 milch cows, 11,763 other cattle, 2,687 sheep, and 13,953 swine; 4 manufactories of boots and shoes, 9 of brick, 19 of carriages, 3 of cars, 39 of clothing, 18 of furniture, 15 of iron, 15 of lime, 1 of machinery, 1 of paper, 11 of saddlery and harness, 15 of tin, copper, and sheet-iron ware, 19 of cigars, 4 breweries, 6 tanneries, 4 currying establishments, 1 planing mill, 4 saw mills, and 14 flour mills. Capital, Lebanon.

**LEBANON**. I. A borough and the capital of Lebanon co., Pennsylvania, on Quitapahilla creek, the Union canal, and the Lebanon Valley and Lebanon and Tremont railroads, 24 m. E. by N. of Harrisburg; pop. in 1850, 2,184; in

1860, 4,449; in 1870, 6,727. It is regularly and substantially built, the houses being mostly of brick or stone. It has an active trade, and stands in the midst of a rich iron-mining district. The Cornwall ore banks, 7 m. S., are three hills, called Grassy, Middle, and Big hill, formed of masses of iron ore. Veins of copper are found among the iron, and 6 m. from the borough a quarry of gray marble has been opened. There are several blast furnaces, machine works, a bell manufactory, a rolling mill, a forge, three planing mills, manufactories of paper, organs, stoves, and hollow ware, three national banks with a capital of \$350,000, a state bank, and two savings banks; one daily and six weekly (two German and one English and German) newspapers, a library, 14 churches, and 35 schools. II. A town and the capital of Wilson co., Tennessee, on a branch of Cumberland river, at the terminus of the Tennessee and Pacific railroad, 31 m. E. of Nashville; pop. in 1870, 2,073, of whom 917 were colored. It contains two national banks, manufactories of cotton and woollen goods, and a weekly newspaper. It is the seat of Cumberland university, founded by the Cumberland Presbyterians in 1842, which now embraces preparatory, commercial, engineering, collegiate, theological, and law departments. In 1873-'4 there were 70 preparatory, 104 commercial, 2 engineering, 94 collegiate, 47 theological, and 87 law students; total, deducting repetitions, 352. The whole number of professors and instructors was 12; number of volumes in the library, 6,000. The collegiate department embraces a classical and a scientific course. A post-graduate course has been arranged, upon the completion of which the degree of master of arts is conferred. III. A town and the capital of Marion co., Kentucky, on Hardin's creek, and on a branch of the Louisville, Nashville, and Great Southern railroad, 5 m. from Rolling fork of Salt river, and 43 m. S. W. of Frankfort; pop. in 1870, 1,925, of whom 823 were colored. It contains two banks and a weekly newspaper. It is the seat of Lebanon female college (Baptist), established in 1869, which has 4 instructors and 50 students. At St. Mary's station, about 5 m. distant, is St. Mary's college (Roman Catholic), which has 14 officers and instructors and 108 students. IV. A village and the capital of Warren co., Ohio, on Turtle creek, a branch of the Little Miami river, 30 m. N. E. of Cincinnati; pop. in 1870, 2,749. It contains a saw mill, two planing mills, a public library, and two weekly newspapers. It is the seat of the national normal school, established in 1855, which in 1874 had 17 instructors, 1,606 students, and a library of 3,000 volumes. V. A town of St. Clair co., Illinois, on the Ohio and Mississippi railroad, 23 m. E. of St. Louis; pop. in 1870, 2,117. It is pleasantly situated, and has several stores, mills, two weekly newspapers, and seven churches. It is the seat of McKendree college (Methodist), chartered in 1835, receiving students of

both sexes. In 1874 it had 7 instructors, 67 preparatory and 149 collegiate students, and a library of 8,000 volumes. A semi-monthly periodical is issued by the students.

**LEBANON, Libanus, or Jebel Libnan** (the white mountain), the western of two mountain chains in Syria which are thrown off from the S. E. continuations of the Taurus range, and extend S. S. W. almost parallel with the coast. The eastern of these ridges is called Anti-Libanus, Anti-Lebanon, or Jebel esh-Shurki. The Lebanon is the higher of the two, its average altitude being estimated at 7,000 ft., while its culminating peak, according to Burton ("Unexplored Syria," 1872), is Jebel Timarun, 10,533 ft. high. On its W. side the chain sends off several spurs which traverse the narrow strip of coast, which in antiquity was Phœnicia, and terminate at the Mediterranean in bold promontories. On the east lies the valley of Cœle-Syria, now called El-Bukaa, which separates this range from Anti-Libanus; it is nearly 100 m. long and from 10 to 20 m. wide. It is not properly a valley, because it undulates between elevations of 2,000 and 3,000 ft. S. of it lies the valley of the Jordan, the most important of the rivers of this mountain system. The next largest are the Aasy (the ancient Orontes), which cuts through the Lebanon at Antakia (Antioch), about lat. 36° 7', and the Litany (Leontes), which empties a little N. of Sur (Tyre). The general geological formation of the Lebanon is carboniferous and mountain limestone, the whiteness of which is said to have given to the range its name (Heb. *laban*, white). The rock is very porous, and has been worn by the action of air and water into numerous caves and hollows, which once sheltered the persecuted Jews and Christians. Graywacke, slate, basalt, and other igneous rocks, granite, gneiss, dolomite, iron, and coal are also found. Mines of the last two minerals are worked to some extent. The scenery of the mountains when viewed from the sea or plains is in the highest degree picturesque; but on a nearer approach little is presented to interest the traveller except rugged ravines and dangerous precipices. The vegetation is scanty, although here and there appear pleasant groves, of which the famous cedars of Lebanon form the most remarkable part (see CEDAR), and good pasture grounds to which the Arabs resort in summer. The lower parts of the range, however, are exceptions to these remarks; they are well watered and cultivated, and their valleys contain orchards, vineyards, mulberry plantations, and grain fields. Olives, almonds, oranges, and citrons are also produced, and on the E. side are scrub oaks. The habitable regions of the Lebanon are chiefly in the possession of the Maronites and Druses. (See ANTI-LIBANUS, DRUSES, MARONITES, and PHœNICIA.)

**LEBANON SPRINGS.** See NEW LEBANON.

**LEBAS, Jean Baptiste Apollinaire**, a French engineer, born Aug. 13, 1797, died in 1873. In 1836 he removed the great obelisk of Luxor

from Egypt to the Place de la Concorde, Paris, as described in his *L'Obélisque de Luxor, histoire de sa translation à Paris* (Paris, 1839). He was keeper of the naval museum of the Louvre, and a member of the board of admiralty, retiring in 1858.

**LE BAS, Louis Hippolyte**, a French architect, born in Paris in 1782, died there in 1867. He became architect of public works, member of the institute, and professor at the school of fine arts, and executed many remarkable works, including the church of Notre Dame de Lorette.

**LE BAS, Philippe**, a French archæologist, born in Paris, June 18, 1794, died in 1861. At the age of 16 he entered the navy, which he left three years later for the army. He shared in the campaigns of 1813-'14, and then leaving the service was employed for six years in the office of a magistrate. In 1820 he was chosen by Queen Hortense to act as tutor to Prince Louis Napoleon, the future Napoleon III., with whom he remained till Oct. 1, 1827. After holding professorships at Paris successively of history and of the Greek language and literature, he was commissioned by the government in 1842 to undertake a tour of archæological investigation in Greece and Asia Minor, during which he made many valuable discoveries. His best known works are his *Explication des inscriptions grecques et latines recueillies en Grèce* (1835-'7), and *Voyage archéologique en Grèce et en Asie Mineure* (1847 et seq., but never completed).

**LEBERT, Hermann**, a German physician, born in Breslau, June 9, 1813. He studied in Berlin and graduated at Zürich in 1834. Subsequently he attended the clinics in Paris, practising his profession in Switzerland during the summer. Orfila employed him in collecting materials for the museum of comparative anatomy. After having perfected his knowledge of surgery under Dieffenbach in Berlin (1846-'7), he resumed his residence in Paris. He became professor at Zürich in 1853, and at Breslau in 1859, retiring in 1874. His principal work is *Traité d'anatomie pathologique générale et spéciale* (2 vols., Paris, 1855-'60, with 2 vols. of illustrations). Among his numerous other writings in French and German are *Recherches cliniques, expérimentales et microscopiques sur l'inflammation*, &c. (2 vols., Paris, 1845), and *Klinik der Brustkrankheiten* (2 vols., Tübingen, 1874).

**LEBLANC, Urbain**, a French veterinary surgeon, born near Bressuire, Nov. 26, 1796. He studied and taught at Alfort, and became in 1832 a surgeon to the prefecture of police in Paris, and in 1852 a member of the medical academy. He established an extensive farriery, and introduced various ingenious methods and instruments into the practice of his profession. He has published, with Trousseau, *Anatomie chirurgicale des principaux animaux domestiques* (Paris, 1839), and with Follin, *Traité de pathologie comparée* (2 vols., 1855), besides other works.

**LEBCEUF, Edmond**, a French general, born in Paris, Dec. 6, 1809. He served in Algeria and

in the Crimea, distinguished himself at the battle of the Alma, and was made brigadier general. In 1857 he became general of division, and in 1859 bore a prominent part in the battle of Solferino. In August, 1869, he succeeded Niel as minister of war, but resigned two months afterward. He resumed the post in January, 1870, in the Ollivier ministry, was made marshal of France in March, and reported very favorably as to the fitness of the French army to engage in a war with Germany. On the day of the declaration of war (July 19) he was appointed chief of staff of the army of the Rhine, though retaining his portfolio. After the first disasters of the campaign he was removed from the ministry, and subsequently served under Bazaine at Metz. For some time he was a prisoner of war in Germany, and subsequently took up his residence at the Hague.

**LE BRUN, Charles**, a French painter, born in Paris in 1619, died there, Feb. 12, 1690. He studied in the school of Simon Vouet, and at the age of 15 produced a picture of "Diomedes devoured by his own Horses." He afterward studied under Nicolas Poussin in Rome, and for about six years devoted himself to the study of the antique and of the old masters. Having returned to Paris, he was in 1648 admitted to the newly founded royal academy of painting and sculpture, of which he subsequently became president. At the recommendation of Colbert, Louis XIV. appointed him his first painter, and conferred upon him the direction of the manufactory of Gobelins tapestry. He painted a grand series of pictures, now at Versailles, illustrating the military triumphs and public works of the reign of Louis XIV., executed in a half classical, half allegorical style, the monarch being represented in a Roman toga with the flowing peruke of the 17th century, and with other incongruities and anachronisms. For the Louvre he painted a series entitled "The Battles of Alexander," which are considered among his finest works, and are well known through the engravings of Gérard Audran. Another of his pictures, "Mary Magdalen washing the Feet of the Saviour in the House of Simon the Pharisee," was so highly esteemed that in 1815 the emperor of Russia accepted it in exchange for the celebrated "Marriage at Cana," by Paul Veronese, now in the Louvre.

**LEBRUN, Charles François**, duke of Piacenza, a French statesman, born at St. Sauveur-Lendelin, Normandy, March 19, 1739, died near Dourdan, June 16, 1824. In early life he secured the protection of Chancellor Maupeou, and after the downfall of his patron occupied himself with prose translations of Tasso's *Gerusalemme liberata*, Homer's Iliad, and other works. A letter advocating political and social reforms, published by him in 1789 under the title of *La voix du citoyen*, brought him into considerable notice, and he was elected a deputy to the states general. As a member of the constituent assembly he opposed the issu-

ing of assignats and the establishment of lotteries. He subsequently became president of the administrative directory of Seine-et-Oise, was twice imprisoned during the reign of terror, entered the council of the ancients in 1795, and after the 18th Brumaire was chosen by Bonaparte third consul. He rendered important services in the adjustment of the finances and the establishment of the court of accounts, and after the coronation of the emperor was created arch-treasurer and duke. He was also at different times governor general of Liguria and of Holland. After the abdication of Napoleon he adhered to the Bourbons; but having accepted the office of grand master of the university under the emperor during the hundred days, he was excluded from the chamber of peers till 1819. His latter years were passed in retirement, during which he finished a translation of the Odyssey.

**LEBRUN, Marie Louise Elisabeth**, a French painter, born in Paris, April 16, 1755, died there, March 30, 1842. Her father, M. Vigée, was a painter, and her stepfather was a goldsmith, who exhibited in his shop her earliest portrait, which attracted much attention. She was patronized by Marie Antoinette, and was a favorite in fashionable society. She was admitted to the academy of painting, from which females were subsequently excluded. Her marriage in 1775 with Jean Baptiste Pierre Lebrun, the art critic and amateur, who died in 1813, was not a happy one, and they lived most of the time apart. In 1789 she went to Italy, where she was received with great distinction, and painted a remarkable portrait of Lady Hamilton in the character of a bacchante. She afterward visited Germany, Russia, England, and Switzerland. While in London (1802-'5) she painted portraits of the prince of Wales and of Lord Byron. She was in Switzerland in 1808-'9, and painted Mme. de Staël as Corinne, one of her best portraits. Notwithstanding many disappointments and reverses, she retained her artistic and social prominence to extreme age, and in her 80th year executed a portrait of her niece, which showed no decline in power. Besides portraits she painted landscapes and several semi-allegorical pieces. She wrote *Souvenirs de Mme. L. É. Vigée-Lebrun* (3 vols., Paris, 1835-'7), which contains lists of more than 650 portraits, 200 Swiss and English landscapes, and 15 other pictures.

**LEBRUN, Pierre Antoine**, a French poet, born in Paris, Nov. 29, 1785, died there in 1873. At an early age he wrote a tragedy entitled *Coriolan*, and other poetical compositions, which secured for him the patronage of François de Neufchâteau, one of the ministers of the directory. For his poem on the battle of Austerlitz he received a pension of 1,200 francs from the government. After the fall of the empire he celebrated the glories of Napoleon in a series of poems. In 1828 he succeeded Count Neufchâteau as a member of the French academy. From 1831 to 1848 he was director of

the royal printing establishment. For some time he was a member of the chamber of peers under Louis Philippe, and in 1853 became a member of the imperial senate. His complete works (5 vols., 1844-'63) include a number of dramas, of which his *Marie Stuart* is based upon Schiller's tragedy of that name.

**LEBRUN, Ponce Denis Écouchard**, a French poet, born in Paris, Aug. 11, 1729, died there, Aug. 31, 1807. He was brought up in the family of the prince de Conti, and as early as his 12th year he began to write verses. His early life was not fortunate, his wife, a beautiful woman, celebrated in many of his poems under the name of "Fanny," having procured a legal separation after a stormy union of 14 years, and his little property having been dissipated by the insolvency of the prince de Guéméné. He avenged himself on his enemies by stinging epigrams and passionate lyrics. Upon the appointment of Calonne as comptroller general of finance, he received a pension of 2,000 livres, and his muse was energetically employed in celebrating the virtues of the king; and after the downfall of the monarchy he sang the praises of the republic. He subsequently ingratiated himself with the first consul, and received a pension of 6,000 francs.

**LECCE. I.** A S. E. province of Italy, formerly called Terra d'Otranto, and forming part of the division of Apulia, though in antiquity it formed the separate division of Calabria or Messapia; area, 3,293 sq. m.; pop. in 1872, 493,594, including about 40,000 Arnauts and Greeks. It is traversed in its entire length from N. W. to S. E. by the Apennines. Among the more important coast rivers are the Lieto and the Galeso. The climate is mild, but the province often suffers from great drought. Among the chief products are corn, cotton, tobacco, wine, and olives. It is divided into the districts of Brindisi, Gallipoli, Lecce, and Taranto. **II.** A city, capital of the province, at the foot of the Apennines, 21 m. S. S. E. of Brindisi; pop. in 1872, 23,247. It is the seat of a bishop, of a prefect, and a tribunal of primary jurisdiction, and has a lyceum, a castle, and manufactories of tobacco and cotton. The Lecce oil, the best kind of table oil, constitutes an important article of trade. During the middle ages Lecce was a county of the Normans; and in 1189 Count Tancred of Lecce became king of Sicily.

**LECH** (anc. *Licus*), a river of Germany, a tributary of the Danube, rising from Lake Formanin in Vorarlberg, Austria, at a height of 6,000 ft., E. of the Rothe Wand mountain (9,000 ft. high). Entering Tyrol, it flows for about 50 m. in an E. N. E. course, along a narrow and sombre valley, to Reute, and thence in a winding course toward the north, between famous ridges and lakes of the Algau Alps, to Füssen, above which it enters Bavaria. Near the boundary it forms a cataract and the finest rapids in Germany. It then flows N., on the confines of Upper Bavaria and Swabia, passing

Schöngau, Landsberg, Augsburg, and Lechhausen, and terminating its course of about 180 m. near a ruined castle in the vicinity of Lechsend. Its principal affluents are the Vils and the Wertach. Owing to the torrent-like velocity of the Lech it is not suitable for navigation. The plain of Lechfeld, between the Lech and the Wertach, extending from Landsberg to Augsburg, was the scene of a memorable victory achieved by the emperor Otho I. over the Hungarians, Aug. 10, 955. In opposing the passage of the Lech, near Rain, by Gustavus Adolphus, Tilly was mortally wounded, April 5, 1632.

**LECHEVALIER, Jean Baptiste**, a French archaeologist, born near Coutances, in Normandy, July 1, 1752, died in Paris, July 2, 1836. He was secretary of legation under Count de Choiseul-Gouffier at Constantinople, and his associate (1785-'6) in exploring the Troad. In 1805 he became director of the library of Ste. Geneviève in Paris. While in England he lived for several years in the house of Sir Francis Burdett, and in Edinburgh he delivered a lecture on Troy before the royal society, which was published in English by A. Dalzel (London, 1791). His *Voyage de la Troade* (3d and enlarged ed., 3 vols. Paris, 1802), gave rise to much controversy; and his *Ulysse-Homer* (Paris, 1829), published under the *nom de plume* of Constant Koliadès, in which he endeavored to show that Ulysses was the author of the Homeric poems, was regarded as absurd. His other writings include *Voyage de la Propontide et du Pont Euxin* (2 vols., Paris, 1800).

**LECKY, William Edward Hartpole**, a British author, born near Dublin, March 26, 1838. He graduated at Trinity college in that city in 1859, taking the degree of M. A. four years later, and from this time devoted himself to political and philosophical literature. His first important work, "The Leaders of Public Opinion in Ireland," was published anonymously in 1861, and attracted immediate attention. It was republished under his own name in 1871-'2. In 1865 he published the earlier of the two works which have chiefly contributed to his reputation, "History of the Rise and Influence of the Spirit of Rationalism in Europe" (2 vols., London; 4th ed., 1870). This was followed by his "History of European Morals from Augustus to Charlemagne" (2 vols., London, 1869). The last named work especially has been widely read, and a German translation of it appeared in 1871.

**LE CLEAR, Thomas**, an American painter, born in Owego, N. Y., March 11, 1818. In 1839 he opened a studio in New York, where his picture "The Reprimand" was purchased by the art union. In 1844 he removed to Buffalo, where he remained painting portraits till 1860, when he established himself in New York. Among his most successful portraits are those of Daniel S. Dickinson, Millard Fillmore, T. B. Thorpe, the artists Gifford, McEntee, and Hubbard, and Edwin Booth as Hamlet.

He has also painted "The Marble-players," "Young America," and "The Itinerants."

**LE CLERC, Jean**, a Protestant theologian, of French descent, born in Geneva, March 19, 1657, died in Amsterdam, Jan. 8, 1736. His ancestors had taken refuge in Geneva, and he was educated under the care of his father, Etienne Le Clerc (1599-1676), and in 1679 was admitted to the ministry, after which he studied at Saumur. In 1682 he preached for some time in London, and subsequently went to Holland. His theological opinions leading to his exclusion from the Walloon church, he became in 1684 professor of literature, philosophy, and Hebrew at the college of the Remonstrants in Amsterdam, and afterward of ecclesiastical history. In 1728 a stroke of paralysis obliged him to retire. He had a protracted controversy with Bayle, chiefly on account of the strictures of the latter upon Cudworth's "Intellectual System of the Universe." He was a man of great erudition, and exerted a wide influence upon the theological opinions of his time. Among his works are: *Bibliothèque universelle et historique* (26 vols., Amsterdam, 1686-'93), in the first 10 volumes of which La Croze assisted him; *Bibliothèque choisie*, &c. (28 vols., 1703-'13); *Bibliothèque ancienne et moderne* (28 vols., 1714-'27), the last volumes of which are by Bernard, and a 29th volume was published in 1730; *Vie du cardinal Richelieu* (2 vols., 1694; often republished); *Commentarii Philologici et Paraphrasis in Vetus Testamentum* (4 vols., 1690-1731); *Ars Critica* (2 vols., 1696; enlarged ed., 3 vols., 1731); and *Parrhasiana*, a series of disquisitions vindicating his opinions (1699; enlarged ed., 2 vols., 1701; English translation, 1700). He also published an autobiography, *Johannis Clerici Vita et Opera* (Amsterdam, 1711; English translation, 1712).

**LECLERC, Sébastien**, a French engraver, born in Metz, Sept. 26, 1637, died in Paris, Oct. 25, 1714. He became proficient in the art of design under the tuition of his father, a goldsmith, and was for some time a geographical engineer, but finally devoted himself to engraving. Colbert placed him at the Gobelins with a pension of 1,800 francs. He was elected to the academy of painting, and was professor of perspective from 1672 to 1702, when he retired on a small pension. He formed his style upon that of Lebrun, improving it, however, by a careful study of Raphael. His published designs include nearly 4,000 subjects, all executed with remarkable correctness and elegance. Among his publications are valuable treatises on geometry, architecture, and perspective.—One of his ten children, LAURENT JOSSE LECLERO (1677-1736), was a professor of divinity, and a writer of some merit.

**LECLERC, Victor Emmanuel**, a French general, born at Pontoise, March 17, 1772, died near Santo Domingo, Nov. 2, 1802. He enlisted in the army in 1791, and distinguished himself during the siege of Toulon and in the Italian

campaigns, where he commanded the cavalry at Rivoli as brigadier general. He aided in the establishment of the consulate, for which he was made general of division and received several important commands. In 1801 Napoleon appointed him captain general of Santo Domingo, to enforce the decree for the restoration of slavery, and Leclerc reached Samana early in 1802, with his wife (Napoleon's sister Pauline), and with a large fleet and a force of more than 30,000 men. He combated the negroes with various success till May 1, when a truce was concluded, during which Toussaint l'Ouverture was sent as prisoner to France. The infuriated blacks renewed hostilities under Dessalines, while the French army was decimated by yellow fever, to which Leclerc succumbed. He was succeeded in command by Rochambeau. Pauline accompanied her husband's remains to France. Their only child died in 1804, a year after her second marriage with Prince Borghese.

**LECOMPTON**, a township of Douglas co., Kansas, on the S. bank of the Kansas river, 10 m. N. W. of Lawrence; pop. in 1870, 971. It is the seat of Lane university, under the control of the United Brethren, which was established in 1865, and in 1873 had 2 professors and 81 students. Lecompton was the territorial capital, and was prominent in the disturbances between the friends and opponents of slavery prior to the admission of the state. (See KANSAS.)

**LE CONTE. I. John**, an American naturalist, born near Shrewsbury, N. J., Feb. 22, 1784, died in Philadelphia, Nov. 21, 1860. He entered the corps of United States engineers in 1813, and was early employed in various important surveys and fortifications. He always manifested a taste for the natural sciences, to which he contributed many important papers in the departments of botany and zoölogy. His principal publications are: "Monographs of the North American Species of Utricularia, Gratiola, and Ruellia" (in the "Annals of the New York Lyceum of Natural History," vol. i.); "Observations of the North American Species of Viola" (ibid., vol. ii.); "Descriptions of the Species of North American Tortoises" (ibid., vol. iii.); "A Monography of North American Histeroides" (Boston "Journal of Natural History," vol. v.); and "Descriptions of Three New Species of Arvicola, with Remarks upon other North American Rodents" ("Proceedings of the Academy of Natural Sciences of Philadelphia," vol. vi.).

**II. John Lawrence**, an American naturalist, son of the preceding, born in New York, May 13, 1825. He graduated at the New York college of physicians and surgeons in 1846, and while a student made several scientific journeys to the western states. He has since travelled extensively in North and Central America, for the purpose of scientific investigation, and has contributed many memoirs to the transactions of scientific societies and to journals, mostly

upon the coleoptera of North America. Lists of these memoirs are given by Agassiz, *Bibliographia Zoologica*, and by Hagen, *Bibliotheca Entomologica*, &c. The principal ones are: "Catalogue of Geodaphagous Coleoptera of the United States" ("Annals of the New York Lyceum of Natural History," vol. iv.); "On the Pselaphidæ of the United States" (Boston "Journal of Natural History," vol. vi.); "On the Classification of the Carabidæ of the United States" ("Transactions of the American Philosophical Society," vol. x.); "Attempt to Classify the Longicornia of the United States" ("Journal of the Academy of Natural Sciences of Philadelphia," new series, vols. i. and ii.); and "Synopsis of the Melonthidæ of the United States" (*ibid.*, vol. iii.). The Smithsonian miscellaneous collections include his "Classification of the Coleoptera of North America" (1861-'2) and "List of the Coleoptera of North America" (1863-'6). In 1862 he entered the army as surgeon of volunteers, and was soon promoted to medical inspector in the regular army, in which capacity he served until that grade ceased to exist on the termination of the war. In 1873 he was elected president of the American association for the advancement of science.

**LE CONTE, I. John**, an American physicist, born in Liberty co., Ga., Dec. 4, 1818. He is a descendant of a French Huguenot who near the close of the 17th century emigrated to New Rochelle, N. Y. His grandfather removed to Georgia before the revolution. His father, Louis Le Conte, was a graduate of Columbia college, and became a diligent student of the natural sciences. John graduated at Franklin college, Athens, Ga., in 1838. In 1841 he received the degree of M. D. from the New York college of physicians and surgeons, and in 1842 settled in Savannah. He contributed largely to medical periodical literature, and from 1846 to 1855 was professor of natural philosophy in Franklin college, in 1855 lecturer on chemistry in the New York college of physicians and surgeons, and from 1856 to 1869 professor of natural and mechanical philosophy in South Carolina college, now the university of South Carolina. In 1869 he accepted the chair of physics and industrial mechanics in the university of California, which he still holds (1874). Among his more important papers are those on "Experiments on the Seat of Volition in the Alligator;" "Observations on the Exudation of Ice from the Stems of Vegetables, and the Protrusion of Icy Columns from Earth;" "Observations on the Freezing of Vegetables;" "Researches on the alleged Influence of Solar Light on Combustion;" "On the Influence of Musical Sound on a Gas Flame;" and "On the Discrepancy between the computed and the observed Velocity of Sound in Air and Gases." A treatise on "General Physics," nearly completed by him, was destroyed in the burning of Columbia, S. C., in 1865. **II. Joseph**, an American physicist, brother of the preceding, born in

Liberty co., Ga., Feb. 26, 1823. He graduated at Franklin college, Ga., in 1841, and at the New York college of physicians and surgeons in 1845. In 1848 he settled as a physician in Macon, Ga., and in 1850 went to Cambridge, Mass., to complete a course of studies in natural history and geology under Agassiz, whom he accompanied in 1851 on an exploring expedition to Florida. After graduating at the Lawrence scientific school in Cambridge, he held for one year the chair of natural sciences in Oglethorpe university. He was then for four years professor of natural history and geology in Franklin college, and from 1856 to 1869 of chemistry and geology in South Carolina college. Since 1869 he has been professor of geology and natural history in the university of California. Among the more important of his scientific papers are: "On the Agency of the Gulf Stream in the Formation of the Peninsula and Keys of Florida;" "On the Correlation of Vital Force with Physical and Chemical Forces;" a series of papers "On the Phenomena of Binocular Vision and the Theory of Binocular Relief;" "A Theory of the Formation of the Great Features of the Earth's Surface;" "On some of the Ancient Glaciers of the Sierras;" "On the great Lava Flood of the Northwest;" and "On the Structure and Age of the Cascade Mountains." Among his literary productions are several essays on education and on the nature and uses of fine art. He has also published "The Mutual Relations of Religion and Science."

**LECOQ, Henri**, a French naturalist, born at Avesnes, April 14, 1802, died in Clermont-Ferrand in 1871. He was for many years professor of natural history in the medical school of Clermont-Ferrand, keeper of the mineralogical cabinet, and director of the botanic garden. He wrote numerous works on botany, geology, and agriculture, edited the *Annales de l'Auvergne* (30 vols. 8vo, 1828 *et seq.*), and made considerable donations in money and collections to public institutions. His principal work is *Études de la géographie botanique de l'Europe* (9 vols. 8vo, 1854-'8).

**LECOUVREUR, Adrienne**, a French actress, born at Laméry about 1690, died in Paris, March 20, 1730. She was the daughter of a hatter who established himself in Paris in 1702, and her dramatic genius was evinced by her performances in private theatricals while she was employed as a laundress. In 1717 she made her appearance at the Comédie Française, and was soon recognized as the first French actress of her day, excelling both in tragedy and comedy. Among her lovers, by several of whom she had children, was Maurice of Saxony; and when he needed money to enable him to reconquer Courland, Adrienne raised for him 40,000 francs by selling her plate and jewelry. She died suddenly, and was said to have been poisoned by the duchess de Bouillon, another mistress of Maurice; but the truth of this statement has never been established.

Burial in consecrated ground was refused to her remains, and Voltaire, who was counted among her lovers, wrote a poem, *La mort de Mademoiselle Lecouvreur*, which involved him in trouble, so that he was obliged to leave Paris. Scribe and Legouvé made the career of Adrienne Lecouvreur the theme of a play, which achieved great celebrity from the representation by Rachel of the character of the heroine, which was said to be in many respects similar to her own.

**LE CREUZOT**, a town of France, in the department of Saône-et-Loire, 11 m. S. E. of Autun; pop. in 1866, 23,872. The town and its environs contain the most extensive iron founderies, coal mines, and machine factories in France, which about 1837 were acquired by Messrs. Schneider and co. from an English company. The population was quadrupled between 1846 and 1866, and more than 10,000 persons are employed in the works, which occupy over 500 acres, about 75 of which are covered by workshops. There are about 200 coke ovens and over 20 blast furnaces, besides founderies, locomotive factories, and copper works. The principal products are locomotives, steamboat engines of the largest size, and vast quantities of iron, coal, rails, sheet-iron and iron ware, and instruments of almost all descriptions. A railway of about 6 m. conveys the products to the central canal or canal of Charolais. Great attention is paid to the comfort, medical treatment, and education of the workmen and their families, about 3,000 children attending the industrial school. The works were known at the end of the 18th century, and a large foundry of cannon and cartridges existed here during the revolutionary wars. An extensive manufactory of crystals for chandeliers, rivalling the Bohemian and English establishments, also existed here for a long time, but has been removed to Baccarat. Le Creuzot has attained its present importance through the enterprise of Eugène Schneider, president of the corps législatif under the second empire, and of his elder brother. Strikes of the workmen took place in January and March, 1870, in consequence of a proposition made by the resident manager relative to the benefit fund of the establishment. The former was suppressed only after the arrival of 3,000 troops and the arrest of a few ringleaders. The latter kept Le Creuzot and other centres of industry in a state of excitement for nearly six months.

**LECTOURE**, a town of France, in the department of Gers, on the river Gers, 46 m. N. W. of Toulouse; pop. in 1866, 6,086. It has a college and a hospital. It is the birthplace of Marshal Lannes, to whom a monument has been erected here. In ancient Gaul it was the capital of the tribe of the Lectorates. It became at an early time the seat of a bishopric, which was abolished in 1801.

**LEDA**, in Greek mythology, the daughter of King Thestius or Glaucus. She was wife of

Tyndareus, by whom she was at first mother of Timandra and Philonoe. Her great beauty attracted the love of Jupiter, and she gave birth at the same time to Castor and Clytemnestra, who were of mortal nature, being begotten by Tyndareus, and to Pollux and Helen, who were children of Jupiter and immortal. According to the most common legend, Jupiter surprised her under the form of a swan, and she brought forth two eggs, from one of which issued Helen, and from the other Castor and Pollux. There are still other versions concerning her connection with Jupiter, and there are several of her subsequent history. One account states that she was after death deified as Nemesis, while another declares that Nemesis was the mother and Leda only the nurse or guardian of the eggs. Mythologists have conjectured an identity between Leda and Leto or Latona.

**LEDEBOUR, Karl Friedrich von**, a German traveller, born in Stralsund, July 8, 1785, died in Munich, July 4, 1851. He graduated at Stockholm as doctor of philosophy at an early age, and was appointed in 1805 teacher and director of the botanic garden at Greifswald. In 1811 he became professor of natural history at the university of Dorpat in Russia. In 1826 he explored the Altai mountains, and the result of his investigations is embodied in his *Reise durch das Altaigebirge und die Dsongarische Kirgisiensteppe* (2 vols., Berlin, 1829-'30), and in his *Flora Altaica* (4 vols., Berlin, 1829-'34). In the preparation of the latter work, as well as in that of *Icones Plantarum Novarum Floram Rossicam illustrantes* (5 vols. fol., with 500 colored plates, Riga, 1829-'34), he was assisted by his travelling companions Meyer and Bunge. He regarded his *Flora Rossica* (3 vols., Stuttgart, 1842-'51) as his greatest scientific achievement. He resided successively in Odessa and Heidelberg, and in Munich from 1843 to the time of his death.

**LEDRU-ROLLIN, Alexandre Auguste**, a French politician, born in Paris, Feb. 2, 1808. The son of a wealthy physician, he studied law, and was admitted to the bar in 1830. Soon after, in order to distinguish himself from another member of the bar of the same name, he added to his proper name Ledru that of his natural great-grandfather Rollin. A paper on martial law, which had been proclaimed at Paris by the government in consequence of the republican insurrection of 1832, gave evidence of his ability as a lawyer. Two years later his *Mémoire sur les événements de la rue Transnonain* produced a deep sensation, and thenceforth he was employed as counsel by most of the opposition journals and republican conspirators who were prosecuted under Louis Philippe. In 1837 he assumed the editorship of the *Journal du Palais*, a law periodical, reprinted the volumes previously published (27 vols. 8vo, 1791-1837), and continued it for ten years. He also superintended the publication of *Jurisprudence française, ou Répertoire du Journal du Palais* (8 vols. 4to, 1843-'8), and

added to it a remarkable introduction. In 1844-'6 appeared his *Jurisprudence administrative en matière contentieuse de 1789 à 1831* (9 vols. 8vo). About the same time he was the chief editor of the daily law newspaper, *Le Droit*. In 1838 he bought the place of attorney at the court of cassation, but disposed of it in 1846 in order to devote more time to politics. In 1841 he had been elected deputy by the department of Sarthe, by a nearly unanimous vote, to succeed Étienne Garnier-Pagès, who had just died. He made a bold confession of his republican creed, which caused him to be prosecuted by the government; he was sentenced to four months' imprisonment and a fine of 3,000 francs, but on a new trial was acquitted. He spoke often in the chamber of deputies, but exerted little influence; and not receiving hearty support from the opposition press, he established, under the editorship of Flocon, a journal of his own, *La Réforme*, which advocated not only political but social reforms. In 1845 he issued a socialist manifesto, which secured him a considerable party in the lower ranks of society, while it estranged from him the middle classes. His uncompromising support of the doctrine of universal suffrage displeased also the monarchical opposition party. He took a leading part in all the republican demonstrations in the provinces during the year 1847; and when the revolution of February, 1848, broke out, it was he who chiefly prevented the regency of the duchess of Orleans from being accepted by the chamber of deputies, and secured the powerful help of Lamartine. On the organization of the provisional government, he was elected one of its members. His position was embarrassing; he was associated with men whose principles were entirely discordant, some, like Lamartine and Eugène Garnier-Pagès, entertaining moderate opinions, others, like Louis Blanc and Albert, anxious to bring about a radical change in the social system. Unwilling to go as far as these socialistic revolutionists, he gradually lost his popularity among the lower classes, while he became more than ever distrusted by the *bourgeoisie*. Their distrust was deepened into hatred when, as minister of the interior, he issued revolutionary circulars and sent special commissioners to various parts of France to further the democratic organization of the departments. Nevertheless he evinced great courage in maintaining tranquillity in Paris; his timely precautions defeated the insurrectionary attempt of April 16; he protected the *Presse* and Émile de Girardin against a mob, and reconciled the democrats of Paris to the return of the army to the capital. But his efforts to prevent an open rupture between the opposing parties nearly lost him his seat at the ensuing elections. On the formation of the executive commission by the assembly, he was the last on the list, and received but 458 votes out of about 800. The insurrection of May 15 increased the dis-

trust of all parties toward him. He aided in defeating the object of the insurgents; but when Louis Blanc and Causidière were accused before the assembly, he courageously defended them. When, in consequence of the insurrection of June 24, the executive power devolved on Gen. Cavaignac, Ledru-Rollin resumed his seat in the assembly. His speeches against the state of siege, his explanations of the insurrection of June, and his protest against the sending of a French army to Italy were particularly admired as efforts of oratory. In the presidential election of December, 1848, he presented himself as the democratic candidate, but received only 370,119 votes, while Louis Napoleon Bonaparte obtained more than 5,000,000, and Cavaignac nearly 1,500,000. The standing he held in the assembly, his denunciations of the reactionary tendencies of the majority and the government, and his eloquent appeals in behalf of a truly republican system, somewhat revived his popularity during the first part of 1849. To strengthen this returning favor he assisted at banquets in Le Mans, Châteauroux, and Moulins, where his democratic addresses were hailed with unbounded enthusiasm. A brutal attack upon his person also had the effect of gaining him much sympathy; and in the elections for the legislative assembly he was chosen by five departments at once, Seine, Allier, Var, Saône-et-Loire, and Hérault, while seven others gave him a very heavy vote. This encouraged him to oppose the government still more strongly, and especially to present himself as the defender of the Roman republic, which was on the point of being crushed by the arms of France. On June 11 he moved the impeachment of the president and his cabinet. On the 13th he attempted an insurrectionary demonstration; at the head of a few deputies, some artillerymen of the national guard under Guinard, and a few hundred citizens, he went to the *conservatoire des arts et métiers*; but here, before they had time to take any decisive measures, the insurgents were surrounded by troops. Some of them escaped through an upper window. Ledru-Rollin, after remaining concealed for about three weeks in the neighborhood of Paris, escaped to Belgium, and then went to England, whence he directed a solemn protest against the decree summoning him before the high court of justice. He was sentenced by default to transportation for life. From 1849 to 1870 he resided in London, where he supported himself partly by the remnants of his property and partly by his pen. Besides a pamphlet, *Le 13 juin*, 1849, an apology for his conduct on that day, he published *De la décadence de l'Angleterre* (2 vols. 8vo, Paris, 1850), and *La loi anglaise* (2 vols. 8vo). He was also one of the principal contributors to *La voix d'un proscrit*. He associated himself for a while with Kossuth, Mazzini, Ruge, and other leading revolutionists, in the hope of concentrating the efforts of the European democracy. In 1857 he was accused,

in connection with Mazzini, of a plot against the life of Napoleon III., and was a second time sentenced to transportation. He was also specially excepted from the proclamation of amnesty issued by the emperor in 1860, and again from that issued in 1869. In the latter year the wing of the radical party of which Rochefort was the leader endeavored to enlist him in their cause, but he refused to lend his name to their support. In consequence of this the Ollivier ministry, in January, 1870, revoked the exception made against him in the decrees of amnesty, and he returned to France in March. During the siege of Paris he spoke a few times at radical banquets, and during the insurrection of Oct. 31 he was chosen a member of the committee of public safety, but did not appear at the *hôtel de ville*. At the election of Feb. 8, 1871, he was chosen a member of the national assembly, but resigned on the 19th, on the ground that the election held in such disastrous circumstances did not indicate the free choice of the electors. He remained for some time in retirement, but in March, 1874, was returned to the national assembly from the department of Vaucluse. He is now very rich, having recovered property long withheld from him.

**LEDYARD, John**, an American traveller, born in Groton, Conn., in 1751, died in Cairo, Egypt, Jan. 17, 1789. He lost his father in early childhood, and after an ineffectual attempt to pursue the study of the law, at his mother's request he entered Dartmouth college in 1772, with a view of fitting himself for missionary duty among the Indians. The restraints of this mode of life proving irksome, he absented himself at one time from college for several months, during which he visited the Indians of the Six Nations; and finally, abandoning the idea of becoming a missionary, he embarked on the Connecticut river in a canoe and floated down to Hartford. After a brief experience as a theological student, he shipped at New London as a common sailor in a vessel bound for the Mediterranean, and at Gibraltar enlisted in a British regiment, but was discharged at the request of his captain. Returning to New London at the end of a year, he embarked soon after at New York for England, and arrived in London just as Capt. Cook was about to sail on his third and last voyage around the world. Having procured an introduction to Cook, he was engaged for the expedition and made corporal of marines. Of this voyage he kept a private journal, which in accordance with a general order of the government was taken from him on the return of the expedition to England. Subsequently he wrote out from recollection, assisted by a brief sketch issued under the sanction of the admiralty, an account of the expedition, which was published in Hartford in 1783. During the two years succeeding his return to England he remained in the British naval service, but steadily refused to take arms against his native country.

In December, 1782, being in a British man-of-war off Long Island, he found means to escape, and revisited his friends after an absence of eight years. Having spent many months in fruitless endeavors to fit out an expedition to the N. W. coast, which he was the first of his countrymen to propose, he embarked for Europe in June, 1784, in the hope of finding there the means of carrying his project into effect. He spent a long time in negotiations at Lorient and Paris, at each of which strong hopes were held out to him; but being finally disappointed, he determined to carry out his original design by a journey through northern Europe and Asia, and across Behring strait to the western hemisphere. After further delays and disappointments, he was supplied with a small sum of money by Sir Joseph Banks and others, and departed on his long overland journey in the latter part of 1786. Arriving at Stockholm, he attempted to cross the gulf of Bothnia on the ice to Abo in Finland, but was met by open water in the middle. He immediately altered his course, and in the dead of winter walked around the whole coast of the gulf, arriving in St. Petersburg in the latter part of March without money, shoes, or stockings. This journey of upward of 1,400 m. was accomplished in less than seven weeks. After a delay of several weeks he procured his passport from the empress, and received permission to accompany Dr. Brown, a Scotchman in the Russian service, as far as Barnaul in southern Siberia, a distance of about 3,000 m. Here he parted with his companion, and proceeded to Irkutsk, whence he sailed in a small boat 1,400 m. down the river Lena to Yakutsk. Permission to proceed to Okhotsk being refused, on the ground that the season was too far advanced, it being then the latter part of September, he accompanied a Capt. Billings, in the Russian service, back to Irkutsk, where on Feb. 24, 1788, he was arrested by order of the empress. Accompanied by two guards, he was conducted with all speed to the frontiers of Poland, and there dismissed, with an intimation that he would be hanged if he reëntered Russia. The reason for this summary expulsion of Ledyard from the Russian dominions has never been satisfactorily explained. He found his way back to London in the spring, to use his own words, "disappointed, ragged, and penniless, but with a whole heart," and was cordially received by Sir Joseph Banks and others who had befriended him. Undaunted by previous adversities, he eagerly accepted an offer made to him by the association for promoting the discovery of the inland parts of Africa, to undertake an expedition into the interior of that continent; and when asked how soon he would be ready to set out, replied, "To-morrow morning." He departed from England in the latter part of June, intending to cross the African continent in a westerly direction from Sennaar, and had proceeded as far as Cairo when he was attacked by a bilious disorder

which put an end to his life. His death was considered a great loss to the society under whose auspices he had embarked, and who from the tenor of his first despatches from Egypt, and from his previous labors, had been impressed with his fitness for the part of a geographical pioneer. For capacity of endurance, resolution, and physical vigor, he was one of the most remarkable of modern travellers; and had he possessed means equal to his zeal, his name would doubtless have been associated with important discoveries, as it now is with wonderful and romantic but unprofitable adventures. Many extracts from his journals and his private correspondence with Jefferson and others are given in his "Life" by Jared Sparks ("Library of American Biography," 2d series, vol. xiv.).

**LEDYARD, William**, an American revolutionary soldier, uncle of the preceding, born in Groton, Conn., about 1750, killed at the capture of Fort Griswold, Sept. 7, 1781. He held the commission of colonel in the militia of Connecticut, and during the marauding expedition of Arnold along the coast of that state in September, 1781, he was in command of Forts Trumbull and Griswold, which protected New London. Throwing himself into the latter work with 157 militia hastily collected, he refused a demand for its surrender, and resisted for nearly an hour the attack of a British force numbering 800 men, led by Lieut. Col. Eyre, who received a mortal wound in the onset. His successor, Major Montgomery, having been killed while mounting the parapet, the command devolved upon Major Bromfield, a tory, who effected an entrance into the fort after nearly 200 of his men had been disabled, including 48 killed, the Americans having lost about a dozen killed. To Bromfield's inquiry, "Who commands this garrison?" Ledyard replied, "I did, sir, but you do now," at the same time handing him his sword. Bromfield immediately plunged it through the body of Ledyard to the hilt, killing him upon the spot. A massacre of the Americans ensued, which was not stopped until more than 100 of them were killed and wounded. A monument has been erected near the spot to commemorate this event.

**LEE**, the name of eight counties in the United States. **I.** The S. W. county of Virginia, bordering on Tennessee and Kentucky, and traversed by Powell's river; area, 512 sq. m.; pop. in 1870, 13,268, of whom 1,005 were colored. Powell's mountain lies on its E. boundary, and Cumberland mountain on the N. W. Iron ore, limestone, and saltpetre are found. The soil in the valleys is very fertile. The chief productions in 1870 were 81,620 bushels of wheat, 367,790 of Indian corn, 66,881 of oats, 12,108 of Irish potatoes, 21,864 lbs. of wool, and 132,547 of butter. There were 2,314 horses, 2,581 milch cows, 4,980 other cattle, 11,523 sheep, and 14,564 swine; 4 flour mills, and 6 wool-carding and cloth-dressing establishments.

Capital, Jonesville. **II.** A S. W. county of Georgia, bounded E. by Flint river; area, 600 sq. m.; pop. in 1870, 9,567, of whom 7,643 were colored. It has a nearly level surface, wooded with pine, oak, and hickory, and a fertile soil. The Southwestern Georgia railroad passes through it. The chief productions in 1870 were 155,565 bushels of Indian corn, 13,230 of sweet potatoes, and 10,179 bales of cotton. There were 187 horses, 1,141 mules and asses, 852 milch cows, 2,081 other cattle, 659 sheep, and 2,727 swine. Capital, Starkville. **III.** A S. E. county of Alabama, separated from Georgia by the Chattahoochee river; area, about 550 sq. m.; pop. in 1870, 21,750, of whom 11,597 were colored. The surface is uneven, and the soil fertile. The Western railroad traverses it. The chief productions in 1870 were 35,868 bushels of wheat, 244,955 of Indian corn, 44,005 of oats, 58,827 of sweet potatoes, 112,391 lbs. of butter, and 11,591 bales of cotton. There were 1,265 horses, 1,927 mules and asses, 3,444 milch cows, 6,312 other cattle, 2,019 sheep, and 10,285 swine; 10 flour mills, and 2 saw mills. Capital, Opelika. **IV.** A N. E. county of Mississippi, drained by the Tombigbee river; area, about 600 sq. m.; pop. in 1870, 15,955, of whom 4,855 were colored. The surface is level or undulating, and the soil fertile. The Mobile and Ohio railroad passes through it. The chief productions in 1870 were 443,901 bushels of Indian corn, 76,470 of sweet potatoes, 187,963 lbs. of butter, and 8,224 bales of cotton. There were 3,099 horses, 1,688 mules and asses, 4,025 milch cows, 7,574 other cattle, 6,689 sheep, and 23,442 swine. Capital, Tupelo. **V.** An E. county of Arkansas, formed in 1878 from portions of Crittenden, Monroe, Phillips, and St. Francis counties. It is bounded E. by the Mississippi, and is intersected by the St. Francis and L'Anguille rivers. The surface is generally level, and the soil of extraordinary fertility. Corn and cotton are the principal products. Timber is abundant. Capital, Mariana. **VI.** An E. county of Kentucky, intersected by the Kentucky river; area, about 300 sq. m.; pop. in 1870, 3,055, of whom 131 were colored. The surface is hilly and mountainous, and the soil fertile. It is well wooded, and contains iron and coal. The chief productions in 1870 were 2,239 bushels of wheat, 68,463 of Indian corn, and 7,367 of oats. There were 349 horses, 514 milch cows, 777 other cattle, 1,973 sheep, and 2,646 swine. Capital, Beatyville. **VII.** A N. county of Illinois, drained by Rock and Green rivers and Bureau creek; area, 720 sq. m.; pop. in 1870, 27,171. The surface is chiefly an undulating prairie diversified by tracts of woodland. The soil is very fertile. The Illinois Central and the Chicago and Northwestern railroads cross it. The chief productions in 1870 were 453,053 bushels of wheat, 1,656,978 of Indian corn, 903,197 of oats, 154,665 of barley, 210,873 of potatoes, 26,042 of flax seed, 225,090 lbs. of flax, 44,107 of

wool, 753,149 of butter, 56,840 of cheese, and 57,506 tons of hay. There were 12,159 horses, 12,825 milch cows, 19,295 other cattle, 12,239 sheep, and 25,366 swine; 3 manufactories of agricultural implements, 8 of carriages, 2 of cooperage, 2 of dressed flax, 1 of iron castings, 5 of saddlery and harness, 1 of scales and balances, 1 of woollen goods, and 3 flour mills. Capital, Dixon. **VIII.** The S. E. county of Iowa, bounded N. E. by Skunk river, S. E. by the Mississippi, which separates it from Illinois, and S. W. by the Des Moines, which divides it from Missouri; area, 476 sq. m.; pop. in 1870, 37,210. Coal and limestone are abundant. The surface is diversified by woods and prairies, and the soil is extremely fertile. The Des Moines Valley railroad and the Burlington and Keokuk division of the Chicago and Burlington and Quincy pass through it. The chief productions in 1870 were 260,812 bushels of wheat, 96,553 of rye, 1,187,322 of Indian corn, 272,134 of oats, 132,176 of potatoes, 93,039 lbs. of wool, 451,724 of butter, 110,092 of cheese, and 24,060 tons of hay. There were 8,993 horses, 970 mules and asses, 7,959 milch cows, 12,360 other cattle, 21,446 sheep, and 24,938 swine. There are numerous manufacturing establishments, chiefly in Keokuk and the county seat, Fort Madison.

**LEE**, a town of Berkshire co., Massachusetts, on the Housatonic river and railroad, 110 m. W. of Boston, and 115 m. N. by E. of New York; pop. in 1870, 3,866. The town is handsomely situated, and there are many points of interest in the vicinity. It owes its prosperity chiefly to its extensive paper mills, and it is celebrated for its white marble, which was extensively used in the construction of the capitol at Washington. There are a national bank, 16 public schools, including a high school, a weekly newspaper, and eight churches. The town was settled in 1760.

**LEE**, the name of a family of Virginia, descended from an old cavalier family in England. Richard Lee emigrated to Virginia in the reign of Charles I., bringing with him a numerous household, and settled in the county of Northumberland, between the Rappahannock and Potomac rivers, a region known then and now by the name of the "Northern Neck." This gentleman was a devoted adherent of the Stuarts, and, in conjunction with the royal governor Sir William Berkeley, placed the colony in that attitude of resistance to Cromwell which caused the protector to send a fleet for its reduction under the commonwealth. The party of Lee and Berkeley displayed such determination, however, that the commander of the squadron was compelled to ratify a treaty with the rebellious colony, which was styled an "independent dominion." It is said that Richard Lee soon afterward hired a ship, and visited Charles II. in Flanders, offering to erect his standard in Virginia if assured of adequate support. The plan was not then carried out, but it has been stated that on the death of

Cromwell, Charles II., by the exertions of Lee and Berkeley, was proclaimed in Virginia "king of England, France, Scotland, Ireland, and Virginia," nearly two years before his triumphal entry into London. The king exhibited his gratitude for this espousal of his cause, it is also said, by ordering the arms of Virginia to be quartered on those of Great Britain, with the motto: *En dat Virginia quartam*. Richard, the son of Richard Lee, was a member of the council; and Thomas, third son of the second Richard, succeeded his father, and became president. He died at the moment when his commission of governor of the colony had just been made out. He married Hannah, daughter of Col. Philip Ludwell, an associate in the council; and from this union sprang five sons who rose to distinction, of whom the following are the principal. **I. Richard Henry**, an American statesman, born at Stratford, Westmoreland co., Va., Jan. 20, 1732, died at Chantilly in the same county, June 19, 1794. After a course of private tuition at Stratford, he was sent to Wakefield academy, Yorkshire, England, where he became a proficient in Latin and Greek, and laid the foundation of the extensive knowledge of the classics which afterward added so much to the effect of his oratory. Leaving school at about the age of 18, he made a tour through England, visited London, and returned in his 20th year to Virginia. His father had died two years before, and the young man found himself in possession of a competent estate. He applied himself with ardor to study in the diverse departments of law, politics, theology, science, history, and belles-lettres. At the age of 23, when Braddock came to Virginia, Lee raised a company of volunteers in Westmoreland, was chosen captain, and marched to Alexandria. The general, however, declined his services with an ill-concealed expression of contempt for "provincials," and Lee was compelled to march home again. In his 25th year he was appointed a justice of the peace, a class of officers then constituting the county courts; and notwithstanding his youth, a number of his brother magistrates petitioned the governor and council that Mr. Lee's commission might be antedated in such a manner as to give him legal precedence, and enable him to act as president of the court. He was soon after chosen a member of the house of burgesses from Westmoreland, but did not speak for one or two sessions, when he made a brief and striking but diffident speech strongly opposing the institution of slavery, and advocating the imposition of a tax so heavy as to amount to a prohibition of further importations. In 1764 he took an unhappy step, the effects of which clung to him in a measure throughout life, and dimmed the light of his greatest public services. In a thoughtless moment, and at the instigation of a friend, he wrote to England making application for the post of collector

under the proposed stamp act. That this step was the mere result of hasty and momentary impulse is abundantly proved by the whole tenor of his subsequent career. The small tory party, exasperated by the energy with which he opposed the government, denounced him as a popular demagogue, bent only on revenging his disappointment in procuring the collectorship. The people of his county treated this accusation with contempt; but to satisfy the inhabitants of the colony at large, who did not know him, he published in the "Virginia Gazette" a statement of the facts. He had written to England by the advice of a friend, who no more than himself, "nor perhaps a single person in this country, had at that time reflected the least on the nature and tendency of such an act." Reflection had opened his eyes, and he had soon determined to exert every faculty in opposition to the measure. He joined heart and hand with the opponents of the proposed tax; and when a special committee was appointed by the burgesses to draught an address to the king, a memorial to the lords, and a remonstrance to the commons against taxation without representation, Lee was placed upon the committee, and deputed by his associates to prepare two of the three papers. His literary and political acquirements well fitted him for the task, and the papers proved genuine and eloquent utterances of the spirit of resistance. He was absent from Williamsburg when Patrick Henry introduced, in the ensuing year (1765), his celebrated resolutions against the stamp act; but he warmly concurred in them, and originated an association in Westmoreland in accordance with their spirit. The articles of this association, which were written by Lee, and are still preserved in his own handwriting, go beyond Henry's resolutions, and indicate in a very striking manner the advance of public opinion from May, 1765, to February, 1766. They pledged its members, "at every hazard, and paying no regard to danger or to death, to exert every faculty to prevent the execution of the stamp act." That the association was in earnest is shown by the prompt arrest of a person who had accepted the place of collector. Lee and his friends proceeded to his house, burned his commission and supply of stamps, and compelled him to take an oath not to offend in future. At the winter session of the burgesses in 1766, Lee openly took his stand with the extreme party for reform, at the head of which stood Patrick Henry, by making a motion that the offices of speaker of the burgesses and treasurer of the colony should thenceforth be separate. It is difficult at this distance of time to imagine the profound sensation and the bitter resistance which this proposition aroused. The explanation may however be given in a few words. The death of Speaker Robinson, who also held the post of treasurer, had exposed an enormous deficit in the public accounts. This arose from the fact that Mr. Robinson, a gentleman of great wealth and

the most amiable disposition, had lent to prominent members of the house, who were his friends, large amounts in government bills returned to the treasury, and directed by law to be burned. This had long been suspected, and as early as 1763 Lee had moved that a committee should be appointed to inquire into the state of the treasury. The speaker had "fixed his eyes with a dark and terrible frown" upon the youthful reformer, and the recipients of the loans had "turned their faces from him with haughty and disdainful airs;" but he had persevered. Nothing came of the motion, however, and the subject slept till 1766, when, as has been seen, Lee renewed his motion. It was powerfully opposed by the "aristocratic" party, many of whom had the strongest reasons for desiring its defeat; and by others, like Edmund Pendleton, who had been strongly attached to the deceased speaker. Henry, however, came to Lee's assistance, and their united eloquence carried the motion. Mr. Robinson's ample estate, upon which he had relied to make good the deficit, satisfied the public claim, and the colony lost nothing; but a powerful engine of corruption was broken to pieces by the success of the measure. In 1767 Lee spoke with great ability against the acts levying duties upon tea and other commodities, and for quartering British troops upon the colonies. In 1768 he wrote from Chantilly, where he was then residing, to John Dickinson of Pennsylvania, suggesting a plan of private correspondence between the friends of liberty; and this scheme was enlarged and perfected by the appointment in 1773 of a committee of correspondence, to communicate with all the colonies. Lee was one of the five or six burgesses who in private meeting devised this plan, and is said to have originated the idea. The house promptly appointed the committee, and Lee was placed upon it. The great value of such a body was immediately shown. Acting under instructions from the house, the committee wrote to the sister colonies proposing a general congress. The proposition was almost universally acceded to; and the "first congress" met at Philadelphia, Sept. 5, 1774. Lee was one of the delegates from Virginia, and his voice was the second which was heard upon the floor. Patrick Henry preceded him in a much admired speech, of which the tradition only remains; and little more has been retained of Lee's. It is said, however, that the congress was even more impressed by his comprehensive views and political knowledge than by the "fire and splendor" of his eloquence, of which great accounts had reached them. He immediately took the prominent position to which his great talents and zeal entitled him, and was placed upon all the more important committees: those to prepare addresses to the king, the people of England, and the colonies; to state the rights and grievances of the colonies; and to carry out the resolutions of non-intercourse with Great Britain. Lee was chairman

of the first named committee, and reported its papers. Mr. Jay wrote the address to the people of England; that to the king was probably Lee's; but that Lee wrote the memorial to the people of British America is undisputed. This is one of the most masterly state papers of the period. It has been justly said to have "the double merit of including all the qualities which a public writing ought to possess, and of excluding all that it ought not." It was in speaking of this memorial and the addresses to the king and people of England, that Chatham pronounced his celebrated eulogy upon "the general congress at Philadelphia." Lee's memorial declares in the second paragraph, with solemn earnestness, that "in every case of opposition by the people to their rulers or of one state to another, duty to Almighty God, the Creator of all, requires that a true and impartial judgment be formed of the measures leading to such opposition; . . . that, neither affection on the one hand, nor resentment on the other, being permitted to give a wrong bias to reason, it may be enabled to take a dispassionate view of all circumstances, and to settle the public conduct on the solid foundations of wisdom and justice." The equally solemn conclusion is: "We think ourselves bound in duty to observe to you that the schemes agitated against these colonies have been so conducted, as to render it prudent that you should extend your views to mournful events, and be in all respects prepared for every contingency." In the spring of 1775 Lee was unanimously elected by his neighbors of Westmoreland a delegate to the convention to meet at Richmond in March. He there powerfully supported Patrick Henry's motion for the prompt embodiment of the militia, and was placed upon the committee to prepare a plan of defence. The convention, which had already passed a vote of thanks to himself and his associated delegates, then appointed him to the second congress. He accordingly proceeded to Philadelphia in May, and was placed upon the committees to prepare munitions of war, to encourage the manufacture of saltpetre and arms, and to devise means for the prompt transmission of intelligence between the colonies. As chairman of the committee appointed for the purpose, he drew up the commission and instructions of Gen. Washington as commander-in-chief of the armies of America. Lee's greatest public act at this time, however, was the preparation of the address to the inhabitants of Great Britain, the solemn and lofty tone of which places it in the first rank of American state papers. After a recital of the wrongs inflicted upon the colonies, it proceeds: "And shall the descendants of Britons tamely submit to this? No, sirs! we never will, while we revere the memory of our gallant and virtuous ancestors. . . . Admit that your fleets could destroy our towns, and ravage our sea-coasts; these are inconsiderable objects, things of no moment, to men whose bosoms glow

with the ardor of liberty. . . . Your ministers (equal foes to British and American freedom) have added to their former oppressions an attempt to reduce us by the sword to a base and abject submission. On the sword, therefore, we are compelled to rely for protection. Of this at least we are assured, that our struggle will be glorious, our success certain; since even in death we shall find that freedom which in life you forbid us to enjoy." In May, 1776, the Virginia house of burgesses directed her delegates to propose to declare the colonies independent; and at the request of his associates Lee accordingly moved "that these united colonies are and of right ought to be free and independent states; that they are absolved from all allegiance to the British crown; and that all political connection between them and the state of Great Britain is and ought to be totally dissolved." Lee's speech upon introducing the resolutions is said to have been one of the greatest that he ever delivered. They were seconded by John Adams, and a fiery debate immediately sprang up as to the propriety of the resolutions at that time, which lasted from the 7th to the 10th of June. On that day it was resolved that the subject should be postponed until the first Monday in July, and meanwhile, as the resolutions might be agreed to, that a committee should be appointed to draft a declaration of independence. Of this committee Lee, by established parliamentary usage, would have been the chairman; but on the evening of the 10th he received sudden intelligence of the dangerous illness of his wife, and returned immediately to Virginia. On the next day, the 11th, the committee was appointed, with Jefferson as chairman. In August Lee returned to his seat, and continued in the performance of his arduous public duties until June, 1777. During this time, indeed, he labored so uninterruptedly as seriously to injure his health. From the moment of his entrance into congress to the middle of the year 1777 he had served upon about 100 important committees, generally acting as chairman, and performing the greater portion of the labor of all. On June 5 it was ordered by congress, "that Richard Henry Lee have leave of absence, his health and private affairs requiring his return to Virginia." The private affair was a vindication of his character and public action from charges brought against him in the Virginia assembly, the effect of which had been to induce that body to leave him out in their recent appointment of delegates to the next congress. The indignation of Lee's friends was great. His brother, Francis Lightfoot Lee, and Mann Page, jr., then in congress, taking fire at the condemnation of their associate "in his absence, without opportunity of defence," wrote to the speaker of the house, tendering a resignation of their seats. The people of Westmoreland, ever true to Lee, had already elected him a member of the assembly, and he promptly made his appearance before

that body and demanded an inquiry into his conduct. It was granted; the senate united with the house, witnesses were examined, and Lee was heard in his defence. The charges were, that he had demanded of his tenants payment of their rent in produce instead of money, with a design to depreciate the paper currency of the country; that he had favored New England to the injury of Virginia; and that, as a member of the secret committee in congress, he had opposed the publication of their proceedings from a desire to conceal the embezzlement of the public money. These charges were fully refuted. As to the main imputation, that he designed injury to the currency by receiving produce in place of money for rent, it was shown that the proposition was made to his tenants in 1775, when the non-intercourse associations had ruined the sale of produce, when scarcely any paper money had been issued, and when it was a great favor and convenience to the tenants, for whose relief the plan was devised. Lee's speech upon this occasion is represented to have been full of noble eloquence, and to have affected his listeners profoundly. Without any display of passion or unbecoming anger, he plainly stated that certain evil-disposed persons hated him for that very zeal which good patriots had commended in him; and that these enemies, in his absence, had deliberately planned his destruction. He is said to have shed tears during his speech. The result was a resolution of thanks to Richard Henry Lee "for the faithful services he has rendered his country, in the discharge of his duty as one of the delegates of this state in general congress." When George Mason, one of the recently appointed delegates, soon afterward resigned, Lee was chosen in his place; and thus his vindication was formally recognized as complete. Such is a brief relation of an event which enlisted the deepest feelings of the country at the time, and which still remains a vivid tradition in the popular mind. The motive of the charges it is difficult at the present day to arrive at. Lee's prominent part in the exposure of Speaker Robinson's deficit, and the consequent hatred of the influential members who were involved in it, are said to have laid the foundation of a silent but bitter and profound hostility toward him; and the old application for a collectorship under the stamp act, never allowed to sleep, may have had its influence. Lee returned to congress, and in 1778 served upon 37 committees, though laboring under serious ill health. He continued to sit till 1780. During this and the three succeeding years he remained in Virginia, and as county lieutenant of Westmoreland actively exerted himself in repelling the enemy, who were making incursions on the banks of the Potomac. He also sat in the assembly, and took a prominent part in the debates. In 1784 he resumed his seat in congress, and was elected its president. In 1786 and 1787 he sat in the assembly; was again

elected to congress, and took his seat in the latter year; and when the federal constitution was adopted, was chosen one of the first two senators for Virginia. He was not a member of the Virginia convention to decide upon the adoption of the constitution, and was strongly opposed to that instrument, regarding it as a consolidation of political powers which would tend to destroy the independence of the state governments. Nothing, he said, could have induced him to accept the appointment of senator, except his reverence for the liberties of the land, and "a thorough conviction of the danger these will be exposed to by the unamended state of the new constitution." He exerted himself to carry the proposed amendments, and like his great associates lived to form a more favorable opinion of the instrument. He became a strong supporter of the administration of Washington, and fully approved of his course in the Genet affair, and of his neutrality policy. The last letter which he wrote upon political affairs was a long and earnest one to Washington, warmly approving his measures. In 1792 he finally retired from public service, received a vote of thanks from the Virginia assembly, and returned to Westmoreland.—Lee had married early in life Miss Aylett, by whom he had two sons and two daughters; and after her death, Mrs. Pinkard, who is said to have been "every way worthy of him." He was a devoted member of the Episcopal church, and was twice thanked by conventions of that denomination for the interest which he had taken in its affairs. His charity to the poor was extremely liberal, and no doubt largely contributed to his popularity in Westmoreland. This popularity never failed him, and he never suffered a political defeat in the county. His personal appearance was a valuable assistance to his oratory; it was eminently noble and engaging. His stature was tall, and the carriage of his body graceful and courtly. His countenance was of the Roman model, with a tall, narrow forehead, the head "leaning persuasively forward." By an accident resulting from the bursting of a gun, in shooting swans on the Potomac, he had lost the four fingers of his left hand, and always wore upon it a black silk bandage; but in spite of this misfortune his gesture was so graceful that he was thought to have practised it before a mirror. Lee's disposition was gentle and amiable. He no doubt possessed that pride of race and sentiment of class which then characterized every man of ancient ancestry, and his scholarly habits probably made him appear exclusive and aristocratic in his feelings. There is sufficient proof, however, that he possessed a warm and kindly heart. The well authenticated instances of his open-handed charity, and the warm love which his brothers felt for him, indicate the amiability of his temper; and the many expressions of cordial affection in the letters addressed to him by his contemporaries, show that he had conciliated strong friend-

ships. His "Life and Correspondence" was published by his great-grandson, R. H. Lee (2 vols. 8vo, Philadelphia, 1825). **II. Francis Lightfoot**, one of the signers of the Declaration of Independence, born at Stratford, Westmoreland co., Va., Oct. 14, 1734, died in Richmond in 1797. Owing to the death of his father, he was not, like his brothers, sent abroad to complete his education; but under the direction of the Rev. Mr. Craig, a Scottish clergyman, who acted as private tutor at Stratford, he acquired a competent knowledge of the classics, and a great taste for reading and study. His father had left him an independent estate; and he entered with zest into those social occupations and enjoyments which were then a marked feature in the country life of Virginia. He had engaging manners, and is said to have been a favorite with ladies. From this round of enjoyments he was aroused by the struggle in the house of burgesses against parliament, and in 1765 took his seat there as a member from Loudon county, where his estate was situated. He proved a useful member, but did not distinguish himself as a speaker. He continued to sit till 1772, when, his term having expired, he left the house, was married to Rebecca, daughter of Col. John Tayloe of Richmond, and settled at Monocan in that county. In August, 1775, upon the resignation of Col. Bland, he was chosen by the house of burgesses a delegate to the general congress; and he was successively reelected in 1776, 1777, and 1778. During this whole period he seldom if ever appeared in debate, but acted upon many important committees, and frequently sat as chairman of the committee of the whole. His chief services in congress were the assistance he rendered in framing the old articles of confederation, and the stand which he took in favor of making the right to the northern fisheries and to the navigation of the Mississippi indispensable grounds in the conclusion of the treaty with England. These rights were finally guaranteed, and proved to be of primary importance. The gratitude of the New Englanders to the Lees appears in the correspondence of the period. Aspersions have been cast upon the "Lees of Virginia," the family being represented as hostile to Gen. Washington. The journals of congress sufficiently refute these charges. Richard Henry Lee advocated the scheme of investing Washington with larger powers, and Francis Lightfoot, the only one of the family at that time in congress, voted for a confirmation of the sentence of the court martial against Gen. Charles Lee after the battle of Monmouth, for which reason the latter would never afterward speak to him. He subsequently approved of and supported the federal constitution, on the avowed ground that "Gen. Washington was for it." In the spring of 1779 he retired from congress, and returned to plantation life. He was again called to represent his county in the senate of Virginia, but soon afterward finally abandoned the public

service. His love of ease and fondness for social enjoyment rendered a life in the country more agreeable to him than any other, and he resolutely adhered to his determination not again to engage in politics. His wife had borne him no children, but he was the centre of a large circle of friends. His "gay good humor and pleasing wit" made him a favorite with all, and his plain and easy manners rendered him approachable by persons of every class. He died within a few days of the death of his wife. **III. Arthur**, an American statesman, born in Westmoreland co., Va., Dec. 20, 1740, died in Middlesex co., Dec. 12, 1792. He was the youngest of the five brothers. After a brief course of tuition under a private teacher in Westmoreland, he was sent to Eton in England, where he formed intimate friendships with many youths who afterward became famous in public affairs. His father had designed him for the medical profession, and from Eton he passed to the university of Edinburgh, where he went through the course of general science and polite learning, studied medicine, receiving from the university the degree of M. D. and a diploma approving him a "general scholar," at that time esteemed a great honor. He also gained a gold medal for the best treatise "on some botanical subject," the subject of his paper being the character and uses of Peruvian bark. Leaving the university, he travelled through Germany and Holland, and finally returned to Williamsburg, the capital of Virginia, where he commenced the practice of his profession. He soon acquired reputation, but the threatening aspect of affairs drew him strongly toward political subjects. His brothers were already prominent in politics, and he determined to abandon his profession, return to England, and there embark in the struggle. Accordingly, about 1766 he proceeded to London, where he began the study of the law, which presented far greater allurements to his active mind than the practice of physic. He plunged with ardor into the angry current of newspaper debate. With a young student like himself he formed an intimate connection; this was William (afterward Sir William) Jones, and the correspondence between the friends was long and confidential. He was admitted to the bar in 1770, and began a successful and lucrative practice. He exerted himself in the cause of his native country with extraordinary vigor. His letters, under the signatures of "Junius Americanus" and "Monitor," became widely popular, and procured him the acquaintance and friendship of many of the most distinguished friends of American liberty. His opposition to the act declaratory of the right of parliament to tax the colonies, and to the subsequent stamp act, was warm and persevering; and such was the eloquence of one of his pamphlets, entitled "An Appeal to the English Nation," that it was long regarded as the work of Lord Chatham. As a member of a society of gentlemen of the oppo-

sition who styled themselves "supporters of the bill of rights," he drew up a preamble and resolutions setting forth the principles upon which the club was founded, and these papers were commented upon and praised by "Junius," who declared that Lee was "plainly a man of abilities, though a little unreasonable." In order to vote in municipal elections, he purchased the freedom of the city of London, and exerted himself actively in the opposition. By his influence, the complaints of America were introduced into Wilkes's Middlesex petition; and he obtained the passage of a resolution by the "supporters of the bill of rights" that the members of the club would support no man for parliament who would not give pledges in favor of permitting America to tax herself. About this period Lee was elected a fellow of the royal society, an honor which he resigned at the commencement of the war, on the ground that he could not consent to continue his connection with an English institution requiring pecuniary as well as literary contributions from its members, when England was at war with his native country. Lee's activity in the assertion of American rights soon brought his name prominently before the people of the colonies; and in 1770 he was appointed by the assembly of Massachusetts agent for that colony in case of the absence or death of Dr. Franklin, then holding that position in London. Between Franklin and himself a strong intimacy had sprung up, and the agent and his alternate consulted and acted in unison. The statement of his appointment is made by Lee in his manuscript entitled "Memoirs of the American Revolution," which he commenced in his latter years, but did not live to finish. When Franklin left England in 1774, Lee became sole agent for Massachusetts, and continued as such until he went to Paris. In 1774 he presented the addresses of congress to the people of England and to the king. Lord Dartmouth, to whom the petition to the king was presented, returned that "no answer could be given," whereupon Lee expressed to him his "sorrow that his majesty had adopted a measure which would occasion so much bloodshed." In November, 1775, congress appointed a committee of secret correspondence with the friends of the colonies in England and other countries, and Lee was chosen agent for the purpose in London. He applied himself to the duties of this commission with great activity; and in 1776, by order of the committee, he proceeded to Paris, to open friendly negotiations with the French government. His labors met with fair success. The count de Vergennes presented a memorial to the king, suggesting that it would be sound policy "to facilitate to the colonies the means of procuring, in the way of commerce, the articles and even the money which they needed; but without departing from neutrality, and without giving them direct succors." Through the French ambassador at the English court, Lee finally obtained the assurance that the government would secretly

furnish to the colonies £200,000 worth of arms and ammunition, to be transported from Holland to the West Indies. In September, 1776, congress proceeded to establish diplomatic intercourse with foreign nations; and Lee, Silas Deane, and afterward Dr. Franklin, were appointed commissioners to France. Lee had already accomplished two important objects. He had set on foot a private correspondence with the Spanish government, with the design of prevailing upon that court to unite with France in supplying the United States with money and arms; and had actually procured for the state of Virginia, from the royal arsenal of France, warlike stores of the value of nearly £260,000. The commissioners met in Paris in December, and decided that it was important for one of their number to proceed to Madrid. Lee was chosen, and set out in February, 1777. Soon after his departure, Franklin received from congress the appointment of commissioner to Spain, but declined it, and in May Lee was chosen in his place. As soon as the appointment became known in London, the English government, who were well acquainted with Lee's character, and no doubt divined the objects which he had in view, instructed their minister at Madrid to protest against his reception. Lee was accordingly met at Burgos by a messenger directing him not to proceed further. He returned an animated protest against this order, and the Spanish court finally withdrew it, permitting him to repair to the capital. Here he exerted himself with his accustomed activity, and presented to the government an eloquent memoir on "the present state of the dispute between America and Great Britain," the object of which was to establish the propriety of formally receiving a commissioner from the United States, and opening diplomatic intercourse with that country. He also drew up the plan of a treaty, and placed himself in communication with leading statesmen, persistently urging the adoption of a policy favorable to the cause of America. The government assured him of the good will of the king and the people, but adhered to a course of secrecy and caution. Ambiguous promises were plentifully made; but the only tangible success which Lee achieved was permission to make contracts for arms and ammunition with Spanish merchants. His residence at Madrid was of no slight importance, however, to the American cause. He impressed upon the minds of the statesmen of that country a high idea of the prospects and resources of America, and induced the court to instruct the Spanish minister at Paris to keep up a close and confidential intercourse with the American commissioners; and this intercourse finally enabled him to obtain a large and important loan. He returned to Paris, and found that his associates had during his absence opened negotiations with the Prussian minister. William Lee, brother of Arthur, had just been appointed commissioner to the court of Berlin; but as he already filled the

post of representative of the United States in Holland, where his services were needed, it was resolved that Arthur Lee should, without waiting to hear from congress, take his commission and instructions, and proceed immediately to Berlin. He accordingly left Paris in June, 1777, and repaired to the court of Frederick the Great. The obstacles before him were serious and discouraging. Prussia was not bound in any way to America, and was under treaty obligations with England. The objects of the commissioners were the establishment of commercial intercourse between Prussia and the United States; the prevention of assistance from Prussia to England in procuring German auxiliaries; the prohibition of the passage of such through the dominions of Frederick; and authority to purchase warlike stores from subjects of Prussia. In all these designs Lee fully succeeded. Frederick refused to receive him officially, and thus recognized the independence of the United States; but he was permitted to reside at Berlin as a private person, to carry on a secret correspondence with Baron Schulenberg, the minister of state, and to urge the claims of America as effectually as if he were her formally recognized representative. That his presence in Berlin speedily became known, and was regarded with suspicion and apprehension by the English envoy, is proved by an incident which occurred soon after his arrival. In his absence from the room which he occupied his door was opened by means of a false key, and all his papers were carried off. The servant of the English envoy lived at the same hotel, and Lee immediately addressed a communication to the minister, stating his suspicions, and complaining of the robbery. A note was returned by the king himself, declaring that the police would investigate the matter; and immediately afterward the papers were returned in the same mysterious manner. The affair was traced so clearly to the envoy that, at the king's request, he was recalled by his court. In his note on this occasion, Frederick tells Lee that he may speak without reserve to Schulenberg, and "assures him by the present of an inviolable secrecy, and that profound silence shall be observed with regard to those things that he shall communicate in this manner." When Lee left Berlin he was desired to keep the Prussian court well informed of the progress of the war in America, and assured that Prussia "would not be the last power to acknowledge the independency" of the United States. Thus the American commissioner had met with excellent success. He had accomplished every aim, except the formal recognition of his diplomatic position, and secured results of the first importance to America. On his return to Paris, a new field for his energetic exertions presented itself. Private letters from England informed him that some American prisoners there had been treated with great cruelty, and Lee set about correcting this

wrong with his accustomed vigor. He immediately brought the matter to the knowledge of his colleagues; and it was determined to address a memorial to Lord North, protesting against this harshness. The paper was drafted by Lee, and he also drew up a letter to Lord Shelburne, and despatched both papers to England. A memorial on the subject was also presented to the French court, aiming to secure the interposition of that government, nearly at the same moment when the American congress published its manifesto, proclaiming and justifying its determination to retaliate these cruelties. When the action of congress became known to the commissioners, they promptly announced it to the French and Spanish courts; but the whole subject was ere long overshadowed by the stirring intelligence of the surrender of Burgoyne at Saratoga. Lee despatched the good news to his hundreds of correspondents in Spain, Prussia, and other countries, and applied himself with renewed and ardent vigor to the task of inducing the governments of the continent to espouse the cause of America. The consequences of the triumph at Saratoga soon displayed themselves. The tone of the French court suddenly changed; and negotiations were at once commenced for the formation of a treaty of commerce and alliance. The progress of the negotiation was retarded by a dispute upon some points which Lee objected to. The first project of the treaty did not contain a recognition of the "sovereign" character of the United States; and the importance of this recognition was strongly pressed by Lee upon his colleagues. He also objected to those articles in which it was stipulated that no duties should be charged by the respective governments on any merchandise exported to the French West Indies which yielded molasses, or on the molasses exported thence to the United States. Lee opposed these articles as far too favorable to France, and declared that they gave her the right "to tie both of our hands," with the privilege in return on our part "of tying one of her fingers." It was finally determined that the decision should be left to congress, and the treaty was signed with this understanding by the commissioners. It was received in America "with the liveliest emotions of joy and gratitude;" but when its details came to be coolly considered, the objectionable articles were expunged, in accordance with the views of Lee. The treaty was nevertheless ratified by the French court, and the vexed questions were left open for subsequent negotiation. Soon after the signing of the treaty by the commissioners, Deane, between whom and Lee strong dissensions had occurred, was recalled, and John Adams was appointed in his place. It was through the exertions of Samuel Adams that Lee's early appointment of secret agent for the Massachusetts assembly had been conferred; and between himself and John Adams

commenced a warm friendship never afterward interrupted. This was a matter of some importance to Lee, inasmuch as the relations between him and Franklin were by no means amicable, and indeed soon became openly inimical. During the years 1778 and 1779 Lee continued in active employment, urging upon Spain and Holland the interests of America, and corresponding with the court of Prussia. He also acted as agent for Virginia in negotiating supplies of arms and stores. But a singular reward for his long devotion to the cause of America was about to be bestowed upon him. In the latter part of 1779 it became expedient to appoint a minister plenipotentiary to the court of Spain, and one or more commissioners to negotiate the proposed treaty of peace with England. Lee was nominated, but left out of both appointments. This affront was due to the machinations of his enemies. His colleague Deane on returning to the United States had published an address, in which he spoke of Lee in the grossest terms, and charged him with obstructing the alliance with France and disclosing the secrets of congress to British noblemen. The subordinate agents of America in Europe, employed to conduct the commercial details of public affairs, united also to attack Lee, whose vigilant eyes had detected and exposed their speculations. Through their correspondents in America they disseminated vague calumnies against him, and so persevering were their assaults that they ended by producing a strong effect upon the public mind, and even in shaping the action of congress. When Lee heard of his rejection by that body, he immediately resigned all his appointments, and in August, 1780, sailed for America, to demand an inquiry into his official conduct. He was received at Boston with indications of the highest esteem and respect; and these evidences of public regard were displayed everywhere on his journey to Philadelphia. He had prepared an elaborate report of his entire official proceedings as the agent of the United States, exposing the calumnies circulated against him, and now demanded of congress an opportunity to vindicate himself. His opponents, however, remained silent. It was no part of their plan to make an open accusation against him. The revulsion in Lee's favor seems to have been complete, for congress declared that no charge had ever been entertained against him, and that they had never intended to fix censure upon any portion of his public conduct. As a mark of their confidence, he was requested to lay before them his views, and the information which he possessed, upon foreign affairs. This was done, and Lee added a strict account of all the moneys received or disbursed by him for congress or the state of Virginia; and further published "Extracts from a Letter to Congress, in answer to a Libel by Silas Deane." He then returned to his native state, but was not permitted to remain in retirement. In the spring of 1781 he was elected from the county

of Prince William a delegate to the general assembly. He was a landholder in the county, but did not reside there, and an election under these circumstances has always indicated in Virginia extended public confidence. The assembly appointed him a delegate to congress, and in that body he served from February, 1782, till 1785. Like his brothers, with the single exception of Richard Henry, he was an indifferent speaker, but took a large share in the business of the body. In 1784 he was appointed by congress one of the commissioners to conclude a treaty with the Indians on the N. W. frontier, and prepared a valuable account of the character of the country through which he passed. Lafayette accompanied the expedition, and assisted it by his name and advice. Lee remained with his associates at Fort Stanwix throughout the winter, and treaties were concluded to the satisfaction of congress and the country. On his return he was appointed to the board of treasury with Samuel Osgood and Walter Livingston, in which he continued from 1784 to 1789. In 1786 he was chosen by the general assembly of Virginia one of the commissioners to revise the laws of the commonwealth, and aided greatly in that task. When the board of treasury was dissolved in 1789, he retired finally from public employment, and, purchasing an estate in Middlesex county, applied himself to agricultural pursuits. He continued however to take an interest in politics, and "solemnly investigated" the character of the new federal constitution. He regarded the original instrument with jealousy and dislike, as too strongly tending toward consolidation; but the subsequent amendments greatly changed his opinion of it. During his latter years he carried on an extensive and interesting correspondence with many of the distinguished personages with whom his official career had thrown him in contact. Among these were Burke, Col. Barré, Wyndham, Sir William Jones, the marquis of Lansdowne, and the earl of Buchan; and on the continent, the baron de Breteuil, the abbé Raynal, the duke de la Rochefoucauld, and others. He also corresponded with many persons of literary and political eminence in the United States. This correspondence has been published, and is highly interesting. He was devoted to the improvement of the grounds around his hospitable mansion, and in planting an orchard contracted a pleurisy which proved fatal.—The career of Arthur Lee was one of the most important and useful to his country which the history of that day records. The transient cloud which rested upon his name, from the machinations of those whose speculations of the public money he had exposed, soon passed away without effort upon his part; and when he retired from public affairs, he carried with him the respect and confidence of the best and most celebrated men of his epoch. His face was striking and handsome, his eyes blue and brilliant, and his person pleasing.

His acquirements, exclusive of his medical knowledge, seem to have been extensive. He has been justly styled "the scholar, the writer, the philosopher, and negotiator," and in all these capacities he labored faithfully for the public good. He never married.—His "Life and Correspondence" was published by his grand-nephew, R. H. Lee (3 vols. 8vo, Boston, 1829).

**LEE, Alfred**, an American clergyman, bishop of the Protestant Episcopal church in Delaware, born in Cambridge, Mass., Sept. 9, 1807. He graduated at Harvard college in 1827, studied law, and practised for a time, but subsequently studied for the ministry in the general theological seminary in New York. He became rector of the Episcopal church at Rockdale, Del., in 1838. He was consecrated bishop of Delaware in October, 1841, and became rector of St. Andrew's church, Wilmington, where he still resides. He is the author of a "Life of the Apostle Peter, in a Series of Practical Discourses" (12mo, New York, 1852; London, 1853); "Life of St. John" (1854); "Treatise on Baptism" (1854); "Memoir of Miss Susan Allibone" (1856); and "Harbinger of Christ" (1857). He has received the honorary degree of S. T. D. from Trinity college, Hartford.

**LEE, Ann**, the founder of the sect of Shakers in America, born in Manchester, England, Feb. 29, 1736, died in Watervliet, N. Y., Sept. 8, 1784. Her parents were members of a distinct branch of the society of Friends, and too poor to afford their children even the rudiments of education. She was early married to Abraham Stanley, by whom she had four children who died in infancy. She became in 1758 a member of the Manchester society of Friends, and in 1770 she professed to have received a divine mission to deliver her "testimony against all lustful gratifications as the source and foundation of human corruption and misery." Her peculiarity of manner and the novelty of the doctrines she preached subjected her at first to abuse, and she was at length confined in prison by the authorities of Manchester for several weeks. During this imprisonment, Christ, she said, revealed to her in a vision the most astonishing views and divine manifestations of truth; and after her release she was regarded by her sect as "a mother in spiritual things," and was always called by them "Mother Ann." In 1774 Ann Lee, with others of her sect, including her husband and a brother and niece, emigrated to New York, for the purpose of establishing there the "church of Christ's second appearing." The company separated for a time in order to seek employment and the means of subsistence; but about 1776 they were reunited in the present town of Watervliet, near Albany, where Ann Lee, who had previously formally dissolved her connection with her husband, became their recognized head. In 1780, during a religious revival in New Lebanon and several adjoining towns, the company first brought itself into notice, and under the influence of Ann Lee many persons were

converted to their doctrines. In this movement originated the flourishing society at New Lebanon. They incurred, however, the suspicion of the local authorities with regard to their friendliness to the patriotic cause, and Ann and others were imprisoned for several months for refusing to take the oath of allegiance to the state of New York, it being contrary to their faith. They were released without a trial by order of Gov. George Clinton in the latter part of 1780. In 1781-'8 Ann Lee and the elders of the society at Watervliet made a missionary journey through New England, in the course of which societies were founded in Harvard, Mass., and other places. She died about a year after her return.—See "Ann Lee, or Shakers and Shakerism," by F. W. Evans.

**LEE, Charles**, a major general in the American revolutionary army, born at Dernhall, Cheshire, England, in 1731, died in Philadelphia, Oct. 2, 1782. He was the youngest son of John Lee, colonel of the 44th regiment in the British service, and is said to have held a commission in the army when 11 years of age. He received a tolerable education, and early prepared himself for his profession by studying the science of war. At 20 years of age he became a lieutenant in the 44th regiment, and in 1754 accompanied the troops sent to America, where during the next six years he saw considerable service. The 44th was one of the two European regiments which followed Braddock in his expedition to Fort Duquesne, and at the disastrous battle on the Monongahela Lee received his first practical experience of warfare. He found his way in safety to Philadelphia with the remnant of the British army, participated in the various indecisive movements of the campaigns of 1756 and 1757 as captain of a company of grenadiers, and in 1758 was present in the assault on Ticonderoga, where he was severely wounded by a musket shot. He subsequently traversed a large portion of the western frontier, and after the reduction of Fort Niagara and Montreal in 1760 returned to England, where he was promoted to a majority in the 103d regiment of foot. This regiment was disbanded in 1763, and Lee continued a major on half pay till 1772, when he was made a lieutenant colonel on half pay, which was the highest rank he ever attained in the British service. In 1762 he accompanied the British army sent to Portugal to protect the frontiers of that country from the incursions of the Spaniards, and while in the brigade of Gen. Burgoyne distinguished himself by a brilliant night attack upon a Spanish post near the old Moorish castle of Villa Velha, which the commander-in-chief, Count Lippe, described as "a very gallant action." But notwithstanding this testimonial to his bravery, and others equally complimentary from the king of Portugal and influential friends, his promotion lagged. Various reasons have been assigned for this, the most probable being

the freedom with which he discussed ministerial plans respecting America, and in general his severe strictures upon persons in authority. He was by nature impulsive, restless, opinionated, and overbearing, and his unhappy temper interfered on many occasions with the advancement to which his talents in reality entitled him. The Mohawks, into whose tribe he was adopted during his residence in America, aptly named him Ounewaterika, "Boiling Water." Wearied with the inactive life of a half-pay officer, he visited the continent with recommendations from his former commander, was well received by Frederick the Great, and at Warsaw was appointed by King Stanislas Augustus one of his aides-de-camp, an office of honor, however, rather than employment. In the latter part of 1766 he returned to England, bearing a letter of recommendation from Stanislas Augustus to George III., and made urgent attempts to obtain promotion, or at least a military command. His meddling disposition again interfered with his advancement; and in consequence of some sarcasms directed against the military character of Gen. Townshend and Lord George Sackville, he found the door of promotion shut against him. The disappointment attending the ill success of this attempt rankled in his breast and affected his whole subsequent career. Returning to Poland in 1769, he was made a major general in the Polish service, subsequently served for a short time in the Russian army in a campaign against the Turks on the Pruth, and for a year or two pursued a restless, wandering life through southern Europe. In Italy he fought a duel with a foreign officer, in which the latter was killed; and in the course of his life he became involved in many similar affairs, from which his courage and address generally enabled him to escape unharmed. In 1773 he was again in England with a temper soured by ten years' unavailing struggle for preferment, venting his spleen against the ministry in squibs and newspaper articles full of irony and sarcasm, and systematically opposing every project emanating from government. He had some reputation as a political writer, and, according to Thomas Rodney of Delaware, confessed to that gentleman in 1773 that he was the author of the letters of Junius. Upon this statement and other circumstances an attempt was subsequently made by Dr. Thomas Girdlestone to prove that Lee and Junius were identical. It has been supposed by some that his vanity induced him to claim the letters as his own. The threatening aspect of affairs in America meanwhile suggested to him a sphere of action in which his hatred of ministerial oppression might find a wider sympathy than at home; and in the summer of 1773 he left England for ever, arriving in New York in October. His reputation as a caustic writer on the liberal side in politics, and to a certain degree as a general of European experience and renown, caused his arrival in the country to be hailed

as an acquisition to the patriotic cause. During 1773-'4 he travelled extensively through the colonies, cultivating the acquaintance of prominent whigs, vigorously upholding with pen and tongue the claims of the people, and expressing both in his correspondence and conversation great enthusiasm for freedom. Writing to Gates, an old fellow campaigner in America, under date of May 6, 1774, he says: "For my own part, I am determined (at least I think I am) not to be slack in whatever mode my service is required." In the same year he wrote his "Strictures on a Pamphlet entitled 'A Friendly Address to all Reasonable Americans,'" in reply to Dr. Myles Cooper, a tory clergyman of New York; this was one of the ablest of his literary performances, and was widely circulated, and read with avidity by all classes. The freedom with which he avowed his sentiments did not fail to arouse the suspicions of the British ministry; and his presence in Boston during the summer of 1774, where he associated with the leading patriots, induced Lord Dartmouth to warn Gen. Gage to "have an attention to his conduct, and to take every legal method to prevent his effecting any of those dangerous purposes he is said to have in view." He was present at Philadelphia during the session of the first continental congress, animating its members by his own zeal; and about the same time, as if to identify himself completely with the colonists in their impending struggle with the mother country, he purchased an estate of 2,400 acres in Berkeley co., Va., in the neighborhood of his friend Gates. Congress having determined after the combats at Lexington and Concord to organize a continental army, Lee was, on June 17, 1775, appointed the second major general, ranking after Gen. Artemas Ward, then first in command of the New England troops encamped around Boston. Though disappointed in not receiving a higher command, to which in the opinion of many his efforts in behalf of the colonies as well as his military talents and experience entitled him, he accepted the appointment, first, however, in a letter to the British secretary at war, resigning his commission in his majesty's service, and declaring his readiness to serve the king whenever called upon "to act against the enemies of his country or in defence of his just rights and dignity." Although he was accustomed to refer to this act of his life as one which involved the confiscation of his property in England, it is proper to remark that after a conference with a committee appointed at his own request, in which he unfolded his pecuniary circumstances, congress undertook to indemnify him for any loss he might sustain by entering into their service, and subsequently advanced him \$30,000 for that purpose. Early in July, in company with Washington, he arrived at the camp at Cambridge, and formally entered the service, "a soldier of fortune," says Irving, "indifferent to the ties of home and country, drawing his

sword without enthusiasm, more through resentment against a government which had disappointed him, than zeal for liberty or for colonial rights." During the summer and autumn he held command of the left wing of the American army posted on Winter hill, sustaining his reputation as a military authority, although his manners were far from agreeable, and the opinion began to gain strength that personal ambition was his main incentive in embarking in the cause of the colonies. In November, 1775, he visited Newport, R. I., for the purpose of erecting works of defence, gratifying his hatred of Tories while there by making them take a "tremendous oath" to support the authority of congress; and in February, 1776, he was sent on a similar mission to New York, whence in March he departed for Virginia to take command of the southern department. After organizing the military defence of that colony, he marched in the latter part of May toward Charleston to meet the forces which it was apprehended were to be landed from the British fleet under Sir Peter Parker. He arrived in the city June 4, and at once reported it "utterly defenceless." The fort then building on Sullivan's island he particularly objected to, predicting that it could not hold out half an hour, and calling it a "slaughter pen;" and he endeavored, though unsuccessfully, to persuade Gov. Rutledge to abandon it. During the memorable defence of the work by Col. Moultrie, June 28, he took no measures to support the garrison, and, instead of supplying them with ammunition when their stock was exhausted, counselled them to spike their guns and retreat. Nevertheless, much of the credit of the successful defence of Charleston was ascribed to him, and he returned to the north in the autumn with an enhanced military reputation, and an exaggerated notion of his own importance to the American cause. He was now, by the resignation of Gen. Ward, first major general, occupying the second rank in the army; and many persons, contrasting his presumed successes in the south with the recent defeat on Long Island, began to consider him the main hope of the American arms. On Oct. 14 he joined the camp on Harlem heights, and with his customary good fortune received the credit of advising the evacuation of New York island and the retrograde movement by which the plans of Howe for surrounding the American army were defeated, although the chief features of the plan had been determined upon a month previous. His division covered the retreat of the American army over King's bridge; and after the passage of Washington into New Jersey, he was left in Westchester county, in the neighborhood of New York, in command of a force of 7,000 men. The possession of a separate command flattered his vanity, and, impressed with the idea of attacking New York, or assailing the rear of the enemy, or performing some other exploit equally brilliant, he

lingered week after week in Westchester, notwithstanding urgent appeals from Washington to join him in New Jersey; and after crossing the Hudson at Haverstraw, Dec. 2-4, he pursued his march southward with equal dilatoriness. Being "in hopes to reconquer the Jerseys," he moved in a road about 20 m. west of the British army, and, disregarding the directions of Washington, awaited the opportunity which he expected would soon present itself to make an independent demonstration on the enemy's flank. On the morning of Dec. 13, while quartered with his aides and a small guard at White's tavern, Baskingridge, about three miles from his army, which was left under the command of Gen. Sullivan, he was surprised and captured by a party of British light horse under Col. Harcourt, who had received intelligence of his movements from a Tory of the neighborhood. After a brief resistance Lee surrendered himself, according to the British accounts, in the most cowardly manner, and was hastily mounted behind one of the troopers, and carried away at full speed to the British camp at New Brunswick, whence about three hours afterward the booming of cannon proclaimed the exultation of the enemy at the capture of the "American Palladium," as Lee was styled by them. Notwithstanding the unfavorable suspicions which the circumstances attending his capture have provoked, there seems no reason to believe that he was then acting a treacherous part, or that he was guilty of any graver offence than negligence or disobedience of orders. The Americans sincerely deplored his loss, and upon learning that he was regarded by his captors as amenable to British military law as a deserter, congress at once adopted retaliatory measures, and ordered five Hessian field officers and Lieut. Col. Campbell to be taken into close custody, to await the fate of Lee. In consequence of the firm stand taken by congress, Gen. Howe advised the British ministry to countermand their first instructions that Lee should be sent to England for trial, and to allow him to be considered a prisoner of war. A reluctant consent having been obtained, he was, in December, 1777, put upon parole, and treated with the consideration usually bestowed upon prisoners of rank. During the period that his fate was involved in uncertainty, his interest in the colonial cause seems to have yielded to solicitude for his personal safety; and the evidence is now strong that for the purpose of securing this end he was willing to betray his adopted country. From a recently discovered document in Lee's handwriting, indorsed by Henry Strachey, secretary to the royal commissioners, Lord and Sir William Howe, as "Mr. Lee's Plan," it appears that on March 29, 1777, he submitted to the British commander a project for the reconquest of America, the chief feature of which was the concentration of forces at Annapolis and Alexandria for the purpose of cutting off com-

munication between the northern and southern states; the result of which would be, that while the advance of Burgoyne from the north would give sufficient occupation to New England and New York, Howe could overwhelm the American army in New Jersey, thus "unhinging and dissolving the whole system of defence." Upon this document, the authenticity of which is deemed incontrovertible, an elaborate paper, entitled "The Treason of Charles Lee," was read before the New York historical society by George H. Moore in June, 1858, and afterward separately published. The mysterious expedition of the Howes with the British fleet southward in the summer of 1777, it is supposed, may be explained by a reference to this plan; and Lee's request to congress, during his captivity, to be permitted to communicate to a committee of their body matters of interest to the public and to himself, may be in like manner referred to his desire to be of service to the crown in reopening negotiations with congress. In May, 1778, he was exchanged for Gen. Prescott, and joined the American camp at Valley Forge, where he received the command of a division. In the general council of officers held in the succeeding month he strongly opposed the project of attacking the British army on their march from Philadelphia through New Jersey; and he subsequently commanded the advance at the battle of Monmouth, June 28, after formally resigning the post to Lafayette. His wilful conduct on this occasion in ordering a retreat by which the day was nearly lost, against the express command of Washington, who was hurrying forward to his support with the main body of the American army, was the occasion of an outbreak of anger on the part of the commander-in-chief which was long remembered by those who witnessed it. Some, who had noted Lee's opposition to any project for attacking the enemy, were led to suspect that he was secretly aiding them by endeavoring to procure a defeat of the Americans. It appeared afterward that his division, consisting largely of militia, had been unexpectedly attacked by the whole rear guard of the British army, and that some little confusion at first prevailed in the American ranks; but after putting the most favorable construction upon his conduct, it is impossible to absolve him from the charge of irresolution and negligence unworthy of a commanding officer. Such was substantially the verdict of the court martial convened to examine into his conduct at Monmouth, who also found him guilty of writing disrespectful letters to the commander-in-chief, and sentenced him to suspension from any command in the army for one year. He was not prepared for this sentence, having expected from the ingenuity and ability of his defence to be triumphantly acquitted; and during the delay of congress to affirm it, his naturally irascible temper betrayed him into frequent acts of imprudence, which only increased the

feeling of suspicion and dislike with which he was beginning to be regarded. For the disparaging manner in which he spoke of Washington he was challenged by Col. John Laurens, one of the latter's aides, and was wounded in the side by a pistol ball in the duel which ensued. Congress having ratified his sentence, he retired to his estate in Virginia, where he wrote for the "Maryland Journal" his "Queries, Political and Military," the drift of which was to cast a slur upon the character and military conduct of Washington. He inhabited a house rudely and hastily constructed, without partitions, and almost without the necessary furniture, where, surrounded by his dogs, of which he was immoderately fond, and his books, he lived "more like a hermit than a citizen of the world." The divisions of the apartments were marked by lines of chalk, which he claimed was an improvement upon walls. The term of his suspension had just expired when a rumor reached him that congress designed to deprive him of his commission. In a sudden fit of anger he despatched to the president of that body an insulting note, the result of which was his immediate dismissal from the service. He soon wearied of the life of a planter, and in the autumn of 1782 visited Baltimore and Philadelphia with a view of negotiating for the sale of his estate. In the latter place he was attacked by a fever of which he died within five days, exclaiming in the delirium of his last moments: "Stand by me, my brave grenadiers." With characteristic eccentricity he directed in his will that his body should not be interred in any church or church yard, or within a mile of any Presbyterian or Anabaptist church. He was, however, buried in the cemetery of Christ church, whither his remains were attended by a large concourse, including many whom his wayward conduct had not entirely alienated, and who gratefully remembered his early efforts for colonial freedom, and his occasional generous acts and impulses. His memoirs have been written by Edward Langworthy, by his kinsman Sir Henry Bunbury, and by Jared Sparks in his "Library of American Biography."

**LEE, Charles Alfred**, an American physician, born at Salisbury, Conn., March 3, 1801, died at Peekskill, N. Y., Feb. 14, 1872. He graduated in medicine at the Berkshire medical institution in Pittsfield, Mass., in 1825, and became widely known as a teacher and writer upon medical subjects. He held professorships at various times, chiefly of materia medica and obstetrics, in the medical department of the university of the city of New York, the Geneva medical college, at Geneva, N. Y., the medical department of the university of Buffalo, the Berkshire medical institution, the Maine medical college at Brunswick, the Vermont medical college at Woodstock, and the Columbus medical college, Ohio. He conducted for some years the "New York Journal of Medicine," and edited the American edition of

Copland's "Dictionary of Practical Medicine" (New York, 1844-'58), besides making many communications on various subjects to the medical periodicals. His last work, published shortly before his death, was "Remarks on Wines and Alcohol" ("Journal of Materia Medica," September and October, 1871).

**LEE, Eliza Buckminster**, an American authoress, born in Portsmouth, N. H., about 1790, died in Brookline, Mass., June 22, 1864. She was a daughter of the Rev. Dr. Joseph Buckminster, from whom as well as from her brother, the Rev. Joseph Stevens Buckminster, she acquired a classical education and a fondness for literary pursuits. She was married to Mr. Thomas Lee of Boston, in which city and its vicinity the greater part of her life was passed. Her career as an authoress commenced with the publication of "Sketches of a New England Village" (1837), followed by "Delusion." In 1842 appeared her "Life of Jean Paul Richter" (New York), translated from the German, and in 1845 she published "Walt and Vult, or the Twins," from Richter's *Fliegeljahre*. Her remaining works are: "Naomi, or Boston Two Hundred Years Ago" (Boston, 1848); "Memoir of Rev. Dr. Buckminster and Joseph Stevens Buckminster" (1849); "Florence, the Parish Orphan" (1850); "Parthenia, or the Last Days of Paganism" (1858); and "The Barefooted Maiden," a translation from Auerbach.

**LEE, Ezra**, an American revolutionary soldier, born in Connecticut in 1749, died in Lyme, Conn., in 1821. In August, 1776, he volunteered on the hazardous enterprise of affixing Bushnell's infernal machine to the British ship Eagle, then lying in New York harbor; but the attempt, owing to the thickness of her copper sheathing, was only partially successful. He landed safely after remaining several hours in the water, and received the congratulations of Washington. He served with credit at Monmouth and in other battles of the revolution.

**LEE, Hannah F. (SAWYER)**, an American authoress, born in Newburyport, Mass., in 1780, died in Boston, Dec. 28, 1865. She was the daughter of a physician of eminence in her native place, and for many years resided in Boston. Her first known publication was the appendix to Miss Hannah Adams's memoir of herself, which was succeeded by "Grace Seymour," a novel, and "Three Experiments of Living," published in 1838. The subject of the latter work was suggested by the commercial disasters of the time; it has passed through upward of 30 editions in the United States, besides many in Europe, and is esteemed her best work. Her remaining works are: "The Old Painters;" "Eleanor Fulton," a sequel to "Three Experiments of Living;" "Rich Enough;" "Luther and his Times;" "Cramer and his Times;" "The Huguenots in France and America;" "The World before You;" "Stories from Life" (1849); "Memoir

of Pierre Toussaint" (1853); and "History of Sculpture and Sculptors" (1854).

**LEE, Henry**, an American soldier, born in Westmoreland co., Va., Jan. 29, 1756, died at Cumberland island, Ga., March 25, 1818. His father was Henry Lee, first cousin of Richard Henry, Francis Lightfoot, and Arthur Lee; his mother was Mary Bland, daughter of Col. Bland of Jordans, in Prince George co., Va. He received his early education from a private tutor, and was afterward sent to Princeton college, then presided over by Dr. Witherspoon. While at college Dr. Shippen predicted his future distinction. He graduated in 1774, in his 18th year, and returning home took charge of all the private affairs of his father, who was then engaged in negotiating a treaty with some Indian tribes on behalf of the colony. This charge he executed with great prudence, industry, and ability for one so young. In 1776, when 20 years of age, he was appointed, on the nomination of Patrick Henry, captain of a company of cavalry in Col. Theodore Bland's "Virginia regiment," and in September, 1777, marched with his regiment to join the main army. He soon distinguished himself by the excellent discipline which he introduced into his company, the care which he took of his men and horses, and by skirmishing, foraging, and procuring information of the movements of the enemy. He was enabled by his strict discipline to move with celerity and effect, and seems at once to have adopted that rapid and daring system of tactics which made "Lee's legion" afterward so efficient in the south. It is certain that his vigilance and zeal secured for him the respect and confidence of Washington, who selected Capt. Lee's company for his body guard at the battle of Germantown. The enemy seem also to have formed a high opinion of his abilities, and of the importance of taking him prisoner. In January, 1778, it was discovered that Capt. Lee, with only ten men, was at a stone house not far from the British lines. A design was immediately formed to capture him; and 200 troopers were detached to make a circuit and fall upon him by surprise. The troopers approached without his knowledge, seized four of his patrols who were prowling in search of forage, and attacked him before he was aware of their vicinity. He made a desperate defence, and the enemy were forced to retire with a loss of four killed, and one officer and three privates wounded. Of his own men, besides the patrols and the quartermaster sergeant, who were made prisoners, he had but two wounded. Washington wrote him a letter complimenting him upon his gallantry on this occasion, and he was soon afterward raised to the rank of major, with the command of an independent partisan corps of two companies of cavalry, subsequently enlarged to three, and a body of infantry. He continued in active service, and on July 19, 1779, at the head of a body of 300 men, surprised the British garrison

at Paulus Hook, took 160 prisoners, and effected his retreat with the loss of only two men killed and three wounded. For the "prudence, address, and bravery" which he displayed in this affair, congress voted him a gold medal. In January, 1781, he marched his legion to the south, and joined the army of Greene, with the rank of lieutenant colonel. In the great retreat of Greene before Lord Cornwallis, Lee's legion formed the rear guard of the American army, the post of greatest danger. The pursuit was hot, and at one time the rear guard came in contact with the troopers of Tarleton. Lee charged Tarleton, killed 18 of his men, and took one captain and several privates prisoners. When Greene had effected his retreat, he despatched Lee and Col. Pickens into North Carolina, to watch and harass the movements of Cornwallis. On their march they fell in with a couple of messengers from Col. Pyle, commander of a body of 400 Tories, to Cornwallis. The messengers, supposing from the accoutrements of the troopers that Lee was Tarleton, communicated to him the substance of their instructions, which embraced full information of Pyle's intended movements. Lee did not undeceive them, personated Tarleton throughout, and despatched one of the messengers back to Pyle, directing him to post himself with his force at a place which he indicated. The Tories accordingly took their position, and the troopers came up with them, and charged and defeated them, killing 90, and taking others prisoners. At the battle of Guilford Court House Lee performed very important services, and greatly distinguished himself. On the morning of the day of battle he encountered Tarleton's celebrated troop of cavalry, and drove them back with considerable loss. In the main engagement he was stationed with his legion on the left wing of Greene's army; and although the body of militia which composed the principal force attached to his position abandoned him at the very commencement of the action, Lee obstinately held his ground, and kept the enemy at bay until he received the order to fall back upon the main body, whose retreat he covered. It was by the advice of Lee that Greene came to his celebrated and daring decision not to follow Cornwallis into Virginia, but to leave that province to its fate, and march southward, with the view of ending the conflict in South Carolina and Georgia. The praise or blame attached to this extreme step must therefore be shared between the two commanders. The result is known, and fully vindicated the expediency of the movement, cruel as it appeared to Virginia in her prostrate condition. In pursuance of his plan of operations, Greene detached Lee with his legion to join the body of partisans under Marion, and fall upon the lesser posts of the enemy. By a series of vigorous operations, Forts Watson, Motte, and Granby were speedily compelled to surrender; and Lee was then ordered to join Pickens, and

assist in the attack upon Augusta. On his way he surprised and took Fort Galphin. The defences of Augusta consisted of Fort Cornwallis and Fort Grierson. The latter was taken by assault, and the former at the end of a siege of 16 days. Col. Brown, its commander, was particularly obnoxious to the Americans, and his life was only preserved by the interposition of Lee. That officer marched with his prisoners to rejoin the army of Greene, which had sat down before Fort Ninety-Six. Lee was intrusted with an important position when the attempt was made to take the place by storm. He led the assault with his habitual daring, and was completely successful; but the other division failed in its object, and the advance of Lord Rawdon compelled Greene to abandon the siege. His gallantry at the battle of Eutaw Springs contributed largely to the result of that action. His legion covered the right flank, and when the militia gave ground before the enemy, he obstinately maintained his position unsupported. His order to Capt. Rudolph, of the infantry corps attached to his legion, to turn the enemy's flank, and give them a raking fire, resulted in the retreat of the left wing of the British forces, which were completely broken, and driven from the field. The charge upon the enemy's right was not so fortunate, and the Americans were compelled to retire. It is more than probable that Lee's impetuous charge alone saved the army from defeat. The revolutionary struggle was now drawing to a close. Greene had rightly supposed that the main army under Washington was more than a match for the force of Cornwallis. In October, soon after the battle of Eutaw, Lee was sent on a special mission to Washington, with the request from Greene that he would prevail on the count de Grasse to afford naval assistance in the proposed siege of Charleston; and he arrived at Yorktown about the period of the surrender of Cornwallis. Lee's relations with Greene have been misrepresented by the partisan adherents of that great and excellent man. Lee fancied that he had been injured by the neglect of Greene to speak of him in his general reports as his services deserved; and a correspondence ensued upon the subject in 1782. The general declared that Lee's wish to retire originated, he believed, in "distress" rather than the injuries which his health had undergone, and combated his resolution in a tone of affectionate remonstrance. He had been under obligations to Lee, he said, which he could "never cancel." As to his military services, Greene wrote: "I believe that few officers, either in Europe or America, are held in so high a point of estimation as you are. . . . Everybody knows I have the highest opinion of you as an officer, and you know I love you as a friend. No man in the progress of the campaign had equal merit with yourself." The friendly relations afterward subsisting between these two eminent men, and the manner in which Lee speaks

of Greene in his memoirs of the southern campaign, show that this temporary misunderstanding did not continue. Finding his services no longer necessary, however, Lee retired from the army, and returned to Virginia. He settled down at Stratford, the old family mansion in Westmoreland, and was soon afterward married to his cousin Matilda, daughter of Philip Ludwell Lee. Upon the death of this lady, he married Ann, daughter of Charles Carter. In 1786 he was appointed by the Virginia assembly one of the delegates to congress, in which body he remained until the federal constitution went into operation. In 1788 he was a member of the Virginia convention to decide upon the adoption of the proposed instrument, and took a prominent position among the advocates of the measure. He subsequently served in the Virginia house of delegates, and in 1792 was elected governor of the commonwealth for the term of three years. In 1794 occurred the whiskey insurrection in Pennsylvania. Every peaceable attempt to suppress the outbreak having failed, the president ordered a military force to be raised, which he placed under the command of Lee. The advance of the well known partisan of the revolution at the head of 15,000 men speedily terminated all resistance, and Lee soon returned to Virginia. In 1799 he again served in congress; and when intelligence was received of the death of Washington he was appointed by the house to pronounce a eulogium. The resolutions which he drew up on this occasion, and which were presented during his temporary absence by his friend Judge Marshall, contained the words now so celebrated: "First in war, first in peace, and first in the hearts of his countrymen." On the election of Jefferson to the presidency in 1801, Lee retired from public affairs, and established himself as a country gentleman in Virginia. The remainder of his life was not, however, to be tranquil. The profuse hospitality and free mode of living then the fashion plunged him into pecuniary trouble, and terminated in the ruin of his estate. He was even arrested for debt, and, if the statement of some persons is to be credited, lodged in the jail of Spottsylvania. The more probable account is, that he was confined within "the limits" of that county only. Here, in the year 1809, he wrote his "Memoirs of the War in the Southern Department of the United States," which deservedly ranks among the most valuable and interesting works of a similar description. It seems to have been largely based upon communications from his brother officers, is written with candor and impartiality, and possesses the charm peculiar to writers who have witnessed with their own eyes the scenes which they describe. In 1811 he took up his residence at Alexandria, Va., where his family remained after his death. Few subsequent traces of the life of Lee remain, up to the year 1814. He seems to have been harassed by pecuniary trouble, but not to have discarded his habits of

free living. In 1814 he was in Baltimore when the riots connected with the "Federal Republican" newspaper took place, and exposed himself by the part which he took in them to serious injury. The printing office of the journal was destroyed by the mob, and an attack upon the dwelling of the editor followed. Lee was a personal friend of this gentleman, and with characteristic impetuosity offered to aid him in defending his house. The result was that two of the assailants were killed, and a number wounded; which so inflamed the rage of the crowd, that but for the arrival of the city military Lee and his friends would in all probability have been torn to pieces. They were conducted by the military to the city jail for safety; but during the night the mob reassembled in greater force, broke open the jail, and either killed or shockingly maimed all its inmates. From the injuries which he received on this occasion Lee never recovered. He made a voyage to the West Indies for the restoration of his health, but all his hopes failed. Finding his strength giving way, he returned to the United States in 1818.—In person Lee was above the medium height, well proportioned, and pleasing. His complexion was dark; his manner the frank and open address of a soldier. Self-esteem, based upon the conscious possession of commanding talents, was a marked trait of his character; and in this doubtless originated his misunderstanding with Greene. The opinion formed by that great soldier of his military genius has been stated. The "love and thanks" expressed in a letter to Lee from Gen. Washington in 1789, exhibit the affection which his generous qualities had inspired in the bosom of the chief; and in Virginia he is still known by the name of "Legion Harry" or "Light Horse Harry," in allusion to the rapid and daring movements of his partisan corps in the campaign of the Carolinas. He was father of Robert E. Lee, commander-in-chief of the confederate armies in the civil war.

**LEE, Jesse**, "the Apostle of Methodism in New England," born in Prince George co., Va., March 12, 1758, died in Baltimore, Sept. 12, 1816. At the age of 19 he removed to North Carolina, and in 1779 he preached his first sermon. His ministerial career was interrupted in 1780 by being drafted into the militia to repel the invasion of the British into South Carolina. Refusing to do active military duty, during the four months of his impressment he performed the duties of a chaplain. His first appointment was near Edenton, N. C., and in 1783 he was received into the conference on trial. Being appointed to the Salisbury circuit, N. C., in 1784, he also accompanied Asbury on an extended tour of labor extending from Norfolk, Va., to the extreme S. W. portions of North Carolina, and reorganized the various circuits that had been nearly destroyed by the war. After three years spent in North Carolina, Virginia, Maryland, and New Jersey, at the conference of 1789 he was sent to Stam-

ford circuit, Conn. The peculiarities of Lee's preaching awakened general attention. After visiting Norwalk, New Haven, and other towns, and establishing classes, he visited Boston in 1790, and preached his first sermon on the common. For six years he travelled throughout nearly all New England, penetrating to the remotest N. E. portions, preaching in private houses, in barns, and on the highways, forming new circuits, and directing the labors of his assistants. In 1796 he became an assistant to Asbury in preaching, holding conferences, and superintending the churches. Subsequently to 1800 he spent most of his time in the south. He ever studied the interests of the church, and aimed to perfect her polity. In 1808 he advocated a delegated general conference, a plan that had been suggested by him 14 years before; and this plan was adopted soon after, the general conference thus becoming the supreme authority of the Methodist Episcopal church. In 1807, 1812, and 1813 he was elected chaplain of the house of representatives at Washington, and in 1814 the senate, which office he filled to the time of his death. In 1807 he published a "History of Methodism," which was the first work on that subject, and is a most valuable authority on the early history of this church.—See "Life and Times of Jesse Lee," by Leroy M. Lee (Richmond, 1848).

**LEE, Leroy Madison**, an American clergyman, born in Petersburg, Va., April 30, 1808. He studied law, but entered the ministry of the Methodist Episcopal church in 1828. He occupied important stations in the Virginia conference till 1836, when he was appointed editor of the "Richmond Christian Advocate." He was a member of the general conference of 1844, and took an active part in the events which resulted in the division of the church, and likewise represented the Virginia conference in the convention at Louisville in 1845, when the organization of the Methodist Episcopal church, South, was effected. Retiring from the editorial management of the "Richmond Christian Advocate" in December, 1858, he resumed the work of the itinerant ministry, and is now (1874) presiding elder of the Petersburg district, Virginia conference. Besides occasional sermons, he has published "Letters to a Young Convert," "Life and Times of Jesse Lee" (Richmond, 1848), "Confirmation," and a small volume on "Perseverance."

**LEE, Luther**, an American clergyman, born in Schoharie, N. Y., Nov. 30, 1800. He united with the Methodist Episcopal church in 1821, and soon began to preach. In 1827 he joined the Genesee conference, and was stationed at Malone, N. Y., with a circuit embracing the entire county of Franklin, portions of Clinton and St. Lawrence, and appointments in Lower Canada. During the six years that were spent in the St. Lawrence region, Mr. Lee was engaged in several important doctrinal controversies that produced a very deep impression throughout the country. From 1833

to 1838 he was stationed at Lowville, Watertown, and Fulton. In 1838 he engaged in lecturing against slavery, and in 1841 assumed the editorial management of the "New England Christian Advocate," an anti-slavery journal published at Lowell, Mass. Soon after he issued a paper entitled "The Sword of Truth," and in the autumn of 1842, in connection with the Rev. Orange Scott, he began a weekly journal called "The True Wesleyan." When in 1843 the "Wesleyan Methodist Connection" was organized, he became pastor of a church in Syracuse, N. Y. At the first general conference of the Wesleyan church, he was chosen president; and he was editor of the "True Wesleyan," the organ of that body, published in New York, till 1852, after which he became successively pastor of churches in Syracuse and Fulton, N. Y. In 1856 he was elected president and professor of theology of Michigan Union college at Leoni; but the following year he resigned this office and served churches in Ohio. From 1864 to 1867 he was connected with Adrian college, Mich.; but at the latter date he withdrew from the Wesleyan church and returned to the Methodist Episcopal church, because slavery, the cause of the organization of the former, having been abolished, he saw no sufficient reason for its continuance. Since 1867 he has been a member of the Michigan conference, and now (1874) resides at Northville, Mich. He is the author of the following works: "Universalism Examined and Refuted" (1836); "The Immortality of the Soul" (1846); "Revival Manual" (1850); "Church Polity" (1850); "Slavery Examined in the Light of the Bible" (1855); and "Elements of Theology" (1856).

**LEE, Nathaniel**, an English dramatic poet, born at Hatfield, Hertfordshire, about 1657, killed in London in 1691. He was educated at Trinity college, Cambridge, and on leaving the university tried to push his fortunes at court; but not being successful, he began to write for the stage. From 1675 to 1681 he produced a new play every year. He became insane in 1684, and was confined in Bedlam for four years, when, having recovered his reason, he was liberated and resumed his former occupation. He is said to have lost his life in a nocturnal riot. He was an admirer and imitator of Dryden, whom he assisted in writing "Edipus" and the "Duke of Guise." He was the author of 11 tragedies, two of which, "Theodosius" and "Alexander the Great," were long popular on the stage.

**LEE, Mrs. R. Bowdich**, an English authoress, born about 1800, died in 1856. During a residence in Gold Coast colony, Africa, whither her first husband, Mr. T. E. Bowdich, had been sent on a mission of pacification to the Ashantees, she collected the materials for an interesting work, which appeared in 1825 under the title of "Stories of Strange Lands." Another work of the same character, entitled "The African Wanderers" (3d ed., 1854), has

been highly esteemed for the charm of its narrative and the exactness of its descriptions. Subsequently Mrs. Bowdich resided for many years in Paris, where she married her second husband, Mr. Lee. While there she enjoyed the friendship of Cuvier, of whom she wrote a memoir, and of other eminent authors and naturalists. Her remaining works are for the most part popular treatises on subjects of natural history. Among them are: "Elements of Natural History: Zoölogy;" "Taxidermy;" "Beauties, Uses, &c., of Trees, Plants, and Flowers;" and "Familiar Natural History."

**LEE, Robert Edward**, an American soldier, son of Col. Henry Lee, born at Stafford, Westmoreland co., Va., Jan. 19, 1807, died in Lexington, Va., Oct. 12, 1870. He entered West Point in 1825, and graduated second in his class in 1829. During his whole course he was never reprimanded or received a single mark of demerit. He was appointed lieutenant in the corps of engineers, and from 1829 to 1834 served as assistant engineer in the construction of Forts Monroe and Calhoun at Hampton roads; from 1834 to 1837 as assistant to the chief engineer at Washington; and in 1835 as assistant astronomer for establishing the boundary between Ohio and Michigan. From 1837 to 1841 he was superintending engineer of the improvements of the harbor of St. Louis and of the Missouri and upper Mississippi rivers, having also during 1840 and 1841 the general charge of the improvements in the lower Mississippi and Ohio rivers, below Louisville, Ky. He was made captain in 1838. After 1841, among other services, he superintended the construction and repair of the fortresses at the entrance of the harbor of New York, was assistant to the chief engineer at Washington, and member of the board of the Atlantic coast defences. When the Mexican war broke out he was assigned to duty as chief engineer of the army under Gen. Scott, and served with great distinction during the whole war. He was successively brevetted as major, lieutenant colonel, and colonel, for gallant and meritorious conduct at Cerro Gordo, Contreras and Churubusco, and at Chapultepec, where he was wounded. He afterward served as engineer in various departments, and was superintendent of the military academy at West Point from 1852 to 1855. In 1855 two new regiments of cavalry were formed. Of the second regiment Albert Sidney Johnston was made colonel, Lee lieutenant colonel, Hardee and Thomas majors, Van Dorn and Kirby Smith captains; and among the lieutenants were Hood, Fields, Fitzhugh Lee, Palmer, and Stoneman. Lee served with this regiment in Texas till 1857, when he received leave of absence, and returned to his home in Virginia. Through his marriage in 1832 with Mary, daughter of G. W. P. Custis, the grandson of Martha Custis and adopted son of Washington, he came in 1857 into possession of the estates of Arlington House on the Potomac

and the White House on the Pamunkey. In October, 1859, he was put in command of the forces to suppress the John Brown raid at Harper's Ferry. From February to December, 1860, he was in command of the department of Texas, and afterward received leave of absence. The Virginia convention having on April 17, 1861, passed an ordinance of secession, Lee on the 20th resigned his commission in a letter to Gen. Scott, in which he said: "Save in defence of my native state, I never desire again to draw my sword." To his sister he wrote on the same day: "The whole south is in a state of revolution, into which Virginia, after a long struggle, has been drawn; and though I recognize no necessity for this state of things, and would have forborne and pleaded to the end for redress of grievances, real or supposed, yet in my own person I had to meet the question whether I should take part against my native state. With all my devotion to the Union, and the feeling of loyalty and duty of an American citizen, I have not been able to make up my mind to raise my hand against my relatives, my children, my home. I have therefore resigned my commission in the army, and, save in defence of my native state, with the sincere hope that my poor services may never be needed, I hope I may never be called on to draw my sword." Although Virginia had seceded from the Union, the state had not as yet acceded to the confederacy; and Lee, who at once repaired to Richmond, was appointed major general of the forces of the state. In formally accepting this office, he said: "Trusting in Almighty God, an approving conscience, and the aid of my fellow citizens, I devote myself to the service of my native state, in whose behalf alone will I ever again draw my sword." Early in May Virginia joined the confederacy, the capital of which was removed to Richmond, and the southern congress passed a law appointing five generals, their commissions to rank in the order in which these officers had ranked in the United States army. The commissions as made out by the government were in the following order: S. Cooper, A. S. Johnston, R. E. Lee, J. E. Johnston, and P. T. Beauregard. J. E. Johnston remonstrated against this, claiming that he should have stood first, because he had been a brigadier general in the United States army, while none of the others had ranked higher than colonel. Apparently in consequence of this, Lee was not for a while appointed to any separate command in the field, A. S. Johnston being assigned to the west, and J. E. Johnston to the command in Virginia. Cooper, manifestly unfit to lead an army, remained at Richmond as adjutant general. For more than a year Lee filled no important place in the war. He was nominally merely superintendent of fortifications at Richmond and elsewhere, and seems also to have acted as military adviser to President Davis, and to have performed many of the duties per-

taining to the office of secretary of war. There are only occasional glimpses of him in the unsuccessful operations of the summer and autumn of 1861 in western Virginia. J. E. Johnston, who commanded the confederate forces in Virginia, was wounded at the battle of Seven Pines, May 31, 1862; A. S. Johnston had been killed at the battle of Shiloh, April 6; and the command of the confederate army of northern Virginia, having been held for three days by G. W. Smith, who was disabled by a paralytic stroke, was given to Lee, June 3. The confederate army at Richmond was soon augmented so as to be about equal in numbers to the Union army under McClellan, and on June 26 Lee commenced that series of operations known as the seven days' battles. The result was, that after the concluding battle at Malvern Hill, McClellan fell back to Harrison's Landing, and the siege of Richmond was virtually raised. (See ΣΗΘΚΛΗΘΜΗΝΥ.) Meanwhile the scattered Union forces in northern Virginia had been united under Gen. Pope, under the name of the army of Virginia; and to prevent these from aiding McClellan, Lee moved against them. The result of the operations was the second battle of Bull Run, Aug. 29 and 30, in which Pope was defeated. Lee thereupon entered upon the invasion of Maryland, which was brought to a close by the indecisive battle of Antietam, Sept. 16, 17. He then recrossed the Potomac into Virginia, and moved leisurely up the valley of the Shenandoah into that of the Rappahannock, finally taking up a strong position near Culpeper Court House. McClellan followed after considerable delay, and early in November the two armies were close together. McClellan seems to have been preparing to attack, when on Nov. 7 he was superseded by Burnside, who proposed a new plan of operations, by which the Union army was to move up the Rappahannock to Fredericksburg, cross the river there, and thence move directly toward Richmond. But when Burnside reached Falmouth, opposite Fredericksburg, he found that the bridges had been destroyed, and before pontoons could be brought up Lee had arrived and taken up a position on the opposite bank. Burnside at length crossed the Rappahannock, attacked Lee in his positions, Dec. 13, and was signally defeated. Hooker, Burnside's successor, instead of assailing Lee in front, turned his left flank, and gained his rear. Then ensued the battle of Chancellorsville, May 2-4, 1863, in which Hooker was worsted. After this battle Lee gathered all the available forces in the Carolinas and Virginia, and moving northward entered upon what proved an invasion of Pennsylvania. The Union army was now commanded by Meade, and the positions and strength of the two armies were such that a conflict soon became inevitable. By mere accident the encounter took place at Gettysburg, July 1-3, 1863. On the first day, when only parts of each army were present, the confed-

erates gained decided advantages. On the second day they appeared to have the best of it, although their advantages were apparent rather than real. On the third day they met a signal repulse, but were not routed; and Lee retreated in good order to the Potomac, intending to cross at once into Virginia. But the river had been swollen by rains so that it was now unfordable, and he intrenched himself upon the northern bank, where Meade after a circuitous march came upon him. On the 12th Meade was inclined to make an attack at once, but yielding to the opinion of a council of war postponed it until the next day. During the night Lee, who had succeeded in building a bridge, crossed the river, which had in the mean while become fordable in places, and was again safe in Virginia. He fell back to the Rapidan, followed closely and occasionally annoyed by Meade, and the two armies took up positions confronting each other. During the autumn and winter of 1863 there were no important operations in Virginia, and considerable portions of both armies were sent to the west. In October Lee undertook a movement apparently threatening Washington, and to counteract this Meade fell back as far as Centreville, a few miles from the twice-fought battle field of Bull Run, where he made a stand. Lee saw that his force was too small to carry out his design, and he returned to his old position, followed by Meade. Late in November Meade undertook an offensive operation, directed against Lee's right, which lay near a little stream called Mine run, almost within the borders of the region known as the Wilderness. This proved unsuccessful, and closed the active operations in Virginia during the winter of 1863 and the early spring of 1864. Gen. Grant, having been made commander-in-chief, as lieutenant general, decided to conduct in person the campaign in Virginia. Lee's army had lain in winter quarters on the south bank of the Rapidan, their lines, strongly intrenched, covering a space of about 20 m. When the spring campaign opened Lee had about 60,000 men; to oppose these Grant had about 140,000. Grant, while perceiving that the confederate army, rather than any geographical point, was the main object of the campaign, thought it advisable not to assail it in front, but to turn it by the right. The movement commenced on May 4. The Rapidan was crossed without opposition, and the army headed southward. The line of march lay through the western verge of the Wilderness. Grant seems to have assumed that Lee, finding his flank fairly turned by a greatly superior force, would fall back toward Richmond. But Lee resolved to attack the enemy while moving through this wooded region, in which the superiority of the federal force would be in a great measure neutralized by the character of the country. The attack was skillfully conceived and boldly executed. The result was the bloody but indecisive battle of the Wil-

derness, May 5, 6. (See WILDERNESS, BATTLE OF THE.) The armies were now in an apparent deadlock. Each threw up intrenchments in its front, which, though apparently slight, were sufficient to give a great advantage to the one receiving the attack, which neither commander was inclined to venture. To remove this deadlock Grant undertook to outflank Lee by marching upon Spottsylvania Court House. Lee perceived the movement, and, though mistaking Grant's objective point, reached that place first, where his forces intrenched themselves, and severe fighting ensued, culminating in a bloody but indecisive battle on May 12. On the 18th Grant moved southward from Spottsylvania, proposing to outflank Lee's right, thus compelling him to fall back toward Richmond, and the campaign took the form which it maintained as long as operations were carried on in the open field. The two commanders were so constituted that either was able to divine the intent of the other, and to take the best measures to thwart it. Grant, having a great preponderance of force, undertook to strike wherever there was any likelihood that the blow would be effective; and, whenever he found the enemy posted too strongly to be directly dislodged, to manœuvre him out of his position by turning it. Lee stood more directly upon the defensive, but was always upon the alert for an opportunity to strike an offensive blow. The general result was that each commander failed in every directly offensive effort; but Lee was gradually forced back toward Richmond until the close of May, when the confederates stood at bay on the Chickahominy, occupying essentially the ground which the Union army had held two years before, but strongly intrenched. If the confederate army could be defeated here, its ruin was certain, for the Chickahominy interposed an insuperable barrier to further retreat. Grant made an attack on June 3, which was signally repulsed. (See CHICKAHOMINY.) For ten days more the two armies confronted each other, both being strongly intrenched, and neither venturing any attack in force. At length, on June 12, Grant broke from his position, marched down the Chickahominy to the James, which he crossed, and took up a position near Petersburg, from which Richmond could be assailed on the south. Lee crossed the Chickahominy and the James, and undertook the defence of the confederate capital. Richmond itself was so strongly fortified that no direct attack upon it was feasible; but Petersburg, 22 m. S. of Richmond, commanded the railroads by which supplies must be mainly brought to the army at the capital, and the capture of Petersburg would involve the necessity of the abandonment of Richmond. The subsequent operations in Virginia thereupon resolved themselves mainly into the siege and defence of Petersburg. This lasted until April, 1865, when, Grant having fairly passed around the extreme right of the confederate defences, and having broken

through the lines, Lee abandoned Petersburg and Richmond, April 2. He had suffered heavy losses within the last few days; but he still had, if all could be concentrated, about 40,000 men, with which he hoped to be able to reach the mountainous region of the valley of Virginia, where the contest might be prolonged indefinitely; or perhaps to effect a junction with J. E. Johnston in North Carolina, and thence transfer the seat of war to the gulf states. But a series of disasters marked the retreat. The confederate army moved almost without provisions, and the supplies which Lee had ordered to await him at Amelia Court House were by some accident carried on to Richmond, which had been given up to the enemy. Grant in the mean while took up a vigorous pursuit. The confederates were obliged to scatter through the poor country in quest of food, a great portion of the men throwing away their arms. When on the 8th the small part which still retained a military organization had reached the neighborhood of Appomattox Court House, they found their way barred by a superior federal force, which had outstripped them. Grant had on the previous day sent a message to Lee to the effect that the result of the operations of the last week evinced that there was no hope of any further successful resistance on the part of the army of northern Virginia, and demanded its surrender, in order to avoid any further shedding of blood. Lee replied that he was far from being convinced that resistance was useless, but asked to know the terms upon which a surrender would be received. Grant named as the sole condition that "the men and officers surrendered shall be disqualified for taking up arms again against the government of the United States until properly discharged." Lee hesitated until the 9th, hoping for some favorable turn; but none occurring, and yielding to the opinion of his best officers, he on that day met Grant, and the terms of surrender were formally agreed upon, the substance being that the officers and the men under their command "shall not hereafter serve in the armies of the Confederate States or in any military capacity against the United States of America, or render aid to the enemies of the latter, until properly exchanged in such manner as shall be mutually approved by the respective authorities;" and that they "will not be disturbed by the United States authorities so long as they observe their parole and the laws in force where they reside." The list of paroled prisoners contained 27,805 names, but of these hardly a third had arms in their hands. Although Lee had in February been appointed general-in-chief, with the command of all the forces of the confederacy, the capitulation only applied to the army in Virginia; but the surrender of this army virtually brought the war to a close. After the war Lee retired into private life, refusing even to attend public gatherings of any description.

His own fortune had been almost entirely swept away during the war, and in October, 1865, he accepted the presidency of Washington college at Lexington, Va., where in a short time the students numbered nearly 500. In March, 1866, he appeared as a witness before the reconstruction committee of congress. His testimony was to the effect that, as far as he knew, the people of the south did not contemplate any resistance or opposition to the government of the United States, and were in favor of the reconstruction policy of President Johnson; that they expected to pay their portion of the national debt, and would probably, if able, be willing also to pay their share of the confederate debt; and that the people of Virginia looked upon the action of the state in withdrawing itself from the government of the United States as carrying the individuals of the state along with it; that the state, not individuals, was responsible, and that the state was merely using a lawful reserved right. On the evening of Sept. 28, 1870, while apparently in his usual health, he was struck with paralysis, and never fully recovered, although he lived a fortnight longer. His wife, Mary Custis, great-granddaughter of Martha Custis (afterward the wife of Washington), born at Arlington House in 1806, died at Lexington, Nov. 6, 1873.—Gen. Lee had three sons and four daughters. One of the daughters died during the war. His sons all served in the confederate army. G. W. CUSTIS LEE, born about 1833, graduated at West Point in 1854, resigned his commission as lieutenant of engineers in May, 1861, entered the confederate service, became aide-de-camp to President Davis, and subsequently a general of infantry, and succeeded his father as president of Washington college, now called Washington and Lee university. The second son, W. H. F. LEE, became a general of cavalry; and the third, ROBERT E. LEE, served as a member of the cavalry staff. A nephew, FITZHUGH LEE, born about 1835, graduated at West Point in 1856, served as lieutenant of cavalry, mainly in Texas, till 1861, when he resigned his commission, entered the confederate service, and rose to be a general of cavalry.—See "Life of Robert E. Lee," by John Esten Cooke (New York, 1872); *Le général Lee*, by Edward Lee Childé (Paris, 1874); and "Personal Reminiscences of Gen. Robert E. Lee," by Rev. J. W. Jones (New York, 1874).

**LEE, Samuel**, an English scholar, born at Longnor, May 14, 1783, died at Barley, Dec. 16, 1852. He was educated at a charity school, and at the age of 12 was apprenticed to a carpenter. While laboring at his craft he mastered the Latin, Greek, Hebrew, Chaldaic, and Syriac languages. He subsequently acquired a knowledge of Arabic, Persian, French, German, and Italian, with the assistance of Archdeacon Corbett, who in 1810 procured his appointment to the mastership of a foundation school at Shrewsbury. He entered Queen's college, Cambridge, in 1813, graduated in due course,

took orders, and in 1819 became professor of Arabic at his university. In 1831 he was elected regius professor of Hebrew in the university of Cambridge, which in 1833 conferred on him the degree of D. D., an honor received by him more than ten years before from the German university of Halle. His chief publications were: "Hebrew Grammar" (1830); "The Travels of Ibn Batuta," translated from the Arabic (1833); a translation of Job (1837); a "Hebrew, Chaldaic, and English Lexicon" (1840); and "An Inquiry into the Nature, Progress, and End of Prophecy" (1849).

**LEE, I. Sophia**, an English authoress, born in London in May, 1750, died at Clifton, near Bristol, March 13, 1824. She was the daughter of an actor, who was originally a lawyer, and made her first appearance before the public in 1780 as the author of a comedy entitled "The Chapter of Accidents," which was brought out at the Haymarket theatre with great success. In the succeeding year she removed with her sisters to Bath, where she devoted the profits of her play to the establishment of a young ladies' seminary, over which she and her sister Harriet presided for many years. In 1785 she published "The Recess," a historical tale of a rather sombre character, which attained considerable popularity, and which was followed by "Almeyda," a tragedy, performed with moderate success; "The Life of a Lover," a novel in 6 vols.; and an unsuccessful comedy, "The Assigination." She also furnished "The Young Lady's Tale" and "The Clergyman's Tale" to the series of "Canterbury Tales," written by her sister Harriet and herself, which are considered her best productions. She gave up her seminary in 1803, and passed the remainder of her life in retirement. Her conversational powers were remarkable.

**II. Harriet**, sister of the preceding, born in London in 1756, died at Clifton, Aug. 1, 1851. Her first appearance as an authoress took place in 1786, when she published "The Errors of Innocence," a novel in 5 vols., succeeded by several others now forgotten. In 1797 appeared the first volume of the "Canterbury Tales," followed at intervals of a few years by four others under the same title, the contents of which were for the most part of her composition. They enjoyed a great popularity in the early part of the century; and a new edition was published in New York in 1856-'7 (3 vols. 12mo). One of the most remarkable is "The German's Tale: Kruitznor," from which Lord Byron borrowed not merely the plot and the machinery down to the most trivial incidents, but in some instances the language, of his "Werner." She also produced two dramas, "The New Peerage" and "The Three Strangers," the latter of which failed at Covent Garden in 1835.

**LEE, William**, an Irish clergyman, born in 1815. He was educated at Trinity college, Dublin, of which he was elected fellow in 1839; appointed professor of ecclesiastical his-

tory in 1857, and Archbishop King lecturer in divinity in 1863; and is now (1874) arch-deacon of Dublin. He has published a number of works, among which are the Donellan lectures for 1852, "Inspiration of Holy Scripture, its Nature and Proof" (1852; 4th ed., 1865); "Three Introductory Lectures on Church History" (1858); "Progress of Astronomy" (1860); "Translations in English Verse of Ovid, Horace," &c. (1860); and "Recent Forms of Unbelief" (1864).

**LEECH**, a red-blooded, footless, smooth-bodied, abranchiate annelid of the family *hirudinei*, and genus *sanguisuga* (Sav.) or *hirudo* (Linn.). The body is soft, retractile, composed of numerous segments, with a sucker at the posterior extremity, serving both to attach and to move the animal. The muscular system is well developed, closely embracing the viscera; the sucker has both circular and radiating fibres. The nervous system consists of a large anterior cerebral ganglion, and a chain of ventral ganglia connected by two contiguous cords; the ganglia are fewer than the segments, the first and last being the largest, the former sending filaments to the lips, and the latter to the sucker; there is also a splanchnic system of small anterior ganglia which send filaments to the parts about the mouth and to the intestinal canal. The sense of touch is particularly developed at the anterior extremity. There are ten eye specks symmetrically arranged upon the neck, each a transparent cylindrical body bulging out under the skin like a cornea, enveloped in a layer of black pigment, receiving a filament from the cephalic ganglion, according to Wagner having a lens and a vitreous body (though this is denied by others), and constituting light-perceiving if not light-refracting organs. The flattened body tapers toward each end, the mouth being at the anterior extremity and provided with a sucking apparatus; at the base of the pharynx are three fleshy swellings, the projecting border of which is edged with bicuspid teeth, causing wounds shaped like a three-rayed star. The intestinal canal is straight, but deeply constricted in many places, each such portion sending off short cæca on each side; the anal opening is on the back directly above the posterior sucker. There are salivary glands around the commencement of the intestine, and a glandular hepatic organ envelops a great part of this canal. The blood contains colorless granulated globules; there is a central contractile vessel, and a circulation and oscillation in longitudinal and lateral vessels. Respiration is effected by means of 17 pairs of internal branchiæ or aquiferous canals without ciliated epithelium, opening upon the ventral surface of the body, and surrounded by a network of blood vessels. Reproduction is effected by sexual organs, and the two sexes are united in the same individual, they being true hermaphrodites; the eggs, from 6 to 15, are contained in a cocoon, surrounded by a thick spongy substance said to be ejected from the mouth, de-

posited near the edge of the water, and hatched by the heat of the sun; the young leave the egg without undergoing any metamorphosis. The leech inhabits the water principally, and swims with a vertical undulating motion; out of the water it moves by the disks or suckers, fastening itself first by one and then by the other, alternately stretching and contracting the body; it is torpid in winter, hiding in the mud; it can live a long time in sphagnous moss or in moist earth, and can thus be transported for long distances. Leeches live at the expense of other animals, whose blood they suck; they attach themselves to fishes, batrachians, invertebrates, and to mammals and men that venture into the fresh water inhabited by them. Many species are used for medical purposes, of which the most common are the gray and the green leeches of Europe (*S. medicinalis* and *officinalis*, Sav.); generally considered varieties of one species; both have six longitudinal ferru-

Leech (*Sanguisuga medicinalis*).

1. Leech. 2. Anterior extremity magnified. 3. Jaw detached, magnified. 4. Part of belly magnified.

ginous stripes on the back, the four lateral ones interrupted by black spots; the back varies from blackish to grayish green; the under parts in the first variety are greenish with black spots and edgings, in the second yellowish green without spots; the length varies from 2 to 4 in. They formerly inhabited in great numbers the marshes and streams of most countries of Europe; but of late years the demand for medical purposes has exhausted most of the localities in central and southern Europe; the Swedish leeches are now generally considered the best. There are many American species, of which the *hirudo decora* (Sav.) is extensively used in the interior of the middle states; the color is deep greenish above with three rows of square spots, the central brownish orange, and the lateral black; the under parts are spotted with black; it varies in length from 3 to 5 in.; it is especially abundant in Pennsylvania, and several hundred thousand are employed annu-

ally.—Leeches afford the least painful and in many cases the only practicable means of local depletion, and are precious instruments in the hands of the physician. They will generally bite eagerly, and will draw from a quarter of an ounce to an ounce of blood, according to the vigor and size of the animal and the vascularity of the part to which it is applied; when full they drop off, though they will sometimes continue to draw after their tails are cut off; the application of a little salt will make them drop at any time; bathing the part with warm water will increase the quantity of blood lost. When gorged with blood, digestion may not be completed for many months; hence it is customary to strip them by drawing the body between the fingers from the tail to the head, the little that remains serving to keep them in good condition for a long time, if they be kept in clean and frequently changed water. Full leeches are liable to disease and to induce it in others, and should be kept by themselves, not to be used until they have regained their activity; as they often change the slimy coat on their skin, they require moss and roots to draw themselves through in order to keep healthy. In the rare cases in which leech bites bleed too long, the flow may be arrested by pressure, alum solution, caustic, or a superficial suture. The application of leeches requires some skill and attention, and is often usefully placed in the hands of special practitioners, both male and female.—The horse

leech (*hæmopsis*, Sav.) is a larger species, differing principally by the oval and slightly toothed jaws; it will not attack man, and it is doubtful if it attaches itself to horses and other animals; it devours other worms, swallowing them whole.—The leech family is a large one, and can be studied only in special treatises, of which a long list is given in the chapter on annelids in Siebold's "Comparative Anatomy."

**LEECH, John**, an English artist, born in London about 1817, died Oct. 29, 1864. He was educated at the Charterhouse, and soon after the establishment of "Punch" brought himself into notice by his humorous illustrations for that serial. Several thousand sketches, illustrating the politics, fashions, and follies of the day, testify to the industry of his pencil and the fertility of his invention; and the greater part of these, though hastily thrown off, have artistic merit as well as humor, the drawing and expression being in most cases excel-

lent. The social extravagances of England never found a more apt or kindly delineator; but in sporting scenes, particularly those in which the horse is introduced, he was pre-eminent. He was connected with "Punch" almost from its establishment, and from time to time he published collections of his pictorial contributions to its columns, entitled "Pictures of Life and Character, from the Portfolio of Mr. Punch," each containing 500 woodcuts. He illustrated several of Albert Smith's novels, the "Comic History of England," &c., and published under his own name, "The Rising Generation, a Series of Twelve Drawings on Stone" (1848), and other works.

**LEEDS**, a N. E. county of Ontario, Canada, on the N. bank of the river St. Lawrence, near Lake Ontario; area, 895 sq. m.; pop. in 1871, 35,302. It has a rough, hilly surface, diversified by a number of small lakes in which rise Cataragui and Rideau rivers. The soil is generally fertile. Wheat, oats, potatoes, Indian corn, peas, buckwheat, and rye are the principal productions. It is traversed by the Grand Trunk and the Brockville and Ottawa railroad. Capital, Brockville.

**LEEDS**, a municipal and parliamentary borough of the West riding of Yorkshire, England, situated on both sides, but chiefly on the left, of the navigable river Aire, 22 m. W. S. W. of York and 206 m. by railway N. N. W. of London; pop. in 1851, 172,270; in 1871,

Town Hall, Leeds.

259,212. Its site was probably at one time a Roman station; its mediæval name (Loidis) is Saxon. As a manufacturing town it dates back only to the 16th century. The principal and best part of Leeds stands on the slope of a hill N. of the Aire. Most of the town is irregularly built, with narrow and crooked streets; but in the centre and west the streets are wide and handsome, being lined with modern build-

ings. Two stone bridges and four of iron cross the river, on the S. side of which are the extensive suburbs of Holbeck and Hunslet. The streets are well paved and the sidewalks flagged and lighted with gas, and an abundant supply of water is conveyed from the Harewood hills, 5 or 6 m. distant. There are many handsome public buildings, especially the town hall, completed in 1858. Improvements are in steady progress. The largest buildings are the cloth halls, in which the cloth markets are held, the commercial buildings, three market houses, the corn exchange, the court house, with a bronze statue of Sir Robert Peel in front of it, the town hall, the stock exchange, the jail, the cavalry barracks, &c., and the places of public amusement. Many of the churches are large and elegant buildings. In 1871 there were 225 places of worship, of which 73 belonged to the church of England. The Leeds free grammar school, founded in 1552, is endowed with an income of about £2,000 per annum. The industrial school at Burmantofts, opened in 1848, is a large and very complete establishment, the buildings forming a capacious and ornamental Elizabethan pile, and the grounds covering six acres. Leeds possesses an excellent library founded by Dr. Priestley in 1768; the library and museum of the literary and philosophical society; a mechanics' institution, a school of design, a medical school, &c. The charitable institutions are: the Leeds infirmary with 150 beds, the house of recovery for fever patients, a dispensary, an eye and ear infirmary, a lying-in hospital, and several almshouses for the poor and aged. Leeds is particularly distinguished for its musical festivals. In woollen manufactures it now surpasses all other English cities, and more leather is tanned here than at any other place in the British empire. For a long time only the coarser kinds of woollens were manufactured, but cloths are now produced which for fineness and colors cannot be surpassed. About 12,000 persons are employed in the woollen manufacture in more than 100 factories; about an equal number of persons are employed in flax spinning and weaving. Nearly a quarter of the whole population are employed in the various manufactories. Notwithstanding this increased prosperity, there is still much pauperism. No other town in England is so admirably situated for trade, being placed in the heart of the inland navigation of the country. It communicates with the sea eastward by means of the Aire and Calder navigation to the Humber, and westward by the Leeds and Liverpool canal to the Mersey. The warehouses of the Aire and Calder company are of great dimensions, and there are convenient docks. Leeds is also the centre of a network of railways converging to it from all parts of the country, and placing it in connection with every important town of the kingdom. In the surrounding district there are more than 100 collieries. About 2 m. from Leeds are the ruins of Kirkstall abbey.

**LEEK** (*allium porrum*), a plant of the same genus with the onion, a native of the shores of the Mediterranean, and naturalized in other parts of Europe. It has been long in cultivation, and was probably known to the ancient Egyptians. Like the onion it is a biennial, but differs from that in having flat leaves, and in not forming a large flattened bulb; in the leek the lower part of the plant, which may be regarded as an elongated nearly cylindrical bulb, is the edible portion, the size of which is increased in cultivation by drawing the earth up around it. The seeds are sown in spring in very rich ground, and the plant is given the same cultivation as the onion, and is ready for use in the fall. Leeks cannot, like the onion, be kept in the dry state, but if required for use during winter must be preserved in trenches, like celery. In mild climates they may pass the winter in the open ground without protection. The second year the plant throws up a stem 2 to 3 ft. high, which bears an umbel of

Leek.

white flowers marked with purple. Though the odor and flavor of the leek are decidedly alliaceous, they are very distinct from those of the onion; and it is much used, especially by Europeans, as an ingredient in soups and stews. The dish "cock-a-leekie," known at least by name to the readers of Scott, is a favorite with the Scotch; it consists of an old fowl stewed to tenderness with an abundance of leeks.—Several native and one introduced species of *allium* are known to farmers as wild leek and wild garlic. They are objectionable in pastures, as they impart to the milk and butter from the cows which feed upon them a most disagreeable odor. One species which occurs in wheat fields, bears small bulblets instead of seeds; these are not much larger than a grain of wheat, and when mixed with the grain injure the flour. Good cultivation and a proper rotation of crops are the only remedy.

**LEELANAW**, a N. W. county of the S. peninsula of Michigan; area, about 1,000 sq. m.; pop. in 1870, 4,576. It occupies a peninsula formed by Grand Traverse bay and Lake Michigan. The chief productions in 1870 were 24,112 bushels of wheat, 19,989 of Indian corn, 15,322 of oats, 84,343 of potatoes, 53,971 lbs. of butter, 37,056 of maple sugar, and 1,607 tons of hay. Value of live stock, \$123,022. There were 5 flour mills and 7 saw mills. Capital, Northport.

**LEEMANS, Conradus**, a Dutch archæologist, born at Zalt Boemel, Gelderland, April 28, 1809. He studied theology and archæology at the university of Leyden, and in 1839 became director of the museum of that city. In 1859 he was commissioned by government to establish at Leyden a national ethnographic museum, of which he has the direction, and to which was added Siebold's Japanese collection. He has published a critical edition of the *Hieroglyphica* of Horapollo (Leyden, 1835), *Description raisonnée des monuments égyptiens du musée à Leyde* (1840), *Papyri Græci Musei Lugduno-Batavi* (vol. 1., 1843), and several other works upon Egyptian, Greek, and Roman antiquities. He has also published a description of the Asiatic and American antiquities in the museum of Leyden (1842). His most important work is *Aegyptische monumenten van het museum van oudheden te Leyden* (23 parts, 1835-'65).

**LEEB**, a seaport town of Prussia, in the province of Hanover, on the Leda, about 1 m. above its entrance into the Ems, and 16 m. S. of Aurich; pop. in 1871, 8,932. It has three churches (Reformed, Lutheran, and Catholic), a Mennonite meeting house, a synagogue, a gymnasium, and an industrial school. It has considerable navigation and ship building, and an increasing number of manufactories.

**LEES, Frederic Richard**, an English temperance orator, born at Meanwood Hall, near Leeds, Yorkshire, March 15, 1815. When 19 years old he connected himself with the temperance cause, and in the following year with the total abstinence movement. From 1837 to 1840 he held various discussions with the Owenites, and published in 1838-'9 "The Metaphysics of Owenism Dissected." From 1841 to 1844 he gained several prizes for essays on temperance; and in 1856 he gained £100, offered by the United Kingdom alliance for an argument for the legislative prohibition of the liquor traffic. In 1843 he held a discussion with Mr. Jefferson, a surgeon, in which he explained the bearing of the discoveries of Liebig on the temperance question. In 1845 he started "The Truth Seeker in Literature, Philosophy, and Religion," a magazine devoted to free and catholic inquiry, and to transcendental and spiritual philosophy, which continued through six volumes. In 1848 he held discussions with several of the physicians of Newcastle, and was presented with a public testimonial. In 1853 he visited the world's temperance con-

vention in New York as the representative of the British temperance association of the north of England. In 1860 he received a public testimonial of 1,000 guineas from the friends of temperance in Great Britain. He is the author of a "History of Alcohol" (1843), and of a "Treatise on Logic, or the Method, Means, and Matter of Argument."

**LEESER, Isaac**, an American rabbi, born in Neukirch, Westphalia, Dec. 12, 1806, died in Philadelphia, Feb. 1, 1868. In 1825 he emigrated to the United States, where for a short time he devoted himself to commerce. In 1829 he became rabbi of the principal synagogue of Philadelphia, and acquired reputation by his contributions to literature, referring principally to Jewish history and theology. For several years he edited "The Jewish Advocate" (or "Occident"), a journal devoted to the interests of his creed. Among his works are: "The Jews and the Mosaic Law" (1833); "Discourses, Argumentative and Devotional" (1836-'40); "Portuguese Form of Prayers" (1837); a "Descriptive Geography of Palestine;" and a translation of the Hebrew "Holy Scriptures" according to Jewish authorities (1856). He also published an edition of the Hebrew Bible (1866).

**LEEUWARDEN**, a town of Holland, capital of the province of Friesland, situated in a fertile plain on the Ee, 10 m. from the sea, and 70 m. N. E. of Amsterdam; pop. in 1872, 26,264. It is well built, intersected by numerous canals, and connected by others with Harlingen, Groningen, and Delfzyl. The principal buildings are the ancient palace of the princes of Orange, the government house, and the old Landhuis. It has a society for Frisian history, antiquities, and language, a natural history society, a gymnasium, a musical school, a school of design, 12 churches, and various manufactories.

**LEEUWENHOEK, or Leeuwenhoek, Antonius van**, a Dutch naturalist, born in Delft, Oct. 24, 1632, died there, Aug. 26, 1723. He had no learned education, and in early life was engaged in mercantile pursuits. He cultivated science during his spare moments, and attained the reputation of making the best microscopes in Europe. By his applications of the microscope, and by the researches in physiology to which they conducted him, he attracted the attention of the royal society of London; and the greater part of his writings, containing accounts of his discoveries, were published in the English "Philosophical Transactions." He was among the first observers to employ the microscope in anatomical and physiological investigations, of which he made a great number by means of simple microscopes of his own construction. These instruments consisted of a single biconvex lens, fixed in a perforated metallic plate, to which was attached a movable needle destined to carry and fix in a proper position the object to be examined. Though of such simple construction, they were often of very high magnifying power, owing to the

strong convexity of the surfaces of the lens. Leeuwenhoek was particularly distinguished for his discovery of the red globules of the blood in 1673, that of the infusorial animalcules in 1675, and that of the spermatozoa in 1677. Malpighi had seen and mentioned as early as 1661 what were undoubtedly the blood globules; but he did not perceive their true nature nor give an exact description of them. Leeuwenhoek discovered their existence and their most important characters in human blood as well as in that of birds, reptiles, and fishes. The spermatozoa were first seen by a student of medicine named Ham. He immediately communicated the fact to Leeuwenhoek, who at once verified the reality of the discovery in the human spermatic fluid, and extended it to that of the dog, the rabbit, the ram, the cock, and various other animals. The infusorial animalcules he discovered in the rain water which ran from the roof of his house. Leeuwenhoek's life was passed in scientific research and in manufacturing optical instruments in his native city. He was visited by Queen Mary, and was invited to visit the czar Peter when that sovereign was in Delft. His writings were collected and published in Dutch separately at Delft and Leyden. They also appeared in Latin (Delft, 1695), and a selection of his works, containing his microscopical discoveries in many departments of nature, translated into English by Samuel Hoole, was published in London, 1798-1801.

**LEEWARD ISLANDS**, a name applied by European navigators and geographers to such of the Lesser Antilles as lie between lat. 15° and 19° N., comprising the British islands Dominica, Montserrat, Nevis, Antigua, Barbuda, St. Christopher, Anguilla, and the Virgin group, the French islands Guadeloupe and Marie Galante, with the Danish and Swedish and most of the Dutch possessions in these waters. The English Leeward islands, which in 1872 received a common administration under a governor-in-chief, have an area of 733 sq. m.; pop. in 1871, 120,491. The islands lying south of lat. 15° N. along the northern coast of South America are called Windward islands. American geographers generally reverse these appellations.

**LEFEBVRE, Charlemagne Théophile**, a French traveller, born in Nantes in 1811, died in Paris in 1859. He was an officer in the navy, and explored several regions, especially Abyssinia. His companions, the naturalists Dillon and Petit, died in that country, where upon his last journey he contracted a fever which ultimately proved fatal. The *Voyage en Abyssinie, exécuté pendant les années 1839-'43* (6 vols., Paris), was published by the government at the request of the academy. For this work Lefebvre wrote the first two volumes, and a portion of the third.

**LEFEBVRE, François Joseph**, duke of Dantzic, a French marshal, born at Ruffach, Alsace, Oct. 25, 1755, died in Paris, Sept. 14, 1820. He was the son of a miller who had served

in the hussars, enlisted in 1773 as a private soldier, was a sergeant at the commencement of the revolution, was rapidly promoted to the rank of general of division (Jan. 10, 1794), and distinguished himself on many occasions by his bravery, especially at the battle of Fleurus (1794). On June 4, 1796, he led the van of Kléber's army in the attack on the Austrian position at Altenkirchen, and on March 25, 1799, at the battle of Stockach, maintained his ground for several hours with 8,000 men against a force of 36,000 Austrians. Having aided Bonaparte to overturn the directory, he was appointed to the command of the military in and around Paris, became a senator, and in 1804 was made a marshal of France. In 1806 he accompanied Napoleon against Prussia, and in the battle of Jena commanded the foot guards. He was next placed in command of the forces sent to reduce Dantzic, which surrendered May 24, 1807, after a siege of 51 days; and on the 28th he received the title of duke of Dantzic. He subsequently served in the peninsula, was present in 1809 at the battles of Eckmühl and Wagram, and participated in the Russian expedition as commander of the imperial brigade. On the downfall of the emperor, Louis XVIII. created him chevalier of St. Louis and a peer of France; but having retained his seat in the imperial senate during the hundred days, he was excluded on the second restoration from the chamber of peers. His rank was restored to him in 1819.

**LEFEBVRE-DESNOUETTES, Charles**, count, a French general, born in Paris, Sept. 14, 1773, lost at sea near Kinsale, Ireland, April 22, 1822. He ran away from college to enter the army, served under Dumouriez in 1792, was an aide-de-camp to Bonaparte at Marengo, became colonel in 1804, and distinguished himself at Austerlitz. He became brigadier general in 1806 and general of division in 1808, began the siege of Saragossa, but soon afterward joined the corps of Bessières, and was taken prisoner and sent to England. While on parole, he escaped to France, and Napoleon gave him command of the chasseurs of the guard in the campaign of 1809 against Austria. He participated in the invasion of Russia, contributed largely to the victory of Bautzen (May 21, 1813), was beaten at Altenburg, Sept. 28, by Platoff and Thielmann, and on Oct. 30 gained a brilliant advantage over a corps of Russian cavalry. He led the cavalry at Brienne, Jan. 29, 1814, and received several wounds. He remained at the head of the chasseurs after Napoleon's abdication, but espoused his cause on his return from Elba, and was obliged to fly in disguise. He was named a peer by Napoleon on his arrival at Paris, and fought with great intrepidity at Fleurus and Waterloo. After the second restoration he was condemned to death and fled to the United States, where he attempted to found a colony of French refugees at the south. On his way to Belgium, hoping to reënter France, he perished by shipwreck.

**LEFÈVRE** (called also **FAVRE**, **FAIVRE**, and **FABER**), **Pierre**, the first associate in Paris of Ignatius Loyola, born at Villaret, Upper Savoy, April 13 or 14, 1506, died in Rome, Aug. 1, 1546. His parents were peasants, but he received a classical education, graduated at the university of Paris in 1530, and began to lecture on philosophy at the collège Ste. Barbe, where Ignatius Loyola was his pupil. He was ordained priest in 1534, and in 1537 went to Rome and obtained for Loyola and his companions the pope's consent to their going to Palestine. In November he was appointed professor of theology in the Sapienza college at Rome, and was chosen in 1538 to visit and reform the diocese of Parma. He was the first Jesuit to enter Germany, where he labored with great success at Worms, Spire, Nuremberg, Mentz, and Cologne, disputing publicly with the reformers when necessary, but chiefly confining himself to persuade nobles, clergy, and people to lead edifying lives. He visited the Netherlands twice; went to Portugal at the request of King John III. in 1544, and regulated the college founded at Coimbra for the education of young Jesuits; founded in Spain the Jesuit colleges of Valladolid, Alcalá, Madrid, Valencia, and Gandia; and visited and reformed several dioceses by order of the bishops. He was recalled to Rome in February, 1546, set out on foot, and died of a violent fever soon after his arrival. He had stopped for a few days at Villaret while on his way to Spain in 1543, and did much to instruct and elevate the people who flocked from every direction to see him. Even then they called him "blessed" and "saint." After his death they canonized him spontaneously. A chapel was built in his memory near his father's house, with the sanction of the bishop. This *cultus* was approved by St. Francis of Sales, who visited and embellished the chapel. St. Francis Xavier placed his name in the litany of the saints; and this veneration was shared by St. Ignatius and St. Francis Borgia. In 1872, in response to a petition of the bishop and clergy of Annecy, the congregation of rites approved (Aug. 31) the honor paid in Savoy to the Blessed Pierre Lefèvre, and this was confirmed by Pius IX., Sept. 5. His feast is celebrated on Aug. 1.—See Father Giuseppe Boero, "Life of the Blessed Peter Favre," containing a "memoir" or autobiography of the saint (translated from the Italian, London, 1873).

**LE FLÔ**, **Adolphe Emmanuel Charles**, a French soldier, born at Lesneven, Finistère, Nov. 2, 1804. He served in Algeria, and in 1848 attained the rank of brevet brigadier general, and was sent as envoy to St. Petersburg. Returning to France in March, 1849, he became a member of the constituent assembly, and subsequently of the legislative assembly. He evinced decided hostility to the schemes of Louis Napoleon for the restoration of the empire, and was among the first members arrested on Dec. 2, 1851. He lived in exile till 1859,

when he returned to France. In 1870-'71 he was minister of war in the government of national defence, and afterward in that of Thiers. He was also returned for Brest to the national assembly at Bordeaux, in which, however, he took no prominent part. In the summer of 1871 he was sent as ambassador to Russia.

**LEFLORE**, a N. W. county of Mississippi, formed since the census of 1870; area, about 700 sq. m. The Tallahatchie and Yallahusha rivers unite in the N. part to form the Yazoo, which bounds the county partly on the S. E. The surface is level and the soil very fertile. Capital, McNutt.

**LEFORT**, or **Le Fort**, **François**, a Russian general, of Swiss origin, born in Geneva in 1656, died in Moscow, March 12, 1699. He early became a cadet of the Swiss guards in the French service, entered the army of Holland in 1674, and soon after went to Russia, where he received a captain's commission from the czar Alexis, and fought against the Turks and Tartars. After the death of Feodor III. in 1682, and the joint accession of the half brothers Ivan and Peter, he espoused the interests of the latter, took an active part in the movement which raised him to supreme authority in 1689, by removing his sister Sophia from the court, and at once became his chief minister. Peter intrusted to him the reorganization of the army after the European model, and appointed him general admiral, in which capacity he vigorously seconded the czar's efforts for the creation of a navy. In celebration of the first success of the new army and navy in the taking of Azov in 1696, a magnificent triumphal entry was prepared for the troops, in which Lefort, borne on a chariot in the form of a marine shell, held the place of honor, the czar walking behind him. He aided in quelling the insurrection of the strelitzes, and died in consequence of wounds received on that occasion. Lefort also exercised great influence in ameliorating the laws of Russia, secured religious toleration for foreigners, and was either the originator or promoter of many of the grand improvements which distinguished the reign of Peter the Great.

**LEFUEL**, **Hector Martin**, a French architect, born in Versailles, Nov. 14, 1810. He studied in Paris and Rome, and in 1848 exhibited his famous designs for a monument in a Florentine palace. He was appointed architect of the palace of Meudon, and subsequently of Fontainebleau. Upon the death of Visconti in December, 1853, he modified the plans of the latter for the new Louvre, which he completed in 1857. He has executed many public edifices, among which is the palace of fine arts for the exposition of 1855. He was admitted to the institute in 1855, and is professor in the school of fine arts, and chief architect of the national palaces. He is regarded rather as an eclectic in architecture than as an original genius.

**LEGACY** (Lat. *legatum*, from *legare*, to bequeath), a gift of any personal property by

will. In Rome the general law determined uniformly who should succeed to the political, social, and personal rights of one who had died; but a member of the *populus* might get a special law passed by the *comitia curiata* authorizing an alteration of the usual rules for the distribution of property. A testament was, therefore, nothing else than a private law, and hence *legare*, from *lex*, came to be used as the appropriate word for making testamentary dispositions. The peculiar feature of the testament was the institution of an heir, that is, of a person who was to succeed to the *persona* of the testator. A legacy was an injunction to this heir to give or pay over to a third person a part of the inheritance. The word was never applied, as in the English law, to a direct bequest; and if there was no heir, the legacy necessarily failed. In our law, a legacy is a gift or bequest of goods or chattels by testament. As no testamentary disposition of such property can be administered without the interposition of a representative of the deceased, the court, if no executor was appointed by the will, or if he who was appointed declines to accept the trust, will itself assume the nomination of an administrator. In him all the personal property is vested, and it is his office to estimate the assets and pay the debts of the deceased, and to divide the surplus, if any, according to his will, or according to the general statutes of distribution. A legatee acquires indeed, under the testament itself, an inchoate right to the legacy; but this is perfected only by the assent of the executor, or other representative of the testator.—Legacies are said in law to be general, specific, or demonstrative. The two former of these must be nicely distinguished from each other, because, as we shall see further on, the one class is subject to abatement, and the other to ademption. A legacy is general when it does not bequeath a particular thing or part of the testator's personal estate by distinguishing it from all others of the same kind; thus, the gift of a horse or of a diamond ring, without indicating any particular horse or ring, is a general legacy. So bequests of money for a ring or to purchase government securities, or of an annuity to be purchased out of or charged to the personal estate, or of so much money to be paid in cash, have been construed to be general legacies. A legacy is specific when it refers by particular description to a certain chattel, and shows an intention that the legatee shall have the very thing, and not merely an equivalent value. For example, the gift of "my East India bonds," or "a sum of money now in the hands of A," or of "the money due on B's note," is a specific legacy. Demonstrative legacies partake in some respects of the qualities of both those just mentioned, and may be defined to be those which in their nature are general, but are to be satisfied, according to the will, out of a particular fund; thus, "1,000 dollars out of my bank stock." This kind of

legacy possesses the better qualities of both the others. It is so far general that it is not adeemed by mere change in the fund out of which it is to be satisfied, and so far specific that it does not abate with general legacies for the payment of debts. A specific legacy may be adeemed; that is, if the subject of it be not in existence at the time of the testator's death, then the bequest entirely fails. Thus, if a debt specifically bequeathed be received or discharged by the testator, it will be adeemed, for there remains nothing for the will to operate upon. But a specific gift is not adeemed by the testator's pledge of the subject of it, and the legatee will be entitled to have it redeemed by the executor, and, if the latter fails to do so, to receive compensation out of the general assets. A demonstrative legacy is not adeemed by a failure of the particular fund upon which it was charged. The value is the principal thing; the particular fund designated is only accessory and of secondary importance, and if it no longer exist, the bequest must be satisfied out of the general assets.—A legacy lapses if the legatee die before the testator, or, if after his death, yet before the contingency happened upon which the legacy was to vest. The general and well established rule of the common law is, that unless the legatee survive the testator, the legacy is extinguished. Statutes in many of our states have changed this rule, and extend the benefit of legacies to the lineal descendants or other heirs of legatees. The consequences of lapse may always be avoided by special provisions in the will. As to lapse by death of the legatee after the testator, it may be laid down as a general rule, that when a legacy is given without specifying any time for its payment, it is due on the death of the testator, although not payable until after one year. This year being intended only for the convenience and safety of the executor, it is not permitted to prevent the vesting of the legacy; and if the legatee die within the year, the bequest goes to his representatives. But if the testator have made any conditions of future payment, the courts examine into his intentions in order to determine whether the interest in the legacy be vested or contingent. In this respect, and concerning familiar cases, two very well settled rules are found in practice. First, if a legacy be "payable" or "to be paid" at any certain time, as "when the legatee arrives at the age of 21," it confers a vested interest immediately on the testator's death, and is transmissible to personal representatives. Secondly, if a gift of property be to the legatee "at 21" (and not merely payable at that age), or when, or if, any determinate thing shall happen, then the time becomes an essential element, and the legacy is contingent; if then the legatee die before the precedent condition be performed, the legacy lapses and fails entirely. With respect to the vesting of legacies charged upon real estate, the general rule seems to be that when the gift is immedi-

ate, but the payment postponed, it is contingent, and will fail if the legatee die before the time of payment arrives; but when the payment is postponed merely in regard to the convenience and circumstances of the person and estate charged with the legacy, and not on account of the age, condition, or circumstances of the legatee, it will be vested, and must be paid although the legatee should die before the time of payment.—Finally, legacies may be lost not only by ademption and lapse, but also by abatement. In the administration of the estate by the executor, legacies must be applied to the payment of debts, if other property is insufficient. General legacies are to be applied before specific, the whole if all be needed, or *pro rata* if the aggregate thus obtained will suffice. But general legacies given for any valuable consideration, as for the relinquishment of dower by the widow, or for a debt actually due, will receive consideration and indulgence before all others. The same remark is true when it is the declared or evident intention of the testator to prefer one legatee to another. Specific legacies suffer abatement only after complete exhaustion of general and residuary legacies. In England, those to whom specific and demonstrative legacies are given can compel the devisees of land not charged to contribute with them *pro rata* toward the payment of debts. This rule is not generally admitted in the United States, though general residuary devisees of land have been charged in the marshalling of assets for contribution to payment of debts before specific legatees.—On the testator's death the entire personal property vests in the executor, who holds it in trust for the payment of debts and other claims. No legacy can be received by the legatee without the assent of the personal representative, though if he withholds this improperly he may be compelled in a court of equity to give it. Probably, under the usual statutes in force in this country, this assent cannot be given until the receipt of letters testamentary from a probate court or other competent jurisdiction in the premises. Statutes generally make legacies payable a year from the time of issuing the letters of administration. If however the will directs the bequest to be paid earlier, the administrator must comply, and may take for his security a bond of indemnification in case of failure of assets. In general interest is not payable on legacies unless payment is delayed beyond a year, or unless given in satisfaction of a debt, or, in special cases, when ordered by the court. A legacy payable to an infant can only be paid to his guardian unless statutes make other provision, as they do in some states in case of small legacies. At common law a bequest to a married woman must be paid to the husband, but this is in many states changed by statutes.

**LEGARÉ, Hugh Swinton**, an American statesman, born in Charleston, S. C., Jan. 2, 1797, died in Boston, June 20, 1843. On the fa-

ther's side he was of French Huguenot stock; on the mother's Scottish. Inoculated with smallpox when a child, the disease fastened on his lower limbs, impaired their growth, and crippled for a time their development. Books were his only refuge from his physical infirmities. At the age of 14 he entered the South Carolina college, where he devoted himself mainly to classical literature and philosophy, and eagerly practised in the debating societies. To become an orator was the chief object of his ambition, and he made great acquisitions both in the classics and modern languages and literatures, though chiefly after leaving college. He graduated in 1814, studied law for three years, and in 1818 went to France. Thence he proceeded to Edinburgh, and entered the classes of civil law, natural philosophy, mathematics, and chemistry, but attended mainly to the civil law. He afterward visited London, made a tour through France, the Low Countries, and the Alps, and returned to Charleston after an absence of two years. He now undertook the care of his mother's cotton plantation on John's island, and was elected to the lower house of the general assembly for its biennial term from 1820 to 1822. In 1822 he removed to Charleston, and engaged for the first time in the practice of his profession. But the very reputation which he had already won as a man of letters was a barrier to his success as a practitioner, and he had the mortification of feeling that he made no progress in the profession to which he had dedicated his life. In 1824 he was chosen from the city a representative in the legislature, and thus continued till 1830, when he was elected attorney general. During the nullification excitement he ardently supported the cause of the Union in public speeches. Pending this conflict, the "Southern Review," a quarterly magazine, was established, ostensibly under the supervision of Stephen Elliott. Legaré was his coadjutor, and the writer upon whom he mostly relied. He wrote the initial article of the first number, on "Classical Literature," and continued to write in each successive number one, two, three, and sometimes more articles, on some of his favorite subjects. On certain occasions when the usual contributors failed, he furnished half the contents of the "Review." It was suspended after the eighth volume, Legaré having been the editor after the death of Elliott. Meanwhile Legaré ably maintained his position as attorney general. In 1832 he was appointed chargé d'affaires at Brussels, where he resumed his varied studies. In the autumn of 1836 he made a tour among the seats of learning in northern Germany, and then returned home. In his published remains, the "Diary of Brussels," &c., will afford some idea equally of his travels, studies, and experiences. Almost immediately after his arrival at Charleston he was elected to congress, taking his seat in the extra session of 1837, called to deliberate on the financial embarrass-

ments of the country. In the debates which followed he greatly increased his reputation. But his course in opposition to the sub-treasury project did not please his constituency, and he was defeated at the next election. He now addressed himself with more determined purpose than ever to his profession. He was soon employed in some cases of great magnitude, then pending in the courts of South Carolina. In the case of "Pell and Wife v. the Executors of Ball," he achieved a great triumph, at once of argument and eloquence, which was everywhere acknowledged. The reputation of a great lawyer could no longer be denied him. In the presidential canvass of 1840 he again took part in politics in favor of Gen. Harrison. About this time, also, he began a series of brilliant papers in the "New York Review" on "Demosthenes," "The Athenian Democracy," "The Origin, History, and Influence of the Roman Law," &c. While thus engaged he was appointed by President Tyler attorney general of the United States. This office gave him ample employment, and sufficiently tasked his vast legal resources, but always to the increase of his reputation. He gave important aid in the conduct of the Ashburton treaty, and the president confided to him the care of the state department when vacated by the withdrawal of Mr. Webster. Accompanying the president to Boston in June, 1843, in order to take part in the Bunker hill celebration of that year, he was seized so severely on the 16th with a visceral derangement that he was unable to join in the ceremonies of the next day. He was removed to the residence of his friend Mr. Ticknor, where he died. His remains, temporarily deposited in a vault at the Mt. Auburn cemetery, were in 1859 removed to Charleston, and interred at Magnolia cemetery, where a handsome monument has been raised to his memory. He was never married. A biography with selections from his writings, including reviews, orations, public despatches, and the "Diary of Brussels," was published at Charleston in 1846, in 2 vols. 8vo.—His sister, MARY SWINTON BULLEN, an artist, born in Charleston, S. C., about 1800, painted a "Spanish Pointer," nearly of life size, and the "Dogs of St. Bernard." In 1849 she emigrated to Lee co., Iowa, and established at West Point an institution called "Legaré college" for the liberal education of women, to the support of which she devoted herself for many years.

**LEGATE** (Lat. *legatus*, one sent with a charge), in ancient Rome, the title given to an ambassador, or to the lieutenant of the supreme civil and military magistrate; in ecclesiastical history, the title of the representative of the pope in the government of one of his temporal provinces, or in his intercourse with sovereigns or with national churches. The Roman senate alone appointed ambassadors, who were generally chosen from among persons of consular rank. Under the republic the dictator, consul, proconsul, and prætor chose their own *legati*

or lieutenants, subject to the approval of the senate. Under the empire, the *legati Cæsaris* were the lieutenants of the emperor in certain provinces the administration of which was reserved to himself.—The representatives of the bishop of Rome at imperial and royal courts, or in councils, or despatched for the settlement of some ecclesiastical difficulty, received the title of *legati* at a very early date. In the middle ages legates fell under a three-fold distinction: *legati à latere* or *de latere*, persons delegated "from the side" of the pontiff, who were generally cardinals; *legati missi* or *dati*, or *nuntii apostolici*, "apostolic nuncios;" and *legati nati*, or "legates born," a title formerly attached to certain ecclesiastical dignities. The archbishops of Canterbury, Toledo, Mentz, Lyons, and Arles claimed in mediæval times the honorary title of "legates born" of the holy see. This title has now fallen into abeyance. That of *legatè à latere* is bestowed on a cardinal sent by the pope on a special mission to a foreign court. This title was also formerly bestowed on the governors of the chief pontifical provinces, hence called legations, such as Ferrara; those not governed by cardinals being called delegations. At present the resident ambassadors or legates of the holy see near first-class powers are called nuncios, and those at second-rate courts have the title of internuncio. Legates *à latere* in mediæval times claimed in all cases, in the countries to which they were sent, the same power as the pope himself when present. This was limited by the council of Trent; and in modern custom legates claim power only for the special cases for which they are sent, and do not interfere with the ordinary jurisdiction of bishops.

**LEGENDRE, Adrien Marie**, a French mathematician, born in Toulouse in 1752, died near Paris, Jan. 10, 1833. He evinced an early taste for mathematics, and through the influence of D'Alembert was appointed in 1774 to a chair in the military school at Paris. In 1782 he gained prizes for two remarkable papers from the academies of science at Paris and Berlin. In 1783 he succeeded D'Alembert at the French academy, and in 1787 was appointed by the government, with Cassini and Méchain, to connect the observatories of Greenwich and Paris by a series of triangles. He presented in 1791 a report of their joint labors, with a description of a new instrument which he had invented and successfully used for measuring angles. In 1794 he published his *Éléments de géométrie*, upon which his reputation principally rests. It has been several times printed in English, the best translation being that of Sir David Brewster. The same year he published a *Mémoire sur les transcendentes elliptiques*. In 1798 appeared his *Essai sur les nombres*, reprinted with additions in 1830, under the title of *Théorie des nombres* (2 vols. 8vo), and in 1805 a *Nouvelle méthode pour déterminer l'orbite des comètes*. These were followed by his *Ex-*

*ercices de calcul intégral sur divers ordres de transcendentes et sur les quadratures* (3 vols. 4to, 1807-'19), in which he attempted to collect all that is most remarkable in the theory of transcendentials and integrals. This subject was enlarged and reduced to a more digested system in his *Traité des fonctions elliptiques et des intégrales eulériennes, avec des tables pour en faciliter le calcul numérique* (3 vols. 4to, 1827-'32). He was appointed in 1808 councillor of the university, and in 1816 examiner of candidates for the polytechnic school.

**LEGGETT, William**, an American author, born in New York in 1802, died May 29, 1839. He was educated at the college in Georgetown, D. C., and in 1819 accompanied his father to Illinois. In 1822 he entered the navy as midshipman, but resigned his warrant in 1826. He had in the previous year published a volume of poems, entitled "Leisure Hours at Sea, by a Midshipman of the U. S. Navy" (18mo, New York). In 1828 he became editor of the

"Critic," a weekly literary journal, which was soon united with the "New York Mirror." He subsequently collected in a volume some of his contributions to these and other publications, under the title of "Tales by a Country Schoolmaster," followed by one entitled "Sketches at Sea." In the summer of 1829 he became one of the editors of the New York "Evening Post," to which journal he was attached till January, 1836. At the outset he stipulated with his principal, Mr. William C. Bryant, that he should not be required to write

on political subjects, as he had no taste for or fixed opinions upon them; but before a year had passed he appeared to have found his true vocation in discussing them. In 1835 the meetings of the abolitionists in New York city were attacked and dispersed by mobs. Leggett denounced these proceedings, and defended the right of free discussion in regard to slavery as well as all other subjects. Having retired from the "Post," he commenced a weekly journal called the "Plaindealer," which attained a large circulation, but was discontinued in less than a year through the failure of its publisher; after which, his health being greatly enfeebled, he ceased literary labor, and lived in retirement at New Rochelle. In 1839 he was appointed by President Van Buren diplomatic agent to Guatemala, but died suddenly while preparing for his departure.

Soon after his death a collection of his "Political Writings," with a memoir, was published by Theodore Sedgwick (2 vols., New York, 1840). Mr. Leggett was remarkable among the journalists of his day as an unflinching advocate of freedom of opinion for his political opponents as well as for the men of his own party. Mr. Bryant, who has written a poem in his memory, describes him as a person fond of study, one delighting to trace principles to their remotest consequences, and greatly gifted with moral courage, having no fear of public opinion as regarded the expression of his own convictions.

**LEGHORN** (It. *Livorno*). **I.** A province of central Italy, in Tuscany, consisting of two districts, the city of Leghorn and the island of Elba; area, 126 sq. m.; pop. in 1872, 118,851. **II.** A city, capital of the province, on the W. coast, in lat. 43° 33' N., lon. 10° 18' E., 12 m. S. by W. of Pisa and 50 m. W. by S. of Florence; pop. in 1872, 97,096, including

The Port of Leghorn.

about 10,000 Jews, who are the richest class of the inhabitants; also Greeks and Armenians, Turks, Moors, Germans, English, &c. The town is of comparatively modern origin, and possesses few remarkable buildings or objects of art. The cathedral is interesting in consequence of the façade having been designed by Inigo Jones. There are seven other Catholic churches, and places of worship for members of the church of England, Scotch Presbyterians, Greeks, and Armenians. The Jews have a richly ornamented synagogue, and the Mohammedans a private mosque. The modern palazzo Lardarel, built by the count of that name, contains a gallery of pictures and statues. There is another palace, formerly the residence of the grand dukes of Tuscany. In the *piazza dei Due Principi*, a large new square, is a statue of the grand duke Ferdi-

nand III., and near the quay is one dedicated to Ferdinand I. There are two *monti di pietà* (public pawn offices), a free library, an observatory, and a citadel. The English cemetery contains the tombs of Smollett and Francis Horner. The monastery of Monte Nero is upon a hill near the town. The three lazarettos of San Rocco, San Jacopo, and San Leopoldo, the first for those who arrive with a clean bill of health (*patente netta*), the second for those with a doubtful (*patente tocca*), and the third for those with a foul bill (*patente brutta*), are well managed establishments. The town possesses a lyceum, a gymnasium, a nautical and a technical school, a scientific academy with a library of 20,000 volumes, and various other educational, scientific, and charitable institutions. It is the seat of a bishop (since 1806), and of a prefect and other provincial authorities. Many of the private houses are elegant, and the vicinity is covered with villas of the wealthy citizens. The town has been greatly enlarged of late years by throwing down many of the old fortifications and including two large suburbs within the walls. It resembles an English town more than any other in Italy, and its commercial and manufacturing importance is constantly increasing. As a Mediterranean seaport it ranks after Marseilles, Genoa, Trieste, and Smyrna. The accommodation for shipping having become insufficient for large vessels, which were obliged to discharge their cargoes in the roads, the government undertook the enlargement of the port. The work is now completed, and ships of large tonnage can enter and remain in safety. There is also a fine dry dock capable of accommodating vessels of the largest size. Being a free port, Leghorn is perhaps better supplied with French and English manufactures than any other town on the continent. The general imports for the year ending September, 1872, were valued at \$14,800,000, the exports at \$15,400,000; the imports from the United States at \$1,180,000, the exports to the United States at \$1,592,000. The number of vessels entered during the same year was 6,401 (American 29), tonnage, 1,079,455; of vessels cleared, 6,232 (American 7), tonnage 1,048,237. The vessels built in Leghorn are mostly for the coasting trade. The chief manufactures are corals, silk, wool, cotton, straw and felt hats, alabaster, porcelain, pottery, leather, and tobacco. There are salt works and many dyeing establishments, and admirably organized distilleries of oil and *rosoglio* (a kind of liqueur). There were in 1873 22 foreign consuls resident here, and the great concourse of sailors and strangers of all nations imparts to the town a very interesting and animated appearance. The natural insalubrity of the site has been remedied by effective draining. Good water is brought to the town by means of a fine aqueduct, which was erected in 1792. In the summer season Leghorn is a favorite resort of the fashionable world

of Florence, Rome, Bologna, Siena, and other cities, the influx of visitors frequently amounting to 20,000.—Leghorn is first mentioned as a village in the 11th century, but became important only after the destruction of the port of Pisa, and particularly in the 15th and 16th centuries under the rule of the Medici. The grand duke Cosmo I. made it a free port and granted many privileges to the town, which continued to improve under his successor Ferdinand I. In 1808 Napoleon annexed it to his empire, and it became the capital of the French department of the Mediterranean. It was taken by the Austrians under Gen. Aspre in 1849, and for a long time subsequently was occupied by an Austrian garrison. In March, 1860, it was annexed with the whole of Tuscany to the dominions of Victor Emanuel.

**LEGNAGO**, a fortified town of Italy, in the province of Verona, on the Adige, 50 m. from its mouth, 26 m. E. of Mantua, and 22 m. S. E. of Verona; pop. about 10,000. It forms with Verona, Peschiera, and Mantua the famous quadrilateral of fortresses, of which it is the S. E. angle, and is the least important. The town is on both banks of the river, which is here crossed by a wooden bridge. It contains a gymnasium, a theatre, and a hospital, has manufactories of hats and fine leather, and is an important depot for agricultural produce, especially rice, which is extensively cultivated in the surrounding district. The original fortifications were largely the work of San Micheli. The French were defeated here in 1701, but captured the place on Sept. 13, 1796, and demolished the works, which the Austrians afterwards rebuilt. A canal connects the Po at Ostiglia with the Adige at Legnago.

**LEGNANO**, a town of Italy, in the province and 16 m. N. W. of the city of Milan, on the river Olona; pop. about 6,500. It is on both sides of the river, which is crossed by two stone bridges, contains three churches and a hospital, and has manufactories of silk and cotton fabrics and dye works. The emperor Frederick Barbarossa was defeated here by the Milanese, May 29, 1176.

**LEGOUVÉ**. **I. Gabriel Marie Jean Baptiste**, a French poet, born in Paris, June 23, 1764, died there, Aug. 30, 1812. He inherited a large fortune from his father, the advocate Jean Baptiste Legouvé. In 1792 he produced *La mort d'Abel*, a tragedy of some merit, which was sharply criticised by La Harpe. His *Épicharis et Néron* (1793), in which the tyrant represented Robespierre, gained great success from the acting of Talma. Among his other works are *Le mérite des femmes*, a didactic poem (1800), and *La mort de Henri IV.*, a tragedy (1806). He was made a member of the institute and adjunct professor of Latin poetry. He became deranged in 1810, in consequence of the death of his wife and other misfortunes, and died in a private asylum. There is a complete edition of his works, by Bouilly and Malo (3 vols., Paris, 1826). **II. Ernest Wilfrid**, a French

dramatist, son of the preceding, born in Paris, Feb. 14, 1807. At an early age he wrote novels, plays, and poems, and his lectures on *L'Histoire morale des femmes* were published in 1848. In 1849, in conjunction with Scribe, he produced *Adrienne Lecouvreur*, which gained great popularity through the personation of the heroine by Rachel. She, however, paid a fine of 5,000 francs rather than perform in his *Médée*, a play which in Montanelli's Italian version was in 1856 very successful with Ristori. In 1856 he succeeded Ancelot as a member of the academy. Among his works are *Béatrix* (1861), *La croix d'honneur et les comédiens* (1863), *Miss Suzanne* (1867), and *Messieurs les enfants* (1868).

**LEGRAND DU SAULLE, Henri**, a French physician, born in Dijon in 1830. He was one of the writers of the *Gazette des Hôpitaux* (1854-'61), and of other medical journals, and became in 1867 physician at the Bicêtre. He is a high authority on the treatment of the insane, and his *Folie devant les tribunaux* (Paris, 1864) obtained an academical prize. Among his numerous other writings is *Le délire des persécutions* (1871), suggested by the warfare against the followers of the commune.

**LEH**, or **Le**, a city of Cashmere, India, capital of the province of Ladakh, situated in the upper part of an open valley of the Himalaya, 3 m. N. of the Indus and 11,500 ft. above the sea, about 150 m. E. of Serinagar or Cashmere; lat. 34° 8' 5" N., lon. 77° 40' 36" E.; pop. variously estimated from 5,000 to 12,000. It covers the slope and surrounds the base of a low spur on the E. side of the valley, the middle and W. side of which are occupied

with flat roofs. One of the most striking buildings is the rajah's palace, a huge pile of masonry upon a high rocky pinnacle in the centre of the town. There are also several picturesque temples. Outside of the walls, in a valley surrounded by hills, is a large cemetery containing many groups of monumental buildings, far exceeding in number the houses of the living. Leh is an important commercial centre, it being the place of rendezvous for merchants travelling to and from Yarkand, and the principal market for the sale of the shawl wool of East Turkistan. In the summer, when the caravans from central Asia and India meet there, its population is greatly increased. The town is called Ladak by Capt. Knight in his "Diary of a Pedestrian in Cashmere and Thibet" (London, 1863).

**LEHIGH**, a river of Pennsylvania, rising near Wilkesbarre, Luzerne co., in the N. E. part of the state, and uniting with the Delaware at Easton after a S. S. E. course of about 90 m. In its upper course it is a rapid and picturesque mountain stream, broken by several falls. It passes through a rich coal region, for the products of which it serves as an outlet. It breaks through the Blue Ridge 12 m. below Mauch Chunk, to which place, the terminus of the slackwater navigation, it is navigable by canal boats.

**LEHIGH**, an E. county of Pennsylvania, bounded N. W. by the Kittatinny or Blue mountains, and S. E. by South mountain, and drained by Lehigh river; area, 389 sq. m.; pop. in 1870, 56,796. It abounds in iron ore, limestone, and clay slate, and has an undulating surface and a fertile soil.

The railroads passing through it are the Lehigh Valley, the East Pennsylvania, the Catasauqua and Fogelsville, and the North Pennsylvania. The chief productions in 1870 were 361,209 bushels of wheat, 162,147 of rye, 549,480 of Indian corn, 530,632 of oats, 279,718 of potatoes, 915,818 lbs. of butter, and 38,726 tons of hay. There were 7,816 horses, 11,591 milch cows, 6,847 other cattle, 3,123 sheep, and 17,505 swine; 13 manufactories of agricultural implements, 23 of brick, 35 of carriages, 2 of cars, 1 of refined petroleum, 24 of iron, 10 of lime, 10 of machinery, 13 of roofing materials, 24 of saddlery and harness, 5 of

The Rajah's Palace, Leh.

by extensive cultivated tracts, the fields rising in terraces one above another. It is surrounded by a wall defended at intervals by towers. The streets are irregular and intricate. The houses are mostly of stone or of unbaked brick,

sash, doors, and blinds, 19 of tin, copper, and sheet-iron ware, 34 of chewing and smoking tobacco, 2 of woollen goods, 6 breweries, 24 tanneries, 25 currying establishments, 7 saw mills, and 21 flour mills. Capital, Allentown.

**LEHMANN, Charles Ernest Rodolphe Henri**, a French painter, of German origin, born in Kiel, Holstein, April 14, 1814. He studied under his father and under Ingres in Paris. He exhibited a religious picture in 1835, followed by many other works, among which are portraits and mural paintings for the hôtel de ville and other public buildings. His pictures are valued for their fine coloring and expression. In 1864 he became a member of the academy of fine arts.—His brother РОДОЛФЕ (born in 1819), who resides in Rome, excels in Italian genre pictures and landscapes.

**LEIBNITZ**, or **Leibniz**, **Gottfried Wilhelm**, a German philosopher, born in Leipsic at the beginning of July, 1646, died in Hanover, Nov. 14, 1716. His father, a professor in the university, died when he was six years old. He enjoyed by the care of his mother the best privileges of education which Germany then afforded, but declares that he was for the most part self-taught, and relates that he would withdraw from school to shut himself up whole days in his father's library. At the St. Nicholas gymnasium in Leipsic he incurred the remonstrances of his masters by learning Latin and reading the classics in advance of the regular course. Before he was 12, he says, he "understood the Latin authors very well, had begun to lisp Greek, and wrote verses with singular success." He was already studying the greatest modern as well as ancient philosophers, was comparing Bacon and Descartes with Aristotle and Plato, and was aiming to grasp the unity of all the sciences. At the age of 15 he entered the university of Leipsic, applied himself chiefly to mathematics, philosophy, and law, continued his studies for a short time at Jena, returned to Leipsic, and produced remarkable theses on occasion of receiving his degrees. His treatise *De Principio Individui*, his academic exercise on becoming bachelor of philosophy, is perhaps the most extraordinary demonstration of erudition and power of thought ever achieved by a youth of 17. It was the fruit of severe boyish deliberation whether or not he should give up the substantial forms of the schoolmen, prefigured his future philosophy by its vivid statement of individuality as the fundamental principle of ontology, and was the last noticeable work written in the sense and style of scholasticism. In it he declares for nominalism. His three theses on becoming bachelor and licentiate of law were published, and he wished to crown his studies in jurisprudence with the degree of doctor; but this was refused him on pretence of his youth by the superiors of the college, whose ill will he had in some way incurred. He therefore left his native city, never to return. At the university of Altdorf he maintained his thesis for the doctorate in 1666 with so brilliant success that a professorship was immediately offered him, which he declined. He fell in with a society of Rosicrucians and alchemists at Nuremberg, became their secre-

tary, recorded their experiments, and explored the hermetic authors for revelations concerning the philosopher's stone, but was soon ready for more hopeful labors. In 1667 he met the baron of Boyneburg, ex-chancellor of the elector of Mentz, who was captivated by his genius, and invited him to Frankfort, where he immediately composed his *Nova Methodus Discendæ Docendæque Jurisprudentiæ* (1668), in which he shows his admiration of the Roman law and proposes the registry of all its enactments in chronological order. In the following year appeared his *Corporis Juris Reconcinnandi Ratio*, in which the arrangement of Justinian is disapproved, and all law is reduced to nine heads: general principles of rights and actions, rights of persons, judgments, real rights, contracts, successions, crimes, public rights, and sacred rights. In the treatment of these departments he proposes to retain the texts of the *Corpus Juris Civilis*, but to follow the method of the Pandects rather than of the Institutes. The versatile genius and various pursuits of Leibnitz soon withdrew him from the science of philosophical jurisprudence. "He did but pass over that kingdom," says Lermnier, "and he reformed and enlarged it." In 1669 he produced, at the instance of Boyneburg, an anonymous treatise in favor of the claims of the prince of Neuburg to the vacant throne of Poland, in reward for which he was made councillor of the elector of Mentz. This office, which he retained three years, furnished him leisure to prosecute vast studies in politics, physics, and philosophy. He extended his fame as a philosopher by republishing and annotating the *Antibarbarus Philosophus* of Nizolius (1670), in which he ranks Aristotle above Descartes; wrote a theological argument in defence of the Trinity, *Sacrosancta Trinitas* (1671), aimed against the Polish Socinian Wisnowatius, who had procured the erection of a temple to the harmony of the three Christian confessions; addressed to the academy of sciences of Paris and to the royal society of London two remarkable memoirs on the laws of motion; and entered into correspondence with Spinoza by sending him an account of the progress of optics. One of his projects at this time was for a reunion of the Lutheran and Roman Catholic churches, concerning which he had a long correspondence with Bossuet. In 1672 he was sent by Boyneburg to accompany his son to Paris, then the residence of the most learned men of the age under the patronage of Louis XIV. Associated with Cassini, Huygens, and others, he devoted himself especially to mathematics and physics, and established a European reputation by bold and striking thoughts in all departments of learning. To Colbert he presented a new arithmetical machine, an improvement on that of Pascal, which was favorably noticed by the academy of sciences. To the king he addressed a memorial for an expedition to Egypt, an eminent instance of political foresight. "The con-

quest of Egypt," he says, "will give supremacy on the sea, the commerce with India, predominance in Christendom, and even an empire in the Orient on the ruins of the Ottoman power." Another of his suggestions to Louis XIV. was for the publication of a general repertory of human knowledge in the form of a dictionary, thus presenting all the results of scientific labor in their mutual dependences. He proposed illustrated treatises on natural history, and states that his own preference would have been to study the laws established by God in nature rather than the laws and customs created by men for themselves. Several members of the academy of sciences suggested to him that he would be admitted to that body as a pensioner, provided he would become a Catholic; but he declined to accept the offer under this condition. In 1673 he visited England, became personally acquainted with Newton, Boyle, Oldenburg, Wallis, and Collins, and was elected a member of the royal society. On his return to Paris in the same year he received instructions in the higher mechanics and analysis from Huygens, to whom, in a letter to the countess Kielmancegge, he acknowledges himself indebted in his mathematical studies which resulted in the discovery of the differential calculus. The death of Boyneburg, soon followed by that of the elector of Mentz (1674), left him without a patron, and he determined to return to Germany. At Paris he received from the duke of Brunswick-Lüneburg an appointment as councillor, with a pension and with permission to prolong his absence at pleasure. He remained in France till 1676, again visited London, passed through Holland, met with Spinoza at the Hague, and on his arrival in Hanover, the residence of the duke of Brunswick, became his librarian, and was partially occupied for six years in arranging and enriching his library. At the congress of Nimeguen (1677) there was a dispute about the right of precedence between the princes who were electors and those who were not. Leibnitz maintained the cause of the latter in a treatise containing the ultramontane rather than Protestant declaration that all the states of Christendom should form but a single body, having the pope for their spiritual and the emperor for their temporal head. This idea of a grand theocracy appears prominently in several of his writings, alike in his views of society and of nature. Theology he defined as the jurisprudence of the kingdom of God, as law and politics transferred to a higher and absolute sphere. He was one of the founders in 1682 of the *Acta Eruditorum* of Leipsic, to which he furnished numerous articles. Employed to write the history of the house of Brunswick, he explored the principal libraries and archives of Germany and Italy for materials, returning to Hanover in 1690. The fruits of his researches were the *Codex Juris Gentium Diplomaticus* (2 vols., 1693-1700), a collection of treaties and public documents, with

a preface which is one of his masterpieces; *Accessiones Historicae* (2 vols., 1698-1700); *Scriptores Rerum Brunsvicensium Illustrationi Inservientes* (3 vols., 1707-'11); and the *Annales Imperii Occidentis Brunsvicensis* (first published by Pertz, 2 vols., 1843-'5). His *Protogaea* (first published entire in 1749), a dissertation on the state of the globe before the creation of man, was intended as an introduction to the last work, and was the first important contribution to the science of geology, which he called natural geography. His hypothesis supposes the prominence of fire in the formation of the earth, the gradual congelation after igneous fusion, the introduction of a vast body of water to cover the surface, and the origin of mountains and valleys by the subsidence of certain portions of the earth breaking in upon vast vaulted caverns. To his influence was chiefly due the foundation of the academy of sciences at Berlin, of which he became the first president in 1702. The first memoir which he presented to the academy was on a binary system of arithmetic, in which the base of the scale of numeration was the number 2 instead of 10, and the only figures used were 1 and 0. He soon after attempted to form a universal alphabet, the elements of which were to be very simple, like algebraic signs, instead of syllables and words, and were directly to represent ideas. This favorite but futile scheme was the subject of long continued meditations. To Augustus, king of Poland and elector of Saxony, he addressed a series of precepts for the advancement of sciences, with a curious preamble; and to this period belong his most important philosophical labors. In 1704 he composed his examination of Locke, *Nouveaux essais sur l'entendement humain*; he revealed the great variety of his learning in the first volume of the *Miscellanea Berolinensia* (1710); was a frequent contributor to the *Journal de Trévoux* and the *Journal des Savants*; and published in 1710 in French his *Théodicée*, the noblest monument of his genius, in which he grapples with the leading problems of philosophy and faith, and which is hardly surpassed as an example at once of metaphysical power and universal erudition. During the latter years of his life he enjoyed the highest personal distinction. A councillor and official historiographer at Hanover, a baron and aulic councillor with a pension at Vienna, he was consulted by Peter the Great at Torgau in 1711, and rewarded by him with the title of councillor of state and a pension of 1,000 rubles. He had for many years corresponded with the most illustrious persons in Europe on almost all public and scientific questions. He united the leading thinkers of Christendom by an interchange of ideas, and from his time the history of philosophy involves more than in any former period the general history of the human mind. To no single person is the civilized world more indebted for the literary commerce between all its parts. To Spinoza he wrote,

suggesting new methods of manufacturing lenses; to Magliabecchi at Florence, urging him in elegant Latin verses to publish his bibliographical discoveries; to the elector of Saxony, on the culture of the silkworm; to Grimaldi, the Jesuit missionary in China, to impart his researches in Chinese philosophy, and to prevail on the emperor to introduce his new binary arithmetic, suggesting that the latter may be a key to the book *Ye-kim*, supposed to contain the mysteries of Fo; to Bossuet and Mme. Brinon concerning the union of the Protestant and Catholic churches, and to Spanheim on the union of the Lutheran and Reformed; to Père des Bosses on transubstantiation, and to Dr. Samuel Clarke on time and space; to Remond de Montmort on Plato, and to Francke on popular education; to the queen of Prussia, his pupil, on free will and predestination; to the electress Sophia, her mother, on English politics; and to the cabinet of Peter the Great on the Slavic and oriental languages. A controversy with Newton concerning the discovery of the differential calculus embittered the latter years of his life. There is little doubt that Newton's method of fluxions and Leibnitz's method of infinitesimals were both independent and original discoveries; but the priority of publication belongs to Leibnitz, who gave a summary of the principles of the differential calculus in the *Acta Eruditorum* in 1684. Sir David Brewster's account of this matter, in his "Life of Newton," is, according to the German authorities Gerhart and Guhrauer, very incomplete, ignoring some important documents, particularly a letter of Leibnitz to Oldenburg dated Aug. 27, 1676. The royal society of London appointed a commission to examine the question, whose report, *Commercium Epistolicum* (1712), was in favor of Newton. This is admitted not to have been impartial, and its deficiencies are shown in a revised edition by Biot and Lefort (1856).—The principal metaphysical speculations of Leibnitz are contained in his *Théodicée, Nouveaux essais, Système nouveau de la nature* (1695), *De Ipsa Natura* (1698), the fragment on *Monadologie* (1714), and in portions of his correspondence. He was too much occupied with all the learning of Europe to give a complete and systematic development of his opinions either in this or any other department. His mind was nurtured in the controversy between the principles of Descartes and Locke, the ultimate tendencies of each of which he was able to perceive, and between which he wished to establish a position. He controverted Locke's rejection of innate ideas, by maintaining that, though no ideas be innate, there is yet an innate faculty for forming ideas independent of and superior to sensation. To the old axiom of sensualism, *Nihil est in intellectu, quod non fuerit prius in sensu*, he made the revolutionary addition, *nisi ipse intellectus*. The mind he compares not to a *tabula rasa*, a blank tablet, but to a block of marble that has

certain characteristic veins in it; affirms it to contain potentially in itself the general notions of things, which are unfolded as occasions invite, the germs of our ideas and of the eternal truths which are derived from them. Those necessary truths, which take their origin not from experience, but primarily from the thinking soul, are the elements of all knowledge. Thus, unlike that of Locke, the starting point of his philosophy is not the products of sensation, but the laws of the understanding; and he creates not a system of empiricism, but a system of rationalism. He departs almost equally from the results of Cartesianism as developed by Malebranche and Spinoza. In Descartes the prominence of the idea of the infinite or absolute tends to cast finite nature into the shade. This tendency appears more decidedly in Malebranche, who denied second causes, and limited all real agency to the Supreme Being, and in Spinoza, who affirmed all thought and substance to be alike parts and modifications of the one sole Existence. Thus the idea of cause was banished from the universe of created things, and all phenomena were regarded only as modes of the divine action. To avoid this result, to vindicate the notion of causality, was the object which Leibnitz had in view in declaring all matter to be necessarily active. He affirmed that one body cannot receive the power of acting from any other, but that the whole force is preëxistent in itself. He thus substituted in the study of nature the notion of force for that of mode, the form of dynamics for the form of abstract geometry. This principle is the key to his peculiar system. He begins with maintaining that the pure *à priori* conceptions of the reason are full and adequate expressions of objective realities. Logical truth is equivalent to actual truth; rational possibility is necessarily reality; ideas are identical with things. He introduces the two test principles of contradiction and sufficient reason, the former applying to the realm of necessary ideas, the latter to that of contingent facts. Whatever abstract conception involves no contradiction with the reason itself is absolutely true. But to determine what ideas are valid in any world of contingent phenomena, in any particular circumstances, there is needed the second principle. For every actual truth a sufficient reason must be rendered, showing that it is that which is best adapted to bring about the intended result. Thus everything must be judged by its final cause. The Cartesian doctrine, that substance consists essentially in extension, does not explain the constant movements and developments of nature. Unless, therefore, every phenomenon be regarded as a direct product of the divine mind, Leibnitz maintains that some inherent, causative, initiative power must be attributed to matter. This power cannot reside in masses as such, since they are infinitely divisible, and may therefore be reduced to a zero of ex-

tension, till they lose every material property. Hence his doctrine of monads, as the simple active elements of things, the veritable, living atoms of nature, the immaterial, indivisible, and final forces of the universe, uninfluenced from without, but continually changing by an inward principle. All monads contain an inward energy by virtue of which they develop themselves spontaneously; they are all different from each other, each having peculiar attributes; all are, properly speaking, souls, being endowed with perception, though those which compose material objects do not possess apperception or consciousness; all are independent of each other, each having its own means of development, and forming a microcosm or living image of the whole universe. In every monad might be read the world's history from beginning to end, each of them being a kind of deity (*parvus in suo genere deus*). God is the absolute, original monad, from which all the rest are generated; the primitive and necessary substance, in which the detail of changes exists emanantly. Hence follows another doctrine of Leibnitz's philosophy, that of preëstablished harmony. The dualism of Descartes is rendered unnecessary by the reduction of mind and matter to the same essence, the former being represented by conscious and the latter by unconscious monads. But these two classes of monads are wholly unlike, and exert no influence on each other. To explain their relation, therefore, Leibnitz reverts to the original constitution of things as perfected by God himself, who, he maintains, has so harmonized all the monads of which the universe is composed, that they work in complete unison in order to accomplish the end for which they were intended. This harmony is not only pre-established by a divine decree, but is produced by virtue of the very nature of monads. In one view every volition of a rational agent finds in the constant procession of physical forces a concurrent event by which it is executed; and in another view, the monads of the human system and of the outward universe are so accommodated to each other, each being a representative of all the rest and a mirror of all things, that each feels all that passes in every other, and all conspire together in every act, more or less effectively in proportion to their nearness to the prime agent. Hence the harmony between all the parts of matter, between the future and the past, between divine decrees and human actions, between the reign of efficient and that of final causes. The transition from these principles to Leibnitz's doctrine of optimism is easy. Evil is a necessary condition of finite being. The existing universe is one of innumerable possible universes, each of which would have had a different measure of good and evil. The present was made actual, because it presented to the Divine Intelligence the smallest degree of the latter and the largest of the former. Metaphysical evil consists simply in limitation, and

moral evil is permitted only for the sake of a greater ultimate good. It follows that he maintained the doctrine of philosophical necessity as the only kind of liberty consistent with the preëstablished order of the universe. The want of a logical and connected statement of the philosophy of Leibnitz was supplied by his disciple Wolf.—Leibnitz was of medium stature, of a spare but vigorous frame, was accustomed to eat much and drink little, regulated his meals by his pursuits and not by time, usually studied far into the night, sometimes sat by his desk almost without rising for months, sleeping in his chair, liked to converse with all sorts of people, and was never married. He wrote very little in his native language, his important treatises being either in Latin or French. His philosophical works were edited by Erdmann (Berlin, 1840). The collective edition by Pertz comprises altogether 12 volumes (Hanover, 1843-'62), consisting of *Geschichte*, prepared by Pertz himself (4 vols., 1843-'7); *Philosophie*, by Grotefend (1 vol., 1846); and *Mathematik*, by Gerhardt (7 vols., 1849-'62). See also Foucher de Careil's *Œuvres de Leibnitz*, from original documents, with annotations (6 vols., Paris, 1859-'65 *et seq.*), and the complete edition by Onno Klopp (6 vols., Hanover, 1864-'72 *et seq.*). The best biography is by Guhrauer (2 vols., Breslau, 1842; with additions, 1846). This is the basis of the "Life of Leibnitz," by J. M. Mackie (Boston, 1845).—Compare Schelling, *Leibnitz als Denker*; Hartenstein, *De Materia apud Leibnitz Notitione*; Helferich, *Spinoza und Leibnitz, oder das Wesen des Idealismus und Realismus*; Feuerbach, *Darstellung, Entwicklung und Kritik der Leibnitz'schen Philosophie* (Ansbach, 1837); Zimmermann, *Leibnitz und Herbart* (Vienna, 1849), and *Das Rechtsprinzip bei Leibnitz* (1852); Kvet, *Leibnitz's Logik* (Prague, 1857); the writings relating to his works by Bonifas (Paris, 1863), Thilo (Berlin, 1864), Summer (Göttingen, 1866), and Jacoby (Berlin, 1867); Durdik's *Leibnitz und Newton* (Halle, 1869); and *Leibnitz'sche Gedanken in der Naturwissenschaft*, by Du Bois-Reymond (Berlin, 1871).

**LEICESTER** (anc. *Rato*), a manufacturing town of England, capital of Leicestershire, situated near the centre of the county, on the right bank of the Soar, which is here crossed by three ancient bridges and a handsome modern one, 87 m. N. N. W. of London; pop. in 1871, 95,220. It has a Latin school, an insane asylum, an orphan house, a school of design, a philosophical society, a mechanics' hall, a museum with Roman antiquities, a theatre, a public library, and 54 places of worship, of which 11 belong to the established church. The staple manufacture is cotton and worsted hosiery. It is the centre of a great agricultural and wool-raising district, and fairs are held for horses, cattle, and sheep 12 times a year. Under the Romans as well as under the Saxons Leicester

was a place of importance; and numerous vestiges of those ancient times are still in existence. In 1851 tessellated pavements and other Roman remains were discovered. The name

**LEICHHARDT, Ludwig**, a German explorer, born at Trebatsch, Prussia, Oct. 23, 1813, died in Australia in 1848. He travelled from Göttingen and Berlin, being aided by William Nicholson, a physician of Bristol, whom he accompanied to France, Italy, and England, and who also enabled him to go to Australia in 1841. From Sydney he made several excursions into the interior, gathering much valuable information. A subscription amounting to £125 having been raised to fit out an exploring expedition under his charge, he left Moreton bay, on the E. coast, in August, 1844, with seven companions, crossed what is now the colony of Queensland and the S. part of York peninsula, rounded the gulf of Carpentaria, and reached the settlement

Magazine and Newark Gate, Leicester.

Leicester is derived from the river Leire (now Soar). Leicester had formerly a mint in which were produced a succession of coins from the time of the Saxon Athelstan to Henry II.

**LEICESTER, Earl of.** See DUDLEY, ROBERT.

**LEICESTER OF HOLKHAM.** See COKE, THOMAS WILLIAM.

**LEICESTERSHIRE**, a central county of England, bordering on the counties of Nottingham, Lincoln, Rutland, Northampton, Warwick, Stafford, and Derby; area, 797 sq. m.; pop. in 1871, 269,811. The surface consists almost entirely of gently rising hills, but nowhere presents any bold features. It is chiefly included in the basin of the Trent, the principal tributary of which in Leicestershire is the Soar (anc. *Leire*). The Avon, a tributary of the Severn, forms the S. boundary for nearly 8 m.; and the Welland, which falls into the Wash, for about 17 m., separating Leicester from Northamptonshire. The E. portion of the county belongs to the lias formation, and the W. to the sandstone. Coal exists to a considerable extent in the west. Limestone, gypsum, slate, whetstones, and clay are also found. The climate is mild and genial. The soil is loamy, and varies in fertility. The best soils are generally kept in pasture, for which the county is preëminent. The principal crop is barley; but wheat, oats, and beans are extensively cultivated. Leicestershire has long been famous as a hunting county, Melton-Mowbray being the headquarters of the sportsmen. The chief towns are Leicester (the county town), Ashby-de-la-Zouch, Bosworth, Market-Harborough, Lutterworth, Melton-Mowbray, Mount Sorrel, Whitwick, and Castle Donnington.

of Victoria Dec. 17, 1845, whence he returned by water to Sydney, arriving March 29, 1846. In October he again set out, hoping to find a direct passage across Australia to the N. coast; but he was repeatedly baffled, and was unable to carry out his project until December, 1847. His last letter was dated at Fitzroy Downs, W. of Moreton bay, April 8, 1848. Reports of his having been killed were received in 1850, and were confirmed in 1852 by the searching expedition of Hovenden Hely. In 1862 Conn and Giles discovered graves which were supposed to be those of Leichhardt and his companions; but new expeditions under MacIntyre in 1865 and Forrest in 1869 failed to throw light upon the fate of the explorer. In 1872 the authorities of Sydney sent out Andrew Hume, who affirmed that in 1862 he had met with Classen, the brother-in-law of Leichhardt, and his second in command, at a native settlement near the head of Sturt's creek. Hume returned to Sydney in February, 1874, and reported that he had again met Classen with the same natives, who had in the mean time removed to the head waters of Fitzroy river. According to Hume's report of Classen's statement, Leichhardt's men mutinied at the head of Victoria river, and were afterward killed by the natives; Leichhardt dying from want five days after the mutiny, and being buried in a hollow tree, according to the custom of the natives, and the life of Classen being spared on account of his skill in medicine. Hume professed to have in his possession the watch and quadrant of Leichhardt, a portion of his diary, and a written statement drawn up by Classen. He also discovered a letter written by Leichhardt at

Darling Downs, in February, 1848, in which he expressed great delight at receiving medals from the London and Paris geographical societies, and said that he was about to explore Victoria river. Leichhardt wrote "Journal of an Overland Expedition in Australia, from Moreton Bay to Port Essington" (London, 1847; German translation by Zuchold, Halle, 1851), and *Beiträge zur Geologie von Australien* (Halle, 1855). His biography has been written by Zuchold (Leipsic, 1856).

**LEIDY, Joseph**, an American naturalist, born in Philadelphia, Sept. 9, 1823. In 1844 he graduated M. D. at the university of Pennsylvania, and began the practice of medicine; but he soon devoted himself to teaching, and to original work in the biological sciences. In 1846 he was chosen chairman of the curators of the national academy of sciences, and in 1853 professor of anatomy in the university of Pennsylvania, which chair he still fills (1874). In March, 1871, he was appointed professor of natural history in Swarthmore college, teaching zoölogy, comparative anatomy and physiology, mineralogy, and geology, without intermitting his duties in the university. During the civil war his scientific labors were to a great extent arrested by his services as acting assistant surgeon in Satterlee hospital, Philadelphia. His contributions to scientific periodicals number nearly 800. He has also written "Flora and Fauna within Living Animals," "Ancient Fauna of Nebraska," and "Cretaceous Reptiles of the United States" (published by the Smithsonian institution); "The Extinct Mammalian Fauna of Dakota and Nebraska, together with a Synopsis of the Mammalian Remains of North America" (4to, 30 plates, Philadelphia, 1870); and "Contributions to the Extinct Vertebrate Fauna of the Western Territories" (4to, 37 plates, Washington, 1873).

**LEIGH, Benjamin Watkins**, an American lawyer, born in Chesterfield co., Va., June 18, 1781, died Feb. 2, 1849. He studied at William and Mary college, and when he became of age was admitted to the bar. He practised successfully in Petersburg, Va., and was soon elected to the legislature from Dinwiddie co., presenting in that body a series of resolutions asserting the right of the legislature to instruct the United States senators from Virginia. In 1818 he removed to Richmond, where he at once took a high place at the bar. He was one of the commissioners appointed to revise the statutes of Virginia, and reported the arguments and decisions in the court of appeals. In 1822 he was sent as commissioner to Kentucky, and, in concert with Mr. Clay on the part of that state, adjusted an agreement concerning the "occupying claimants law," which threatened to annul the Virginia titles to lands in Kentucky. He was a member of the convention of 1829-30, in which he held a prominent position, and in 1835 was elected to the United States senate, where he took an active part in debate; but finding that his views were not

those of the majority of his constituents, he resigned in 1837, and passed the remainder of his life in retirement.

**LEIGHTON, Frederick**, an English painter, born at Scarborough, Dec. 3, 1830. He studied principally in Italy and Germany. His first great work, "Cimabue finding Giotto drawing in the Fields," was produced in 1848. Among his other works are: "The Death of Brunellesco"; "Cimabue," representing the triumphal procession in Florence at the reception of that master's "Madonna," which was exhibited in 1855, and at once purchased by the queen; "Orpheus redeeming his Wife from Hades" (1856); "Scene from Romeo and Juliet" (1858); "Looking at the Autumn Fields" (1859); "Capri at Sunrise" (1860); "Paolo and Francesca" and "Lieder ohne Worte" (1861); "The Star of Bethlehem" and "Michel Angelo nursing his dying Servant" (1862); "A Girl feeding Peacocks" and "An Italian Crossbowman" (1863); "Golden Hours" (1864); "Helen of Troy," "David," and "Mother and Child" (1865); "Syracusan Bride leading Wild Beasts in Procession" (1866); "Nude Venus" (1867); and "Clytemnestra" (1874). He has illustrated several books, including George Eliot's "Romola."

**LEIGHTON, Robert**, a Scottish prelate, born in Edinburgh in 1611, died in London, June 26, 1684. He was educated at the university of Edinburgh, in 1641 became pastor of a Presbyterian church, and in 1653 principal of the university of Edinburgh. On the accession of Charles II. an attempt was made to establish episcopacy in Scotland. Leighton was favorably disposed toward the system, though his father had been savagely persecuted by Laud for his opposition to it; and, in the hope of moderating the violent dissensions of the time, he reluctantly consented to accept a bishopric, choosing that of Dumblane as being one of the poorest in revenue. In 1670, on the resignation of Sharpe, he was transferred to the archbishopric of Glasgow; but finding himself unequal to the difficulties of his new dignity, he resigned it in 1674, retired to England, and spent his remaining days in that country. He left various works, the best known of which is his "Practical Commentary on the First Epistle General of St. Peter." A complete edition of his writings appeared in 1808 (6 vols. 8vo, London). Among other editions is that by Pearson (London, 1828, and New York, 1859); the latest edition was published in London in 1871, in 6 vols.

**LEINSTER**, one of the four provinces of Ireland, constituting the S. E. part of the island, between lat. 52° 7' and 54° 6' N., and lon. 6° and 8° 8' W., bounded N. by Ulster, E. by St. George's channel, S. by the Irish sea, and W. by Munster and Connaught; length N. and S., 132 m.; greatest breadth, 82 m.; area, 7,558 sq. m.; pop. in 1871, 1,335,966 (in 1841, 1,973,781). It is divided into 12 counties: Carlow, Dublin, Kildare, Kilkenny, King's,

Longford, Louth, Meath, Queen's, Westmeath, Wexford, and Wicklow, besides the cities of Dublin and Kilkenny, and the town of Drogheda, which are counties in themselves. The coast is generally low, but in some places bold and rocky. The best harbors are at Dublin, Drogheda, Dundalk, and Carlingford. There are no large lakes. The province contains six navigable rivers, the Shannon, Barrow, Nore, Boyne, Liffey, and Slaney. The surface is partly level and partly rolling, being on the whole the least broken portion of Ireland. There are three or four mountain groups occupying parts of Dublin, Wicklow, Carlow, Wexford, Queen's, and King's counties, and a few hills in Westmeath, Louth, and Kilkenny. Elsewhere are large peat fields, the principal of which is the great bog of Allen. The soil, resting on limestone and clay slate, is the best

in the kingdom. The Kilkenny coal field, between the Barrow and Nore, is the most extensively worked in Ireland, and also produces excellent ironstone. Wicklow has five copper and four lead mines, yielding silver, and in Croghan there is a gold mine, now abandoned. At the time of the Anglo-Norman invasion in the 12th century Leinster was divided into two kingdoms, Meath in the north and Legania or Leinster proper in the south.

**LEIPA**, a town of Bohemia, on the Bolzen, 41 m. N. by E. of Prague; pop. in 1869, 9,244. It has a gymnasium, and a flourishing industry, the principal manufactures being cloth, linen, steel ware, cotton goods, and vinegar. The town suffered severely during the Hussite, thirty years', and seven years' wars.

**LEIPSIC** (Ger. *Leipzig*), a city of Saxony, in an extensive and fertile valley, watered by the

Town Hall and Market Place, Leipsic.

Pleisse, here joined by the Elster and other small rivers, within a few miles of the Prussian frontier, 60 m. W. N. W. of Dresden, and 92 m. S. S. W. of Berlin; pop. in 1871, 106,925. Most of the ancient fortifications, excepting the castle or citadel of Pleissenburg, have been converted into public walks and partly laid out as gardens. The most fashionable public square is the Augustusplatz; and the most picturesque from the quaintness of its buildings, particularly of the town hall (*Rathhaus*), is the Markt-platz. The allied sovereigns met in this square after the battle of Leipsic, previous to which Napoleon had resided there in the *Königshaus*, so called from having formerly served as an electoral and royal residence. Near the square stands Auerbach's cellar, made famous by Goethe's "Faust," and still frequented by the students. The principal Protestant churches

are those of St. Nicholas, St. Thomas, and St. Paul's or university church. Leipsic contains monuments of Gellert, Prince Poniatowski, who was drowned in the Elster at the close of the great battle in 1813, Hahnemann, Bach, and other eminent persons. Among the principal public buildings are the observatory, which occupies the tower of the citadel of Pleissenburg, the general exchange and book exchange, the Saxon-Bavarian railway depot, the post office, the custom house (finished in 1853), the new city theatre (finished in 1868), and the new city hospital (opened in 1871). Leipsic takes a foremost position in Germany, in the history of the reformation as well as of literature. The university is one of the oldest in Germany; the 450th anniversary of its foundation was celebrated in December, 1859. Prominent among the university buildings is

the *Augusteum*, 300 ft. long and three stories high, containing a great hall, lecture room, museums of natural history, and a library with 200,000 volumes and 2,500 manuscripts. The use of the German language as a medium of public learned instruction was first introduced at Leipsic in 1688 by Thomasius, the son of the teacher of Leibnitz. The university is one of the few scholastic establishments on the continent which have retained their own landed estates. The property of the institution is very considerable, and embraces, besides a number of landed estates, 41 large buildings in the city; and the endowment for stipends, free board, &c., amounts to over \$500,000, nearly 200 poor students being sometimes supported by the university. Philology was long the great speciality of the university, although many of its leading members have been eminent in other branches. About the middle of the present century the university suffered greatly from the anti-liberal policy of the Saxon government, which caused a number of the most eminent professors to leave, and the attendance of students diminished from 1,300 in the early part of the century to about 800 in 1860. Since then it has not only recovered from these losses, but become in every respect one of the most prominent universities of Germany. The number of matriculated students rose to 1,179 in 1866, 1,803 in 1871, 2,204 in 1872, 2,650 in 1873, and 2,876 for the winter of 1873-'4, including 45 from the United States. The numbers for the last two years exceeded those of any other German university. Among its 107 professors were some of the most eminent scholars of Germany; as Delitzsch and Tischendorf in the theological faculty; Wächter and Hänel in the law faculty; Weber, Wunderlich, Czermak, Bock, and Carus in the medical faculty; the philosophers Ahrens and Drobisch, the geographer Peschel, the astronomer Bruhns, the naturalists Kolbe and Leuckart, the historians Wuttke and Voigt, the philologists Ritschl, Curtius, and Lange, and the orientalists Ebers, Brockhaus, and Fleischer. The university building has been greatly enlarged; a third chemical laboratory was established in 1867, a physiological laboratory in 1869, and a pathological laboratory in 1871. A new building for the physical institute was begun in 1872, and another for the anatomical institute in 1873. The budget for 1872 appropriated for the university 169,000 thalers. Besides this university, Leipsic has an agricultural institute, two gymnasia, a *Realschule*, one of the largest commercial schools of Germany, an industrial school, institutions for the deaf and dumb and the blind, and a number of other schools. It possesses also a town library with a remarkable collection of oriental manuscripts and Turkish works, and a considerable number of societies and journals for the promotion of science, letters, and art. A conservatory of music was founded by Mendelssohn-Bartholdy in 1843, and a professorship of music was es-

tablished in the university in 1860. Few towns are more devoted to the cultivation of music and the drama. Since 1871 Leipsic has been the seat of the supreme commercial court of the German empire.—The three annual commercial fairs of Leipsic are the most important in Europe, and are attended by persons of almost all nations, but chiefly by Germans and merchants from Poland, Russia, and other Slavic countries. The number of visitors is usually about 60,000, and the transactions amount to about \$50,000,000 annually. Notwithstanding the commercial magnitude of its fairs, Leipsic is still more extensively known by the book trade of which it is the centre. In 1871 there were in the city 249 publishers and booksellers. The principal publishing houses are those of Brockhaus and B. Tauchnitz. The number of printing offices was 50, and of bookbinding establishments 180. Five principal railways have their depots at Leipsic, and a number of less important lines branch off from here. Among the chief manufactures are tobacco, cigars, and pianos.—Leipsic is first mentioned as a town in the beginning of the 11th century, and its commercial importance began as early as the 13th. It suffered much during the thirty years' war, and the great victory of Gustavus Adolphus over Tilly, Sept. 7, 1631, was gained in its vicinity at Breitenfeld. On Oct. 16–19, 1813, was fought the memorable battle of Leipsic, called by the Germans the great *Völkerschlacht*, which precipitated the downfall of Napoleon, already weakened in his resources by the disasters of the Russian campaign. On the 16th the main army of the allied troops of Russia, Prussia, and Austria, about 160,000 strong, under Prince Schwarzenberg, attacked the French stationed in and around Leipsic, and from 9 o'clock in the morning until noon a series of villages on the south of the city occupied by the French were furiously but unsuccessfully assaulted. Napoleon, assuming the offensive, then adopted his favorite measure of a grand attack on the enemy's centre, and a powerful column of the old and young guards, preceded by a train of artillery, pierced the allied army. Schwarzenberg ordered up his reserves, and Napoleon doing the same, a general engagement ensued along the whole line of attack, distinguished by frequent charges of immense bodies of cavalry. At one time Murat at the head of the cuirassiers of the old guard nearly succeeded in capturing the emperor of Russia and the king of Prussia; but the Cossacks of the imperial guard and the Austrian reserves coming up to the front at all points, the French were checked, and at nightfall both armies remained nearly in the position they had occupied in the morning. The only decided success of the French was on the western side of Leipsic, where Bertrand drove back the Austrians under Gyulai, and preserved a line of retreat through Lindenau in case of disaster. During the engagement between the main armies Blücher arrived from Halle with the army of Silesia, about

60,000 strong, and after an obstinate conflict drove Marmont out of the village of Möckern. On the 17th, a Sunday, both armies by tacit agreement rested, and Napoleon, conscious of his weakness, made an ineffectual attempt to procure an armistice. The 18th found his forces, about 160,000 in number, arranged in a semi-circle around the north, east, and south of the city; while to oppose him Schwarzenberg, strengthened by the arrival of the Russian reserves under Benningsen and Bernadotte's army of the north, brought into the field 300,000 men and nearly 1,400 cannon. Against these odds the French fought with heroic courage, and their artillery, amounting to 800 pieces, was played with a rapidity and effect which for a long time kept their assailants in check. Gradually their circle of defence was narrowed, and at a critical period of the day they were weakened by the defection of large bodies of Saxon and Württemberg troops, who immediately turned their guns against their former comrades. The allies having at length penetrated into the suburb of Schönfeld, Napoleon became convinced that the city was no longer tenable, and, taking advantage of a cessation of hostilities at nightfall, commenced a retreat. Amid a scene of fearful confusion the French filed off through Lindenau. Early on the morning of the 19th the allies forced an entrance into the city, and a terrible conflict ensued with the French rear guard, who were encumbered with immense trains of baggage and artillery and crowds of wounded. In the height of the mêlée the bridge of Lindenau, the only outlet of retreat over the river Elster, was prematurely blown up, leaving 12,000 soldiers, besides 25,000 sick and wounded, in the hands of the allies. Marshal Macdonald by great exertion succeeded in swimming his horse across the river, but Prince Poniatowski in attempting the passage was drowned. The total loss of the French during the three days of fighting was more than 60,000; that of the allies 50,000. At 2 P. M. on the 19th the carnage ceased, and Napoleon was in full retreat toward the Rhine.

**LEISLER, Jacob**, an American adventurer, born in Frankfort, Germany, executed in New York, May 16, 1691. He came to America in 1660 as a soldier in the service of the Dutch West India company. Leaving the army soon after his arrival, he engaged in the Indian trade, and became a comparatively wealthy man. In 1674 he was appointed a commissioner of the forced loan imposed by Colve. While on a voyage to Europe in 1678 he was captured by Moorish pirates, and was compelled to pay a ransom of 2,050 pieces of eight to obtain his freedom. Previous to this voyage he was a resident of Albany, and had been involved in the ecclesiastical difficulties of that city in 1676, in which he suffered both in character and purse, having been mulcted in the entire cost of the litigation which was instituted by him and Jacob Milborne, who after-

ward became his son-in-law as well as his secretary and fellow sufferer. Under Dongan's administration in 1683 he was appointed one of the judges, or "commissioners" as they were styled, of the court of admiralty in New York. In 1683 Gov. Dongan was succeeded by Lieut. Gov. Francis Nicholson, who was in command of the colony when Jacob Leisler, supported by the mass of the lower orders of the inhabitants, seized the fort and the public funds on the last of May, 1689, for "the preservation of the Protestant religion." On June 2 Leisler with his own train band of 49 men took possession of the fort, and resolved, as he expressed it himself, not to leave until he had brought all the train bands fully to join with him. On the next day he declared for the prince of Orange. A committee of safety was then formed, who on June 8 commissioned Leisler as "captain of the fort." In this capacity he at once began to repair the fort, and strengthened it with a "battery" of six guns beyond its walls, which was the origin of that public park still known as the Battery. Nicholson and the council of the province, with the authorities of the city, headed by Stephanus van Cortlandt the mayor, attempted by pacific means to prevent the uprising, but without effect. Becoming finally alarmed for their own safety, the lieutenant governor sailed for England, and the mayor with the other officials retired to Albany. On Aug. 16 the committee of safety appointed Leisler "commander-in-chief of the province," with the full power of a governor in all matters civil and military. He now attempted to reduce Albany and the northern parts of the colony, which from the first had refused to recognize his authority, although that city, as well as the whole province, had acknowledged William and Mary immediately on the arrival of the news of the great revolution in England. Milborne was sent in November with an armed force to Albany, to assist in its defence against some Indian hostilities which were threatened, but directed by Leisler to withhold it unless his own authority was recognized. This was refused, and Milborne returned unsuccessful. In December arrived a despatch from William and Mary directed "to Francis Nicholson, Esq., or in his absence to such as for the time being takes care for preserving the peace and administering the laws in his majesty's province of New York." This Leisler construed as an appointment of himself as the king's lieutenant governor. He therefore dissolved the committee of safety, swore in a council, and assumed the style of a royal lieutenant governor and commander-in-chief. After the massacre at Schenectady in February, 1690, he engaged with great vigor in the expeditions against the French, and equipped and despatched against Quebec the first fleet of men-of-war sent forth from the port of New York. A few months later Major Ingoldesby arrived with the news of Sloughter's appointment as governor, and demanded possession of

the fort, which Leisler refused. On Slougher's own demand immediately upon his arrival in March, 1691, he likewise refused to surrender it, until he was convinced of Slougher's identity, and the latter had sworn in his council. Leisler was immediately imprisoned, charged with treason and murder, and shortly after tried and condemned to death. His son-in-law and secretary Milborne was also condemned on the same charges. These trials were manifestly unjust; the judges were the personal and political enemies of the prisoners, and so gross were the acts of some of the parties that Slougher hesitated at signing the death warrants, and it is said that he finally did so when under the influence of wine. By the English law of treason their estates were forfeited to the crown, but the committee of the privy council to whom the matter was referred reported that although the trial was in conformity to the forms of law, they nevertheless recommended the restoration of the estates of the culprits to their heirs. In 1695 Leisler's son succeeded in procuring the passage of an act of parliament reversing his father's attainder. In 1698 the earl of Bellamont, who had been one of the most influential supporters of the efforts of Leisler's son, was appointed governor of New York, and through his influence the assembly voted an indemnity to Leisler's heirs. The bones of Leisler and Milborne were taken up and honorably interred in the Dutch church.

**LEITH**, a seaport town of Edinburghshire, Scotland, situated on the Water of Leith at its confluence with the frith of Forth, almost adjoining Edinburgh; pop. in 1871, 44,280. Until the passing of the burgh reform act of 1833, it was dependent upon and governed by the city of Edinburgh, of which it forms the port. It has a Latin school, a mechanics' hall, several hospitals, and a public library. Among its numerous manufactures are sail cloth, glass ware, soap, paints, and chemicals. The town is built on the low ground adjoining the frith. The more ancient streets and lanes are narrow and tortuous, but those of the modern part of the town are commodious and well built. The harbor, originally a difficult one, on account of the sands brought down by the river accumulating within it, is now one of the most commodious on the E. coast; and its piers, docks, and other works which have been constructed within the present century afford excellent accommodation for shipping. A large portion of the trade of this port is with the Hanse towns, Holland, Denmark, and the Russian Baltic ports. The coastwise entrances during the year ending Sept. 30, 1871, were 2,878, tonnage 292,354; the clearances 3,445, tonnage 382,199. The entrances from the colonies and foreign countries were 1,444, tonnage 423,211; the clearances to the same 882, tonnage 335,789. Of the entrances 1,504, tonnage 435,128, and of the clearances 1,310, tonnage 388,555, were foreign vessels. The customs revenue for the same period amounted to £164,245.

**LEITHA** (Hun. *Lajta*), a river of Austria, an affluent of the Danube. It rises at Haderswerth, in Lower Austria, constitutes for some distance the boundary between the two divisions of the Austro-Hungarian monarchy, which on that account are designated as Cisleithania and Transleithania (see AUSTRIA), and falls near Altenburg, in Hungary, into a branch of the Danube. On the right bank of the Leitha are the Leitha mountains, 1,600 to 2,400 ft. high.

**LEITMERITZ** (Boh. *Litomeřice*), a town of Bohemia, on the right bank of the Elbe, which is crossed here by a long bridge, 33 m. N. W. of Prague; pop. in 1870, 10,023. It is partly fortified and beautifully situated, and is the capital of a circle which, on account of the extent, fertility, and beauty of its gardens, is called the Bohemian paradise. It contains a magnificent cathedral founded in 1054, 11 other churches, a fine episcopal palace surrounded with walls, a town hall with extensive archives, a theological seminary, a gymnasium, a normal and other schools, several convents, and a nunnery. Straw hats and leather and other articles are manufactured; the shipping business and the fisheries, particularly in salmon, are important; and the trade is active in fruit and also in grain. The best Bohemian wines are produced in this district, and much of the Bohemian glass is polished here.

**LEITOMISCHL** (Boh. *Litomyšl*), a town of Bohemia, on the Laucna, 84 m. E. S. E. of Prague; pop. in 1870, 7,021. It has a palace with a library, picture gallery, and other attractions; a college of the Piarists, with one of the most beautiful churches of Bohemia; a gymnasium and other schools; about 100 distilleries of brandy, and manufactories of linen.

**LEITRIM**, a N. W. county of Ireland, in the province of Connaught, bordering on Donegal bay and the counties Donegal, Fermanagh, Cavan, Longford, Roscommon, and Sligo; area, 613 sq. m.; pop. in 1871, 95,324. Lough Allen divides it into two very nearly equal parts, that lying S. being chiefly an undulating plain, bounded W. by the Shannon, and that lying N. hilly with intermediate valleys traversed by fertilizing streams. Loughs Macnean (4 by 2 m.) and Melvin (8 by 2 m.) separate the N. E. part of the county from Fermanagh, and the river Duff separates it from Sligo. The coast for the most part is a rocky bluff rising above a rough stony beach, and exposed to the whole swell of the Atlantic. It has no port or harbor; there are salmon fisheries at the mouths of the rivers. The principal streams are the Shannon, Rinn, and Bonnet. The surface is diversified, and in the valleys and plains the soil is extremely fertile. Near Lough Allen is an extensive coal formation. Lead, copper, and manganese are found. The climate is raw and damp, but more genial in the south than in the north. The principal crops are potatoes, oats, and hay; the county generally is more adapted to grazing than tillage. The manufactures are linens and woollens for domestic

use, and coarse pottery. The principal towns are Carrick-on-Shannon (the county town), Manor Hamilton, and Mohill.

**LEJEAN, Guillaume**, a French traveller, born at Plouégat-Guérand, Finistère, in 1825, died there, Feb. 1, 1871. He became known in 1847 by a historical work relating to Morlaix, and in 1850 by one upon Brittany. Under the patronage of the government he explored European Turkey in 1857. In 1860-'61 he visited the region of the upper and the White Nile. In 1862 he was appointed consul in Abyssinia, and in 1863 was imprisoned and expelled by Theodoros. Before returning to Paris he explored several districts of northern Abyssinia, and at the end of 1865 he set out again for the East, and reached Cashmere; but not being able to advance to Bokhara, he resumed from 1867 to 1870 his explorations of Turkey. He published *Voyage aux deux Nils* (Paris, 1865).

**LEJEUNE, Henry**, an English painter, of Flemish descent, born in London about 1819. He was admitted as a student at the royal academy in 1834. In 1840 he exhibited his painting of "Joseph interpreting the Dream of Pharaoh's Butler," and in 1841 obtained the gold medal for "Samson bursting his Bonds." In 1845 he became head master of the painting school of the royal academy, and in 1848 curator of the school, which post he resigned in 1864. In 1863 he was elected an associate of the academy. Among his numerous works are: "Samson" and "Una and the Lion" (1842); "Prospero and Miranda" (1844); "Ruth and Boaz" (1845); "Bassanio choosing the Casket" and "The Liberation of the Slaves" (1847); "Pan teaching Apollo" (1848); "Ophelia" and "Lear and Cordelia" (1849); "The Sermon on the Mount" (1851); "What shall I do to inherit Eternal Life?" (1852); "Infant Prayer" (1853); "Christ blessing Little Children" (1855); "Mary Magdalen at the Sepulchre" (1856); "The Vision of Queen Catharine" (1857); "The early Days of Timothy" and "Children gathering Water Lilies" (1858).

**LEJEUNE, Louis François**, a French general and painter, born in Strasburg in 1775, died in Toulouse in 1848. He enlisted in the army in 1792, and was placed in 1799 on the staff of Berthier, minister of war. His valor at Marengo and Austerlitz won for him successive promotions. In 1809, after the battle of Essling, he crossed in a boat, at the risk of his life, to the island of Lobau, where Napoleon was shut up, and brought back orders to Bessières and Masséna which decided the victory of Wagram. After the battle of Borodino he became brigadier general, and subsequently distinguished himself at Lützen and Bautzen. Under the restoration he was attached to the general staff, and after the overthrow of Charles X. he went to Toulouse as director of the school of fine arts and of industry. His painting of the battle of Marengo was pur-

chased in 1801 by the government, and he subsequently painted the battles of Aboukir, Mount Tabor, Lodi, the Pyramids, Borodino, and others. In the latter part of his life he confined himself to landscape painting.

**LE JEUNE, Paul**, a French missionary, born in 1592, died in Paris, Aug. 7, 1664. He entered the society of Jesus, and acquired reputation as a director. He was rector of the college of Dieppe before he went to Canada, in 1632, as first superior of the Jesuit missions after the country was restored to France. He remained in office till 1639, and was editor of some of the Jesuit "Relations." After his return to France he became procurator of the foreign missions. He wrote a "Ten Days' Retreat" and other pious works.

**LEKAIN, Henri Louis Cain**, a French tragedian, born in Paris, April 14, 1728, died Feb. 8, 1778. He was the son of a goldsmith, and after studying at the Mazarin college, where he imbibed a taste for the dramatic art, he was placed at his father's trade. His performance as a member of a private dramatic association attracted the notice of Voltaire, who procured for him permission to appear on the stage at the Théâtre Français, where he met with bitter opposition. He persevered, corrected his faults, and after 17 months obtained a regular engagement. His fame has scarcely been equalled by that of Talma or Rachel. He was peculiarly great in most of Voltaire's tragedies. His *Mémoires* were published by his son in 1801, and reprinted at Paris in 1825 under the supervision of Talma.

**LELAND, Charles Godfrey**, an American author, born in Philadelphia, Aug. 15, 1824. He graduated at Princeton college in 1846, and subsequently studied at the universities of Heidelberg, Munich, and Paris, devoting himself more particularly to the modern languages, aesthetics, history, and philosophy. He was residing in the last named city during the revolutionary outbreak in February, 1848, and was one of the American deputation sent to congratulate the provisional government. He returned to Philadelphia in the same year, studied law, and was admitted to the bar; but he soon relinquished that profession for the pursuit of literature. He was connected as editor or contributor with several American periodicals, but for some years has resided chiefly in Europe. His works, some of which are of a humorous or burlesque character, are as follows: "The Poetry and Mystery of Dreams" (Philadelphia, 1855); "Meister Karl's Sketch Book" (1855); "Pictures of Travel," a translation of Heine's *Reisebilder* (1856); "Sunshine in Thought" (New York, 1862); "Legends of Birds," illustrated (Philadelphia, 1864); "Hans Breitmann's Ballads" (5 parts, 1867 *et seq.*; complete ed., 1870); "The Music Lessons of Confucius and other Poems" (London, 1871); a translation of the humorous poems of Scheffel (1871); "Egyptian Sketch Book;" and "The English Gipsies and their Language" (1873).

**LELAND, John**, an English Presbyterian divine, born in Wigan, Lancashire, in 1691, died in Dublin, Jan. 16, 1766. He passed his life as pastor of a Presbyterian congregation in Dublin, and received the degree of D. D. from the university of Aberdeen. Though engaged through life in polemical warfare, he was remarkable for charity and candor. His principal works are: "The Divine Authority of the Old and New Testament" (2 vols. 8vo, 1739-'40); "View of the Principal Deistical Writers that have appeared in England in the Past and Present Century" (1754); and "The Advantage and Necessity of the Christian Revelation" (2 vols. 4to, 1764).

**LELAND, John**, an American clergyman, born in Grafton, Mass., May 14, 1754, died in North Adams, Mass., Jan. 14, 1841. He was licensed as a Baptist preacher in 1774, and in 1775 removed to Virginia, where until 1791, with the exception of occasional visits to the north, he was actively employed in discharging the duties of his office. In February, 1792, he settled in Cheshire, in western Massachusetts, where he resided for the most part until his death. He was a prolific writer, and during his long ministry preached many thousand sermons, and baptized more persons probably than any one of his contemporaries. His occasional sermons, addresses, and essays, together with his autobiography and additional notices of his life by Miss L. F. Green, were published in 1845 (1 vol. 8vo). He was a man of much eccentricity and shrewdness, and throughout his life took the warmest interest in politics. Toward the close of 1801 he went to Washington to present to Mr. Jefferson a mammoth cheese weighing 1,450 lbs., as a testimonial of the esteem and confidence of the people of Cheshire in the new chief magistrate. He was firmly attached to the democratic party, and sometimes manifested his predilections in his pulpit discourses.

**LELEGES**, an ancient people, who appear in the early traditions of the W. coast of Asia Minor, of the islands of the Ægean sea, and of various countries of Hellas and Peloponnesus, but whose history is involved in great obscurity. They are mentioned in Homer as the allies of the Trojans; Herodotus identifies them with the Carians; and Pausanias regards them as a part of the latter people. They seem to have been of Pelasgian race, and to have become connected with the Carians after an emigration from the continent of Greece to the islands, whence they followed them to Asia Minor.

**LELEWEL, Joachim**, a Polish historian, born in Warsaw, March 20, 1786, died in Brussels, May 29, 1861. He studied history at Wilna, and was appointed professor of history at Kremenetz in Volhynia, and afterward at the university of Wilna. He rose to the first rank among Polish historians, but in 1822 was removed for his revolutionary language. Having returned to Warsaw, he was in 1830 elected to the diet, and was a member of the various revolutionary governments which succeeded

each other before the events of Aug. 15, 1831. After the fall of Warsaw he went to Paris, where he was placed at the head of a Polish democratic committee, and became involved in controversies with Czartoryski, Bem, and other refugees belonging to the aristocratic party. The committee was dissolved, Lelewel removed from Paris by order of the government of Louis Philippe, and finally, after the failure of several Polish conspiracies in various countries, he was banished from France. He took up his residence at Brussels, where he lectured on history at the new university, and lived a life of self-imposed poverty and incessant literary labors. Among his numerous works, in Polish, French, and German, are: a "History of Poland" for the young (Warsaw, 1829); "Treatises on Geographical and Historical Subjects" (Leipsic, 1836); "Numismatics of the Middle Ages" (Paris, 1836); "Numismatical Studies" (Brussels, 1840); "Poland Regenerated" (Brussels, 1843); "Poland in the Middle Ages" (Posen, 1846-'51); "Geography of the Arabs" (Paris, 1851); and "Geography of the Middle Ages," with an atlas engraved by himself (4 vols., Brussels, 1852-'7).

**LELEUX, Adolphe**, a French painter, born in Paris, Nov. 15, 1812. He early exhibited landscapes and genre pictures representing the scenery and life of Brittany, and subsequently excelled in delineating incidents of the revolution of 1848. In his latest pictures he has resumed his sketches of Brittany.—His brother **ARMAND**, born in 1818, excels in the same sphere of art; but the scenes of several of his pictures are laid in Switzerland and Italy. The wife of the latter, **ÉMILIE GIRAUD**, born in Geneva in 1834, excels as a genre painter. Among her later works are "The Marriage Contract" (1866), "A Supper of Actors" (1868), and "The Singing Teacher" (1869).

**LELY, Sir Peter**, an English painter, born in Soest, Westphalia, in 1617, died in England in 1680. His family name was originally Van Der Faes, but his father assumed the name of Lely. He was instructed in painting by Peter Greber of Haarlem, and at 20 years of age had acquired reputation by his landscapes and portraits. Visiting England in 1641, he determined to follow the example of Vandyke, and thenceforth devoted himself almost exclusively to portrait painting, in which he soon surpassed all his contemporaries. The prince of Orange introduced him in 1643 to the notice of Charles I., who sat to him for his portrait. During the commonwealth he remained in England, and is said to have painted the portrait of Cromwell, who warned him that unless he made a true likeness, with all the roughnesses, pimples, and warts as he saw them, he should not receive a farthing for the picture. At the restoration he became court painter to Charles II., who made him a knight, and he acquired wealth. He excelled in female portraits, and painted a celebrated series of the "Beauties of the Court of Charles II.," preserved at Hamp-

ton Court. The landscapes in his pieces were generally executed by other hands. He occasionally painted historical pictures, of which the best known is "Susannah and the Elders," at Bursleigh house.

**LEMAIRE, Nicolas Éloi**, a French scholar, born at Triancourt, Champagne, Dec. 1, 1767, died Oct. 3, 1832. He completed his studies in the college of Ste. Barbe in Paris, and became professor of rhetoric in 1790. Embracing extreme revolutionary opinions, he was a deputy judge in 1793. Under the consulate he travelled in Italy, and delivered Latin improvisations in several cities. He obtained in 1811 the chair of Latin poetry at the collège de France. Under the restoration he began the *Bibliotheca Classica Latina* (154 vols., Paris, 1818 *et seq.*), which he left unfinished at his death. It embraces 18 poets and 16 prose writers. He is the author also of several original Latin poems.

**LEMAIRE, Philippe Henri**, a French sculptor, born in Valenciennes in 1798. He studied in Paris and Rome, and exhibited in 1827 a statue of a young girl holding a butterfly, which was purchased by the duchess of Berry. Several of his subsequent works were placed in the Tuileries, the Luxembourg, and Versailles. For his colossal group in front of the Madeleine, representing "Christ pardoning Mary Magdalen," he was made an officer of the legion of honor in 1843, and a member of the academy in 1845. Among his later works are statues of Henry IV. for the hôtel de ville, of Hoche at Versailles, of Napoleon at the exchange of Lille, and of Froissart at Valenciennes.

**LEMATRE, Frédéric**, a French actor, born in Havre about 1800. At an early age he prepared himself for the stage. In 1822 he failed in a competition for prizes offered to the pupils of the conservatory, only a single vote being recorded in his favor, but that was given by Talma. In 1823 he made his début at the Ambigu Comique, but his reputation was not firmly established till 1834 by his personation of Robert Macaire, at the Folies Dramatiques, in the play of that name, of which he was one of the authors. His rendering of Alexandre Dumas's *Kean*, and particularly of Victor Hugo's *Ruy Blas* (1836), and of Balzac's *Vautrin* (1840) added to his fame, although not even his acting could save the latter play from being withdrawn on account of its reflections upon Louis Philippe. In 1842 he played for some time at the Théâtre Français, but his genius was not suited to those classic boards. He subsequently performed alternately at the Porte St. Martin, the Gaité, the Variétés, the Odéon, and the Ambigu Comique, where he was so successful in amusing the audiences in his comic and moving them in his tragic parts, that he was often called the Talma of the boulevards. Among his most popular performances, besides Robert Macaire, were Don César de Bazan and Toussaint l'Ouverture. He won great applause in *Le vieux caporal* (1853), *Henri III.* (1856), and *Le maître d'école* (1859).

He afterward retired from the stage for some years; but in October, 1873, he again made his appearance, playing the part of the nameless Jew in Victor Hugo's *Marie Tudor*.

**LEMAN, Lake.** See GENEVA, LAKE OF.

**LE MANS.** See MANS.

**LEMBERG, or Leopold** (Pol. *Lwów*), the capital of Austrian Galicia, on the Peltew, a small tributary of the Bug, 185 m. E. of Cracow; pop. in 1870, 87,105, nearly one third of whom were Jews. The city proper is small, but the suburbs are extensive and contain many handsome houses; and the lofty towers of the cathedral and numerous other churches, as well as the massiveness of other public edifices, give to the city an imposing appearance. The university of Lemberg, founded in 1784, had in 1872 46 professors and 1,031 students (554 Poles, 430 Ruthenians, 47 Germans). The university library in 1873 had 53,000 volumes. The city possesses also an institute, established by Ossolinski, rich in Slavic antiquities and in ancient Polish literature. Among the most noteworthy buildings are the city hall, the Count Skarbek theatre, the diet hall, the palace of the Catholic archbishop, and several convents, hospitals, and railroad depots. It is the seat of the governor of Galicia, of Roman Catholic, United Greek, and United Armenian archbishops, and of a Protestant superintendent general. Some manufactures, mainly of cloth and linen, are carried on; but it is chiefly as a commercial town, with large annual fairs, and as one of the principal corn markets of Austria, that Lemberg is important. Railway lines connect it with Cracow, Pesth, Czernowitz, and other cities. Lemberg was founded in the 13th century, taken by Casimir I. of Poland in 1340, besieged in 1648 by the revolted Cossacks under Chmielnicki, who withdrew on receiving a large ransom, and captured by the Turks in 1672, when it ceased to be of importance as a fortress. After having been more than four centuries in the possession of Poland, it came to Austria at the first partition of that country in 1772. It was bombarded by the Austrians during the outbreak of Nov. 2, 1848.

**LEMERY, Nicolas**, a French chemist, born in Rouen, Nov. 17, 1645, died in Paris, June 19, 1715. His chemical lectures in Montpellier, and subsequently in Paris, were very popular. He stripped the science of most of the prevailing charlatanry, and Fontenelle and Voltaire expressed the highest regard for his attainments. His *Cours de chimie* (Paris, 1675) passed through more than 30 editions, the best being by Baron (1756), was translated into many languages, and was the highest authority for nearly a century. On account of Lémery being a Protestant, he was deprived of his license in 1681, and after declining an offer from the elector of Brandenburg to teach chemistry in Berlin, he went to England in 1683, and was favorably received by Charles II., but soon resumed his practice in Paris. The revolution

of the edict of Nantes threatening to deprive him of all means of subsistence, he united with the Catholic church in 1686. In 1699 he was admitted to the academy of sciences as associate member, and afterward as pensioner. His principal works, besides his lectures on chemistry, are: *Pharmacopée universelle* (Paris, 1697; 8th ed., 1763); *Traité universel des drogues simples* (1698, and several later editions); and *Nouveau recueil des secrets et curiosités les plus rares* (2 vols., Amsterdam, 1709).—His son Louis (1677–1743) excelled as a physician and writer, as also his son Jacques, known as Lémery jeune (1678–1721).

**LEMHI**, an E. county of Idaho, separated on the E. from Montana by the Rocky mountains; area, 2,000 sq. m.; pop. in 1870, 988, of whom 120 were Chinese. It is drained by the E. fork of Salmon river and by Rock creek. In 1870 there were 1 quartz and 7 placer gold mines. Capital, Salmon City.

**LEMMING**, a small rodent of the subfamily arvicolinæ or field mice, and the genus *myodes* (Pallas); authors have also referred it to *georychus* (Ill.), *lemmus* (Zinck), and *hypudæus* (Ill.). The lemmings may be distinguished from the arvicolas by the hairy soles, very short tail, long sickle-shaped claws for digging, and small size or absence of external ears; the last lower molar has four or five triangular prisms alternating with each other. The species are confined to the arctic regions of both hemispheres, and are the most northern form of rodent known; of the North American species none have been found within the United States; they live in the thick mosses and sphagnum swamps in the vicinity of the arctic circle. The Norway lemming (*M. lemmus*, Pall.) has a stout body 5 in. long, a short and broad head, short and robust legs, and coarse

dentition consists of incisors  $\frac{1}{1}$ , molars  $\frac{3}{3}$ ; the skull is massive and broad, the orbits very large, the temporal fossæ small, and the zygoma high; the incisors are thick, large, and much rounded anteriorly. The color above is yellowish and reddish with black markings, and yellowish white below. Its natural habitat is the mountainous regions of Lapland and Norway, from which it descends at irregular intervals in immense troops, which devour every green thing in their course, and commit as great devastations as the migratory locusts; it has been supposed that an unusual multiplication of these animals and an actual or anticipated scarcity of food impel them to these migrations. They move chiefly by night or early in the morning, proceeding obstinately in a direct line, swimming rivers, crossing mountains, and permitting nothing but an absolutely insurmountable obstacle to alter their straight course; many are destroyed by fire and water, by each other, and by rapacious beasts and birds. They are not disposed to live in society, but dwell in a scattered manner in holes in the ground; they lay up no regular provision for the winter's use; they produce five or six young at a time, and it is said several times in a year; the flesh, which tastes like that of the squirrel, is eaten in Lapland. The food consists of plants, seeds, roots, and any vegetable matter that comes in their way.

—The best known American species is the Hudson bay lemming (*M. torquatus*, Keys. and Blas., or *M. Hudsonius*, Wagner), a circumpolar animal, coming down as far as Labrador and more southward on the Pacific coast. There are no external ears, and the two middle claws of the fore feet are remarkably large; the color above is a mixed reddish brown and pale yellow, palest on the sides, beneath whitish, whiskers black, and sometimes with a whitish collar edged with brown on both sides; the color is white in winter, with a few black hairs interspersed. The length is about  $5\frac{1}{2}$  in.; the thumb is rudimentary on the fore feet, and the two middle toes appear to have double nails, as the callous end projects under the nail. It is an inoffensive animal, living in burrows in the ground or under stones, feeding on roots and similar substances. —For details on the lemmings, see Sir John Richardson's *Fauna Boreali-Americana*.

**LEMNOS** (now *Stalimni*, *Stalimene*, or *Limni*), a Turkish island in the Grecian archipelago, situated about 40 m. W. S. W. of the Dardanelles, in lat. 40° N., lon. 25° E.; length 22 m., greatest breadth 20 m.; area, 195 sq. m.; pop. 10,000. Lemnos may be said to have been formed by the union of two peninsulas, the bay of Paradiso N. and that of Sant' Antonio S. almost dividing it into two parts. The surface is in general hilly, and the soil light. A considerable portion of the islanders are engaged in fishing. The capital, Castro or Limni (anc. *Myrina*), stands on the W. coast, and is the residence of a Greek bishop and of the Turkish governor.

Lemming (*Myodes lemmus*).

bristly hair; the whiskers are in five horizontal series; the fore feet are provided with very long, stout, and fossorial claws, the third the longest, and the thumb rudimentary; the hind feet short and broad, well armed with claws; the short tail is densely coated with hair. The

According to Pliny, Lemnos once contained a labyrinth sustained by 150 columns, and the gates of which could be opened by a child. This island has been famous from remote antiquity for a species of earth termed *terra Lemnia*, thought by the ancients to possess extraordinary medicinal virtues. In antiquity Lemnos was sacred to Vulcan, whose workshop is placed there by some of the poets. The most ancient inhabitants are said to have been Thracians, who were succeeded by the fabulous Minyæ, and subsequently by Pelasgians. It was conquered by Darius, but delivered by Miltiades, and made an Athenian dependency.

**LEMOINE.** See *LE MOYNE*.

**LEMOINE, Gustave,** a French dramatist, born in Paris, Oct. 29, 1786. He succeeded his father as a music dealer, and published several works for the piano, and in 1836 the libretto of the comic opera *Le mauvais œil*, and many ballads, which were set to music by Mme. Loïsa Puget, whom he married. He is the author of several dramas, the most popular being *La grâce de Dieu* (1841), which has been performed more than 500 times at the Gaité theatre, and which became the text of Donizetti's *Linda di Chamounix*. An operetta by his wife, *La veilleuse*, was given in 1869.

**LEMOINE, John Emile,** a French journalist, born in London, of French parents, in 1814. He completed his studies in Paris, and became one of the editors of the *Journal des Débats*. It was mainly due to his influence that this journal opposed the royalist schemes in 1872, which led to the secession of St. Marc Girardin and other editors from that journal. Thiers appointed Lemoine librarian of the palace of Fontainebleau. He is one of the regular writers for the *Revue des Deux Mondes*, and the author of many works relating to England, Ireland, and the East, chiefly in connection with British and Russian conflicts. Among his other writings are: *La vie de Brummel* (1844); *La cour de Berlin*, *La cour de Saint-Petersbourg*, and *Caroline de Brunswick* (1846). In 1862 he collected a number of his biographical and critical essays under the title of *Études biographiques et critiques*.

**LEMON** (*citrus limonium*). The species of the genus *citrus* are not very clearly defined, and some botanists have regarded the citron, orange, shaddock, lime, and lemon, usually considered distinct, as forms derived from one species, the citron (*C. medica*); but whatever may be the difficulties presented to the botanist, horticulturally and commercially they are sufficiently distinct in the form and sensible properties of their fruit. The lemon grows wild in the north of India, and has long been in cultivation among the Arabs, who introduced it in various parts of Asia and Africa; its introduction into Europe is accredited to the crusaders, but the precise date is unknown; it is now naturalized in the West Indies and other parts of America. The botanical characters of the genus will be given under *ORANGE*,

from which the lemon differs in but few particulars except the fruit; the petiole of the orange leaf has a broad wing upon each side, while in the lemon this is very small or wanting; the flowers, usually smaller than those of the orange, have the exterior tinged with purple; the usually elongated fruit has a projection or nipple at the end opposite the stem. The oil, with which the rind abounds, has a different odor from that of the orange, and the juice, rich in citric acid, is intensely sour; to this, however, the variety known as the sweet lemon is an exception. The lemon succeeds in the same climates as the orange, and the culture of the two is the same. Over 30 varieties are enumerated, some of which, as the horned and the fingered lemons, are only known in the collections of amateurs as curious monstrosities. Those in cultivation for profit differ in size, shape, thickness, and roughness of skin, and the size and form of the nipple at the end. In a horticultural classification they are grouped as round, pear-shaped, cylindrical, gourd-shaped, wax, &c., with several varieties under each head; in commerce they are known by the names of the ports from which they are shipped, as Messina, Lisbon, &c. Very fine lemons are produced in Florida and in the southern part of California, but much less attention has been given to their cultivation than to that of the orange; as the orange is more difficult to transport than the lemon, it always brings a higher price, and the growers find it more profitable. The lemon tree is frequently cultivated in conservatories, and is a favorite as a house plant, as it is ornamental in its foliage, flower, and fruit; if not exposed to too low a temperature, the tree will survive a great deal of bad treatment, and those seen in house culture are usually in a poor condition. The tree should have a good open soil, and when not in a growing state during the winter needs but little water; new growth begins late in winter or early in spring, when it should be watered freely, and when the young wood has hardened the plant set out of doors where it will be sheltered from violent winds. The fruit, which sets in spring, remains upon the tree all winter, gradually coloring. The foliage must be washed occasionally to remove dust, and a smutty fungus which sometimes appears; and if a scale insect is found, it must be removed by the use of strong solution of soap applied with a stiff brush. The lemon is valued for its acid juice and its aromatic rind, and its domestic uses in making cooling drinks and for flavoring are well known. The juice contains nearly two per cent. of citric acid with mucilage and bitter extractive matter. (See *CITRIC ACID*.)—The oil of lemons is contained in receptacles in the outer portion of the rind; it is a volatile oil, and was formerly obtained by distillation, but the oil prepared in this manner has a less pleasant flavor than that by expression. The outer portion of the rind, or flavedo as it is

called, is removed by rasping and afterward subjected to pressure; after resting to deposit its coarse impurities, it is filtered and put into copper cans of about six gallons capacity, in which it is exported; the supply comes from the south of Europe. This oil has the same composition ( $C_{10}H_{16}$ ) as the oil of turpentine, and when kept for a long while it loses its proper flavor and has that of turpentine. The oil is largely used by confectioners and pastry cooks for flavoring; the extract of lemon sold for domestic use is a more or less concentrated solution of the oil in alcohol; when mixed with alcohol the oil retains its purity of flavor much longer than when kept by itself, and perfumers preserve this and other essential oils from deterioration by mixing them with alcohol as soon as received.

**LEMON, Mark**, an English journalist and author, born in London, Nov. 30, 1809, died at Crawley, Sussex, May 23, 1870. He was educated at a grammar school, and wrote for the press at an early age. He afterward wrote for the stage, and sometimes appeared as an amateur actor. Upon the establishment of the comic periodical "Punch," in 1841, he became its assistant editor, and from 1843 till his death he was its chief editor. He also contributed largely to other periodicals, and, either singly or in conjunction with others, produced some scores of plays, farces, and melodramas, the best known of which is "The Serious Family." His principal published works are: "The Enchanted Doll" (1849); "A Christmas Hamper, a Collection of Stories in Prose and Verse" (1859); "Wait for the End" (1863); "Legends of Number Nip," and "Loved at Last" (1864); "Falkner Lyle: Story of Two Wives," and "Leighton Hall" (1866).

**LEMON GRASS.** Under the name of oil of lemon grass there is imported from Ceylon and other parts of the East an oil much used in perfumery. The source of this oil is according to some authorities *andropogon schenanthus*, and according to others *A. citratum*. A very similar oil is imported from the same localities as the oil of citronelle; it is said by some that these oils differ only in name, and by others that they are distinct and furnished by different species of *andropogon*. *Andropogon* is a large genus among grasses, nearly 500 species being enumerated; our native representatives of the genus, known as beard grass, have nothing remarkable about them, but several of the tropical species possess decided aromatic properties in their leaves or roots. In India the roots of one species are woven into mats, which at the same time exclude the sun from apartments and give an agreeable perfume to the air as it passes through them. The plant known in our greenhouses as lemon grass is *A. schenanthus*; it has leaves which in appearance are not distinguishable from those of any other coarse grass, but when bruised they give off a most agreeable odor, almost precisely like that of

the well known sweet-scented or lemon verbena (*Lippia [Aloysia] citriodora*). The oil of lemon grass is used to make the perfume known as extract of verbena, and it is used in combination in other favorite perfumes, including the finer kinds of cologne water. Another species, *A. calamus-aromaticus*, furnishes an oil with a strong rose scent; the roots of another are known to perfumers as *vetiver*; and the pungent roots of another are called ginger grass.

**LE MONNIER, Pierre Charles**, a French astronomer, born in Paris, Nov. 23, 1715, died at Héric, near Bayeux, May 31, 1799. The son of a noted savant, he made astronomical observations at the age of 16, and before he was 21 he was received into the academy of sciences, having already presented to that body an elaborate map of the moon. In 1736 he accompanied Maupertuis to Tornea for the measurement of a degree in Lapland; and on his return, by introducing superior instruments and the methods of Flamsteed, he caused great improvements in practical astronomy. In 1742 the king gave him apartments at the Capuchins, rue St. Honoré, which he occupied till the revolution. In 1748 he went to Scotland to observe the solar eclipse, which was there almost annular, and succeeded in measuring the diameter of the moon on the disk of the sun. The results of his observations are contained in the memoirs of the academy, to nearly every volume of which he furnished one or more papers for more than 50 years. He also produced various independent works on astronomical subjects.

**LE MOYNE**, a Canadian family, several of whose members performed important parts in the history of American colonization. The family arose with CHARLES LE MOYNE, born in Normandy in 1626, died in Montreal, Canada, in 1683. He came to Canada in 1641, and after spending several years with the Hurons, settled at Montreal, where he obtained several land grants. He soon distinguished himself as an Indian fighter in a series of actions with the Iroquois, and was appointed commissary and *procureur du roi*. He was captured by the Iroquois in 1665, and held a prisoner for three months. After serving with distinction in Courcelles's and Tracy's expeditions, he was in 1668 ennobled by Louis XIV., and became seigneur of Longueil. To this the title Châteauguay was added some years after, on his acquiring that fief. He was for a long time captain of Montreal, and was recommended by De la Barre for governor of the city. He had eleven sons, of whom, besides the two most celebrated (see BIENVILLE, and IBERVILLE), the following acquired distinction. **I. Charles**, baron de Longueil, born in Montreal, Dec. 10, 1656, died there, June 8, 1729. He first served in the French army in Flanders, under Marshal d'Humières, and was made a lieutenant in the regulars; returning to Canada, he developed colonization and settled his concessions, building churches and a stone fort at Longueil. He

was wounded in an action against the English under Phips, who attacked Quebec in 1690, and was made governor of Montreal and baron in 1700; became commandant general of the colony; was active in the preparation to receive the English under Walker and Nicholson in 1711; governor of Three Rivers in 1720, and of Montreal again in 1724. He persuaded the Iroquois in 1726, in spite of the opposition of Gov. Burnet of New York, to allow him to rebuild Fort Niagara. **II. Paul**, sieur de Maricourt, born in Montreal, Dec. 15, 1663, died in March, 1704. He distinguished himself under his brother Iberville in Hudson bay and in the defence of Quebec, commanded a corps of the French forces against the Iroquois, and subsequently negotiated peace with them in 1701, and exercised great influence in the nation. **III. Joseph**, sieur de Serigny, born in Montreal, July 22, 1668, died in Rochefort, France, in 1734. In 1694 and 1697 he brought over squadrons to operate against the English on Hudson bay, in concert with his brother Iberville. He was also in command of a squadron that brought out some of the first colonists of Louisiana. He surveyed the coasts of that colony in 1718-'19; took part in the capture of Pensacola from the Spaniards, May 14, 1719, and repulsed them with great gallantry from Dauphin island, Aug. 19; was made captain of a ship of the line in 1720; and in 1723 became governor of Rochefort, which office he held at his death. **IV. Antoine**, sieur de Châteauguay, born in Montreal, July 7, 1683, died in Rochefort, France, March 21, 1747. He entered the royal army, and arrived in Louisiana in 1704 with a body of colonists. He served under Iberville in his last expeditions against the English in 1705-'6, was made commandant of the troops in Louisiana in 1717, and king's lieutenant in the colony and knight of St. Louis in 1718. He took command of Pensacola after aiding with an Indian force to effect its capture from the Spaniards, May 14, 1719, surrendered it to them on Aug. 7, and was prisoner of war till July, 1720. He resumed command at Mobile after the peace, was made governor of Martinique in 1727, returned to France in 1744, and became governor of Isle Royale, or Cape Breton, in 1745.—Besides these, three other brothers attained some prominence. **JACQUES**, sieur de Ste. Hélène, born in April, 1659, served under Iberville on several occasions, and was mortally wounded in the defence against Phips in 1690. **FRANÇOIS**, sieur de Bienville I., born March 10, 1666, was killed in battle with the Iroquois at Repentigny, June 7, 1691. **LOUIS**, sieur de Châteauguay I., born in January, 1676, was actively engaged in the operations at Hudson bay, especially in the capture of Fort Monson; was mortally wounded in the successful assault on Fort Nelson, and died Nov. 4, 1694.—Sauvolle, first colonial governor of Louisiana, who is sometimes spoken of as one of the brothers Le Moyne, was not of this family.

**LEMPA**, a river of San Salvador, and the largest stream of Central America falling into the Pacific. It rises in the lake of Guija, in the N. W. corner of San Salvador, flows nearly due E. through a broad and fertile valley for a distance of nearly 150 m., and then, turning abruptly S., breaks through the volcanic coast range of mountains, and falls into the Pacific in lat. 13° 22' N., lon. 88° 12' W. For a considerable part of its course it is navigable. It drains a wide expanse of country, has numerous large tributaries, and as a consequence is subject to sudden floods, at which times the water rises on the lower portions of the stream from 20 to 35 ft., completely submerging the neighboring country. The mouth of the river, which is broad and open, is obstructed by a bar with only 6 ft. of water; but the *estero* of Jaltepeque approaches to within a league of the river, with which it is connected by a natural channel, navigable by small boats during the rainy season.

**LEMPRIERE, John**, an English scholar, born in Jersey about 1760, died Feb. 1, 1824. He was educated at Westminster school and at Pembroke college, Oxford, where he graduated in 1792. He compiled a *Bibliotheca Classica*, or "Classical Dictionary," first published in 1788 in 8vo, and afterward enlarged to 4to. This was the chief book of reference on ancient mythology, biography, and geography until the appearance (1842-'53) of the dictionaries edited by Dr. William Smith. He also published a "Universal Biography" (4to, London, 1808), and commenced a translation of Herodotus, of which he published one volume in 1792.

**LEMUR**, the name applied to many animals of the order *quadrumana* or monkeys, of the families *galeopithecida* and *lemurida*, all of the old world. The *galeopithecida* have been described under **FLYING LEMUR**. In the true lemurs (or *prosimia*, as they are sometimes called) the upper incisors are four, mostly in pairs, separate from the canines, and the lower four or two; the feet are five-toed, with opposable thumbs on the hind ones, and the fourth finger the longest; the hind feet the longest, with the nail of the second finger incurved, the other nails flat. The name *lemur*, which signifies ghost or spectre, was given to them by Linnaeus from their nocturnal habits. More than 30 species are known, divided into five principal genera, inhabiting chiefly Madagascar, a few living in Africa and the warm regions of Asia and its archipelago. Though classed with the *quadrumana*, they come nearer to the *insectivora* in the two-horned uterus, the permanent separation of the lower jaw at the symphysis, and the openness of the orbits behind. The head is rounded, and the snout so elongated and pointed that they are often called fox-nosed monkeys; the legs are tolerably long, the eyes large and in the front of the head, the ears small, the fur soft, and the tail generally long and bushy. They are very pretty animals, and are gentle and playful in

captivity; a single young one is produced at a birth, which the mother carries about for a long time, concealed in her long hair or coiled round her body, tending it with great care. The largest species is the indri (*Ichanotus brevicaudatus*, Illig.), about the size of a large

Ring-tailed Lemur (*Lemur catta*).

cat, the tail being a mere rudiment; the dental formula is: incisors  $\frac{2}{2}-\frac{2}{2}$ , canines  $\frac{1}{1}-\frac{1}{1}$ , molars  $\frac{6}{6}-\frac{6}{6}=30$ ; the color is black, with white throat, buttocks, and heels; they are tamed by the natives of Madagascar, and being very agile are trained like dogs for the chase.—The genus *lemur* (Linn.) has incisors  $\frac{2}{2}$ , canines  $\frac{1}{1}-\frac{1}{1}$ , and molars  $\frac{6}{6}-\frac{6}{6}=36$ ; the eyes are lateral; the tail long and hairy throughout. The ring-tailed lemur (*L. catta*, Linn.) is one of the most elegant species, of a delicate gray color, ruddy on the back, white below and on the cheeks, and the tail ringed with black and white; it is about 19 in. long, of which the tail is 7; it is a gentle and confiding animal, and received its specific name from its occasionally making a sound like the purring of a cat; a common name is *mococo*. The vari (*L. macaco*, Linn.) is varied by large white and black spots. The red lemur (*L. ruber*, Péron) is of a reddish chestnut color, with head, fore hands, tail, and belly black, and a white spot on the nape, being one of the few animals in which the lower parts are darker colored than the upper; it is easily tamed, gentle, agile, but sleepy during the day; the body is about 13 in. and the tail about 1½ ft. long. The name of mongous is popularly applied to all lemurs of an olive-brown color; the term *maki* is also synonymous with *lemur*, most of the species living in Madagascar. The genus *stenops* (Illig.), comprising the slow lemurs, will be noticed under Lori, the common name.—The African lemurs or galagos (*otolicnus*, Illig.) have the nails and teeth of the preceding genus, but the tarsi are elongated, the ears large and naked, the eyes large, and the tail long and tufted; they are insectivorous and frugivorous, nocturnal, and as agile as monkeys or squirrels, making great jumps; when sleeping they are said to close

the ears like bats; the flesh is eaten by the natives of Senegal. The *O. galago* (Wagn.) is about 7 in. long, and the tail about 9; it is of a grayish color, pale yellow on the legs, and the tail brown. The dwarf lemur (*O. [microcebus] pusillus*, Geoffr.), with more hairy ears; facial whiskers, and broader upper incisors, sometimes called the Madagascar rat, is 10 or 11 in. long and 6 in. high; the color is grayish fawn above and white below. In the genus *tarsius* (Storr) there are only two lower incisors, and the molars have several acute tubercles like the insectivora; the eyes are very large, the ears ample and somewhat naked, the tarsi much elongated, and the tail much longer than the body and tufted at the tip. The spectral lemur (*T. spectrum*, Geoffr.) is of a grayish brown color, living in the forests of the Indian archipelago, its long tarsi enabling

Spectral Lemur (*Tarsius spectrum*).

it to leap like a frog; the size is small.—The lemurs are very interesting as supplying transition forms between monkeys, bats, insectivora, and rodents.

**LEMURES**, or *Larvæ*, in Roman mythology, malignant spirits who were thought to haunt the earth by night and to possess great power for evil over the living. They were the spirits of bad men, and were held in much dread, while the lares or souls of the virtuous were supposed to exercise over mankind a kindly influence. According to some writers, however, the term lemures applied to all spectres of the dead, both lares and larvæ. To propitiate the latter, the Romans annually celebrated a festival in the month of May, called the *lemuria* or *lemuralia*.

**LENA**, a river of eastern Siberia, rising W. of Lake Baikal, near Irkutsk. Its direction is at first N. and then E. N. E. until it reaches Yakutsk, near lat. 62° N., lon. 130° E., where it resumes a northerly course, and preserves it until it discharges its waters through numerous mouths into the Arctic ocean. Its length is about 2,500 m., and it flows wholly within the Russian dominions. The Vitim, Aldan, and Viliui are its most important tributaries. It discharges a vast volume of water, and at

the distance of 800 m. from its mouth is 5 or 6 m. wide. It is navigable through the greater part of its course, but the surrounding country is bleak and desolate.

**LENAPES.** See DELAWARES.

**LENAU, Nikolaus**, a German poet, whose real name was NIEMBSCH VON STREHLENAU, born at Csátád, Hungary, Aug. 15, 1802, died at Oberdöbling, near Vienna, Aug. 22, 1850. He studied in Vienna, visited the United States, and resided in Vienna, Ischl, and Stuttgart. He was about to be married in 1844, when he was seized with insanity, from which he never recovered. He has been characterized as "the poet of melancholy." His most exquisite songs relate to Poland and Hungary. His larger works, the drama *Faust* (1835) and the epics *Savonarola* (1837) and *Die Albigenser* (1842), all which passed through many editions, are fine though abstruse poems, in which a lyric character predominates. He himself considered the drama *Don Juan* (1851) as his masterpiece. Anastasius Grün edited his complete works (4 vols., Stuttgart, 1855; new ed. with a biographical notice, 2 vols., 1874).

**LENAAWEE**, a S. E. county of Michigan, bordering on Ohio, and drained by Raisin and Macon rivers and several other streams; area, 735 sq. m.; pop. in 1870, 45,595. It has a rolling surface, well wooded in some places, and a fertile soil, consisting chiefly of a black sandy loam. Iron ore is found. The Michigan Southern railroad and the Detroit and Jackson branches pass through it. The chief productions in 1870 were 685,019 bushels of wheat, 964,306 of Indian corn, 402,396 of oats, 36,804 of barley, 302,402 of potatoes, 550,426 lbs. of wool, 1,467,408 of butter, 78,442 of cheese, and 68,332 tons of hay. There were 12,138 horses, 15,772 milch cows, 16,700 other cattle, 112,653 sheep, and 25,322 swine. There were numerous manufacturing establishments, including 9 of agricultural implements, 9 of brick, 38 of carriages, 1 of cars, 15 of cheese, 9 of iron castings, 11 of machinery, 2 of woolen goods, 4 breweries, 6 tanneries, 6 currying establishments, 4 planing mills, 39 saw mills, and 14 flour mills. Capital, Adrian.

**LENACAS**, a tribe of Indians occupying the high plateaus of Otoro and Intibucut, S. W. of the city of Comayagua, Honduras. They speak dialects of a language which seems to have been widely diffused through the central portions of Honduras, and which the Spaniards, following the designation of their Mexican auxiliaries, vaguely denominated Chontal, a word which signifies simply foreign or barbarous. At present the Lenacas occupy the mountain towns of Opoteca, Guajiquero, Lauteroque, Intibucut, Yamalanguira, &c., and number from 35,000 to 40,000. They are industrious, frugal, and thrifty, peaceable but brave, devotedly attached to their mountain homes, and altogether good citizens of the state.

**L'ENCLOS, Ninon or Anne de**, a French lady of pleasure, born in Paris, probably May 15, 1616,

died there, Oct. 17, 1706. Her father, a gentleman of Touraine, trained her by precept and example to a life of pleasure. She was skilled in accomplishments, and when an orphan at the age of 15 manifested precocious shrewdness in managing her property, which she so disposed of as to speedily double its value. Being beautiful, witty, and fond of cultivated society, she soon became popular in Paris, where she fixed her residence, her favors being sought by many of the most eminent men of the age. She was remarkable for being neither avaricious nor extravagant, and, with a constant succession of lovers, appears never to have depended on them for pecuniary aid. Distinguished women courted her society, and Mme. de Lafayette, Mme. de Sully, and Mme. Scarron (afterward De Maintenon) were among her friends and visitors. Christina of Sweden, during her residence in France, was warmly attached to her, and wished her to take a place in her little court, but Ninon preferred independence. She was regarded as a model of refinement and elegance in her manners. Although she led a life of pleasure far into old age, she preserved her beauty and fascination almost to the last, and is said to have had lovers for three generations in the family of Sévigné. In the works of Saint-Evremond, who was one of her lovers, are some letters by her which are the only authentic pieces from her pen, though *La coquette vengée* (Paris, 1649) and other works are attributed to her. The great Condé, La Rochefoucauld, Villars, and D'Estrées were among her most favored admirers, and the most eminent poets sang her charms. She had two sons. One, the chevalier de la Boissière, whose paternity could not be determined, rose to distinction in the navy. The other, who received from his father, the marquis de Gersay, the name of Villiers, was the victim of an unhallowed passion for his mother; he had been reared in ignorance of his birth, and at the age of 19 (his mother then being 56), on learning the secret from her lips while urging his love, he blew out his brains. This event, however, made no change in the life of Ninon, who always seemed dead to the instincts of maternal tenderness.

**LENEPVEU, Jules Eugène**, a French painter, born in Angers, Dec. 12, 1819. His first pictures were "Idyl" (1843), and "The Death of Vitellius" (1847), which latter won the Roman prize, enabling him to spend a number of years in Italy. He returned to Paris in 1853. His subsequent works comprise "The Martyrs in the Catacombs," "Pius IX. in the Sistine Chapel," and "Corpus Christi at Venice," all exhibited in 1855. His finest paintings are "A Venetian Wedding" (1857), and "Moses assisting the Daughters of Midian" (1859). In 1869 he succeeded Hesse as an academician, and in December, 1872, Hébert as director of the French school at Rome.

**LENNEP**, a town of Prussia, in the province of the Rhine, on the river Lenne, 22 m. E. of

Düsseldorf; pop. in 1871, 7,722. It has manufactory of cashmere, woollens, hats, furniture, iron ware, and powder.

**LENNEP, Jacobus van**, a Dutch novelist, born in Amsterdam, March 25, 1802, died Aug. 26, 1868. He was educated at Leyden, and produced his literary works while practising law. He is called by his countrymen the Walter Scott of Holland. His first publication was a collection of poems (1830), embodying some of the national legends. After the outbreak of the Belgian revolution he produced two political comedies, "The Frontier Village" and "The Village beyond the Frontier." He was the author of more than 50 romances, among which are: "Our Ancestors," a series of stories relating to the history of Holland; "The Rose of Dekama," translated into English by Woodley (London, 1847); and "The Adopted Son," translated by Hoskins (New York, 1847). He translated into Dutch several of the dramas of Shakespeare, and some of the poems of Southey and Tennyson. He wrote a history of northern Holland for children, a description of the old castles of Holland, and numerous operas and comedies. He also prepared a complete edition of the Dutch poet Vondel. An edition of his dramatic works was published in Amsterdam in 1852-5.

**LENNOX.** See DUMBARTONSHIRE.

**LENNOX**, a N. E. county of Ontario, Canada, bordering on the N. W. shore of Lake Ontario, just above its entrance into the St. Lawrence, and drained by the Napanee and other rivers; area, 314 sq. m.; pop. in 1871, 16,396, of whom 5,244 were of Irish, 4,649 of German, 4,349 of English, and 1,478 of Scotch origin or descent. Its S. and S. W. coast is indented by numerous inlets. The surface is diversified, and the soil, resting on beds of limestone, is very fertile. Indian corn, wheat, oats, rye, buckwheat, potatoes, and peas are the chief productions. It is traversed by the Grand Trunk railway. Capital, Napanee.

**LENNOX, Charlotte**, an English authoress, born in the city of New York in 1720, died in England, Jan. 4, 1804. Her father, Col. Ramsay, who was lieutenant governor of the colony of New York at the time of her birth, sent her to be educated in England, where she passed the remainder of her life. She married, and, having become a widow in straitened circumstances, resorted to her pen for the means of subsistence. Her chief work, "Shakespeare Illustrated" (3 vols. 12mo), is a collection of the novels and histories from which Shakespeare is supposed to have derived his plots. Among her other works are translations of "Sully's Memoirs" and "Binney's Greek Theatre," "The Female Quixote," and a variety of plays, novels, and miscellanies. She enjoyed the friendship of Dr. Johnson and Richardson, the former of whom assisted her in drawing up proposals for an edition of her works in 3 vols. 4to, which was never published. She died impoverished.

**LENOIR**, an E. county of North Carolina, traversed by Neuse river; area, 390 sq. m.; pop. in 1870, 10,434, of whom 5,532 were colored. The surface is undulating, and the soil fertile near the streams. The Atlantic and North Carolina railroad passes through it. The chief productions in 1870 were 10,332 bushels of wheat, 195,725 of Indian corn, 20,474 of peas and beans, 45,056 of sweet potatoes, 4,804 bales of cotton, and 27,690 lbs. of rice. There were 722 horses, 684 mules and asses, 1,300 milch cows, 2,422 other cattle, 1,795 sheep, and 11,441 swine; 6 flour mills, and 2 saw mills. Capital, Kinston.

**LENOIR, Charles Pélagé**, abbé, a French author, born at Créances, Marche, in 1819. He was ordained in 1841, and became a private tutor, preacher, and author. From 1857 to 1859 he edited *La Science pour Tous*. He was a friend of Lamartine, and one of the executors of the will of Proudhon, and delivered a funeral oration at the grave of Buchez. His principal works are: *Le dictionnaire des droits de la raison dans la foi* (Paris, 1860); *Sancti Alphonsi de Ligorio Theologia Moralit, ad presentem Rerum Conditionem accommodata* (4 vols., 1872); *Dictionnaire théologique de Bergier, approprié au mouvement intellectuel de la seconde moitié du XIX<sup>e</sup> siècle* (12 vols., 1872 et seq., of which he prepared 6 vols.); and *Dictionnaire des décisions romaines sur la foi, la morale et la discipline* (1873 et seq.).

**LENOIR. I. Alexandre**, a French archaeologist, born in Paris, Dec. 26, 1761, died there, June 11, 1839. He completed his studies under the painter Doyen, cultivated the drama with Talma, and wrote criticisms on paintings. He did more than any other person to preserve during the revolution the great national works of art belonging to religious establishments, by prevailing upon the authorities not to include them in the sale of other property. He saved upward of 500 renowned monuments from the fury of the mob, and was wounded in preventing the destruction of Richelieu's mausoleum in the Sorbonne. He was authorized to deposit his collection in the convent of the Petits Augustins, and he obliged the monks to surrender their art treasures. His collection became the nucleus of the celebrated *musée des monuments français*. He was also engaged in the embellishment of Malmaison and other palaces, and in the restoration of many public monuments and buildings. Lucien and Napoleon Bonaparte and Josephine promoted his undertaking, and he was the director of Josephine's private collections. His museum was closed under the restoration, and the monuments formerly belonging to churches and convents were returned to them. He continued to be employed, however, in restoring the royal vaults in the church of St. Denis, and in other works. He published numerous books, of which the principal are: *Musée des monuments français* (8 vols., Paris, 1804); *La Franc-ma-*

*connerie rendue à sa véritable origine* (5 vols., 1814); and *Nouveau essai sur les hiéroglyphes* (4 vols., 1819-'22). II. **Alexandre Albert**, a French architect, son of the preceding, born in Paris, Oct. 21, 1801. He studied under Debret in Paris and in Italy, and was the architect of a museum in the Palais des Thermes, uniting this palace with the museum of Cluny. In 1862 he became secretary of the school, and in 1869 a member of the academy of fine arts. His principal works are: *Architectur et archéologie* (Paris, 1839); *Architectur militaire au moyen âge et monuments religieux du moyen âge* (1847); and *Architectur monastique* (1852).

**LENORMAND, Marie Anne Adelaïde**, a French fortune-teller, born in Alençon, May 27, 1772, died in Paris, June 25, 1843. She was of a respectable family, but owing to the death of her father received a very incomplete education, and was for some time a seamstress. About 1790 she went to Paris, and entered a linen shop as saleswoman. In 1793 she formed a partnership with Mme. Gilbert and a baker's boy named Flammermont for the purpose of carrying on the trade of fortune-telling. Having been complained of to the police, she was arrested and imprisoned for several months. After obtaining her freedom she opened a "cabinet of divination." Her popularity was remarkable; during 40 years she was constantly visited by persons of all ranks. The court of Napoleon itself contributed much to bring her into vogue, and her ignorance and commonplace manner of divining did not injure her credit. After the fall of the empire she went to Aix-la-Chapelle, to the congress of the allied sovereigns, where she attracted much attention, especially from the emperor Alexander. She was arrested in 1809 in consequence of "indiscreet revelations," and again in 1821 for some political offence contained in a book published by her under the title of *La sibylle au congrès d'Aix-la-Chapelle*. About 1830 she sank into obscurity, and finally died at the age of 71, after predicting in one of her books that she should live to the age of 125. She became rich by her calling. She published many pamphlets, and a few books of no value with the exception of her *Souvenirs de la Belgique, cent jours d'infortune* (1822), and the *Mémoires historiques et secrets de l'impératrice Joséphine*, &c. (3 vols., 1829).

**LENORMANT. I. Charles**, a French archæologist, born in Paris, June 1, 1802, died in Athens, Nov. 24, 1859. He studied law, but during a visit to Italy became interested in archæology. In 1825 he was made inspector of fine arts; and in 1828 he accompanied the younger Champollion to Egypt, and subsequently explored the Morea. Returning to Paris, he held important positions in connection with art, antiquities, and numismatics. In 1835 he was adjunct professor to Guizot in the Sorbonne, but resigned in consequence of his alleged ultramontane views. In 1848

he was made professor of Egyptology in the collège de France. Besides many special memoirs, he wrote, separately or in conjunction with others, *Des artistes contemporains* (2 vols., 1833); *Trésor de numismatique et de glyptique* (5 vols., 1836-'50); *Élite des monuments céramo-graphiques* (4 vols., 1837-'61); *Introduction à l'histoire orientale* (1838); *Musée des antiquités égyptiennes* (1842); and *Questions historiques* (1848; 2d ed., 2 vols., 1854).—His wife, **AMÉLIE**, a niece of Mme. Récamier, acquired celebrity as a leader of fashion and by her anonymous works, among which are: *Souvenirs et correspondance tirés des papiers de Mme. Récamier* (2 vols., 1859); *Coppet et Weimar: Mme. de Staël et la grande duchesse Louise* (1862); and *Quatre femmes au temps de la révolution* (1865). II. **François**, a French archæologist, son of the preceding, born in Paris in 1835. He was educated by his father, and in 1874 succeeded Beulé as professor of archæology in the national library. He has published *Manuel d'histoire ancienne de l'orient* (in conjunction with E. Chevallier, 3 vols., 1868-'9; English ed., 2 vols., London and Philadelphia, 1869-'70); *Lettres assyriologiques et épigraphiques* (2 vols., 1871-'2); *Études accadiennes* (1873 et seq.); *La magie chez les Assyriens* (1874); *Souvenirs d'enfance et de jeunesse de Chateaubriand* (1874); and *Les premières civilisations* (1874).

**LENOX**, a town of Berkshire co., Massachusetts, on the Housatonic river and railroad, 110 m. W. of Boston and 125 m. N. by E. of New York; pop. in 1870, 1,965. The principal village is situated on the summit of a range of hills, and has a number of elegant residences. In beauty of natural scenery Lenox is not surpassed by any town in western Massachusetts, and has become a favorite summer resort. It abounds in marble of excellent quality, which has been employed in the construction of public buildings in Washington and elsewhere, and also in iron ore, and contains extensive iron works, manufactories of window and plate glass, seven public schools, including a high school, and an incorporated academy. Lenox was settled in 1750, and incorporated in 1767, receiving the family name of the duke of Richmond.

**LENS** (Lat. *lens* or *lentis*, a lentil or pea), a transparent body used for refracting light. A convex lens is usually of the form of two segments of spheres, united by their bases; such a lens is called a double convex; if the lens consist of only one segment of a sphere, that is, is spherical on one side and plane on the other, it is called a plano-convex lens. A concave lens, on the contrary, has a concavity on either side, into which part of a sphere will fit, and is called a double concave; if one side is plane and the other concave, it is called plano-concave. When one side of the lens is convex and the other concave, if the edges of the lens are thinner than the centre, it is called concavo-convex, and also a converging meniscus; if the centre of the lens is thinner than

the edges, it is called convex-concave, or diverging meniscus. Concave lenses are used in spectacles for the relief of near-sighted persons, and in the eyepiece of opera glasses and spy glasses of low power. Convex lenses are used for far-sighted persons and singly as magnifiers. They cause the rays of light which pass through them to converge toward the central line at right angles to their surfaces; so that to an eye in the right position, rays from different parts of an object make a greater angle than if they had not come through the lens. Convex lenses are also used in combination in telescopes and microscopes, in which the image formed by one lens is looked at under the magnifying power of a second. The image is formed by a convex lens, by means of its power to make the rays of light converge, which brings all the light that emanated from each point of the object again to a point in the air on the opposite side of the lens. These points of the image have nearly the same relative position as the corresponding points in the object, and may be rendered visible by being received upon smoke or vapor, or as in the camera obscura and magic lantern upon a sheet. The image in the clear air can be seen by an eye placed in a line prolonged from the object through the image. If the image be formed by a single convex lens, it will on being magnified be found to have two principal imperfections, arising from spherical and from chromatic aberration. The nature of these imperfections, and the means employed for overcoming them by the makers of optical instruments, are explained under **ABERRATION**, **ACHROMATIC LENS**, and **APLANATIC LENS**.—The material employed in the construction of lenses for optical instruments is generally crown glass which contains very little lead, and flint glass which contains much lead and has a greater refractive power. The glass should be perfectly homogeneous and free from striae. The production of such glass in masses of sufficient size to make lenses for large telescopes is a work of great difficulty. The best specimens yet produced have been from the manufactory of the Messrs. Chance of Birmingham, England, made by a process invented by Guinand, a Swiss optician, the details of which have never been made public. (See **GLASS**.)

**LENS**, a town of France, in the department of Pas-de-Calais, on the Souchez, 9 m. N. N. E. of Arras; pop. in 1866, 5,738. Lace and woollens are manufactured here, and in the neighborhood there are coal mines. In August, 1648, the French under Condé obtained here a great victory over the Spaniards.

**LENT** (Anglo-Sax. *lenoten*, Ger. *Lenz*, Dutch *lente*, spring), the springtide fast of 40 days before Easter. In the Latin church it is called *jejunium quadragesimale*, "the fast of 40 days;" and the first Sunday in Lent is called in the oldest Latin rituals *Dominica in quadragesima*, "the Sunday on the 40th day" (before Easter). Hence the almost identical appella-

tions among Latin peoples: in Italy and Portugal *quaresima*, in Spain *cuaresma*, and in France *carême* (*caresme*). Roman Catholic theologians and many Protestants maintain that this fast is, in substance, of apostolic origin; such is the opinion of St. Jerome. But the greater number of Protestants consider it to be of ecclesiastical institution. The common opinion is that it was established as a preparation for the great anniversaries of Christ's crucifixion and resurrection, and in remembrance of his fast of 40 days in the wilderness. Some authors contend that in the beginning this preparatory fast was limited to the first four days of Holy Week, embracing a fast of 40 hours, which was gradually extended to 40 days; but according to others, the fast was one of 40 days from the very first. Be that as it may, the Latin term *quadragesima* and the Greek *τεσσαρακοστή* were applied before the 4th century to a period of 40 days before Easter set apart for fasting and prayer, beginning with what is now the first Sunday of Lent, and terminating on Holy Thursday. Within this period neither Greeks nor Latins at first fasted 40 days, the Sundays and Thursdays being excepted by both, and also the Saturdays by the Greeks. As the general sentiment declared in favor of fasting 40 days, the period was lengthened both in the East and West. At Rome it became 50 days, beginning with Quinquagesima week, and in the time of Pope Melchisedes (811) it was extended to 60 days, beginning on Sexagesima Sunday. On the other hand, the Greeks began the fast on the 70th day from Easter, or Septuagesima Sunday. At length Gregory the Great (590) directed that the quadragesimal fast should begin on the 6th Sunday before Easter, and that all the intervening week days should be fasting days. As this, however, only gave 36 such days, the last four days of the preceding week were added either by that pope or by Gregory II. (715), the solemn fast thus beginning on Ash Wednesday, which thenceforward was called *caput jejunii*, "the beginning of the fast."—There is also considerable uncertainty regarding the nature of the obligation of fasting. The fasts of Holy Week seem to have been kept by all as obligatory; but the others, it is thought, were assumed as voluntary. The general custom came at length to be a general law. The council of Laodicea (about 363) prescribed entire abstinence from food on Holy Thursday and the exclusive use of "dry food" during all the fast days of Lent. The council of Orleans in 541 commanded that those who did not keep Lent should be considered as transgressing the law of the church; and the eighth council of Toledo in 646 forbade the use of flesh meat. Wine, oil, and animal food were prohibited on fasting days, and are so still in the Greek church. Their use in the Latin church was made one of the grounds of separation in the time of Photius. By degrees in the West the use of all kinds of food, except flesh,

eggs, cheese, and wine, was allowed, and became general after the 11th century; and thereafter even the use of these was permitted, flesh being alone excepted. Indeed, judging from the writings of the early fathers, the custom had been to take but one meal a day, in the evening, consisting either of "dry food" or bread and water. As the rigor of the fast was relaxed, the hour of refection was advanced from sunset to noon; and in the 13th century a slight cold collation was allowed in the evening. In the early ages also, the fast of Lent was kept with the greatest rigor by the catechumens and public penitents; by the former as a fitting preparation for their solemn baptism on Holy Saturday, and by the latter in the hope of receiving at the same time entire absolution or a mitigation of their penance. By the laws of Theodosius the Great the infliction of all species of corporal punishment was forbidden during Lent. For the same reason the council of Clermont (1095) enjoined under pain of excommunication that the universal peace called the truce of God should be observed from Ash Wednesday till Whitsuntide. In the present discipline of the Roman Catholic Church, only one meal is allowed, and at this the use of flesh meat is prohibited. Custom allows a slight refection, not exceeding two ounces in the morning, and a collation not exceeding eight ounces in the evening. This general rule is modified to suit the necessities of climate and occupation. In the United States, the use of flesh meat is allowed several times a week in accordance with the demands made by each bishop for his diocese. But fish and flesh are never allowed during Lent at the same meal. In Spain, the Spanish colonies, and Spanish America, by the payment of a trifling sum, one can purchase during Lent the privilege of the *cruzada*, which is the perpetuation of the privilege of using flesh meat on all days of abstinence granted in favor of those engaged in the crusades against the Moors, or who contributed money to assist the crusaders. In nearly all the Protestant churches of continental Europe, particularly in the Lutheran church, Lent is still a penitential season. In England Ercombert, who died in 664, made the observance of Lent obligatory in Kent. The church of England still keeps the Lenten fast on her calendar with appropriate services, as does the Protestant Episcopal church.—A curious old English custom followed in Lent was that of pelting a puppet called a Jack o' Lent, the origin of which is not explained. Ben Jonson alludes to it in his "Tale of a Tub":

—on an Ash Wednesday,  
When thou didst stand six weeks the Jack o' Lent  
For boys to hurl three throws a penny at thee.

In a ballad called "Ashton Stuff," found in a manuscript in the Ashmolean museum, occur the following verses:

Then Jake à Lent comes justlynge in,  
With the hedpeece of a herynge,

And saythe, repent yow of yower syn,  
For shama, syrs, leve yower awerynge:  
And to Palme Sunday doethe he ryde,  
With sprots and herryngs by hys syde,  
And makes an end of Lenton tyde!

The fourth Sunday of Lent is often termed Mid-Lent Sunday or Passion Sunday; it was formerly known as "Carl Sunday," and on that day beans or peas called "carlings" used to be given away or eaten. Thus an English translator (1607) gives the following passage from the *Quadragesimale Spirituale* (Paris, 1565): "After the sallad (eaten in Lent at the first service) we eat fried beanes, by which we understand confession. When we would have beanes well sooden, we lay them in steepe, for otherwise they will never seeth kindly. Therefore, if we purpose to mend our faults, it is not sufficient barely to confess them at all adventure, but we must let our confession lie in steepe in the water of meditation." In his "Colin Clout" Skelton writes:

In holy Lenton Season,  
Ye will neither Beanes nor Peason,  
But ye look to be let loose  
To a pigge or to a goose.

Lent is preceded in some countries by the dissipation of the carnival. (See CARNIVAL.) The day before Ash Wednesday is called Shrove Tuesday, because the faithful used then to confess and be shriven, in preparation for the fast. In the north of England Shrovetide is still called Fastingtide, Fastens, and Fastmass. (See HOLY WEEK, and GOOD FRIDAY.)

**LENTIL** (Lat. *lens*), an esculent seed produced by *ervum lens*, of the pea family, and used for food from the earliest times. The len-

Lentil (*Ervum lens*).

tils of Egypt used to be held in much esteem. It was a preparation of this diet which Esau exchanged for his birthright, under the name of "red pottage;" and according to Dr. Shaw, in his "Travels in Barbary," the lentils were dressed in the same manner as beans, dissolving into a

mass and making a pottage of a chocolate color. In Egypt and Syria the parched seeds are exposed for sale in the shops, and they are esteemed the best food to carry upon long journeys. On the continent of Europe its use is very common, especially by the Roman Catholics during Lent. The plant is slender and branching, with the leaves terminated by tendrils; it grows only 12 or 18 in. high, and bears small pea-like flowers in pairs, which are succeeded by pods containing from one to four round, flattened, doubly convex seeds. There are some half dozen varieties, of which the large lentil is the most productive and the common the best flavored. Considerable quantities are imported into this country, but their use is mainly confined to Europeans; lentil soup is a favorite dish with Germans. The cultivation of the lentil is very similar to that of the pea, requiring a dry, warm, sandy soil; it is sown early in May, broadcast if intended merely for fodder, but in drills if the ripe seeds are desired; as a green food for stock it is highly valued in Europe, but it has not obtained a place in our agriculture. Like other legumes, the lentil contains a great amount of nutriment, Einhoff finding in 100 parts 32.81 of starch and 37.32 of matter analogous to animal matter. The preparation sold as a food for children under the names of revalenta and ervalenta Arabica consists of lentil meal flavored with sugar and salt. Lentils are regarded as a highly nutritious and easily digestible food, but they must be deprived of their skins either before or after cooking, as these are indigestible and hurtful.

**LENTULUS**, the name of a patrician family, long prominent in ancient Roman history. **PUBLIUS LENTULUS SURA**, the chief associate of Catiline, was quæstor in 81 B. C., prætor in 75, consul in 71, and in the following year was ejected from the senate for his infamous life. Joining the conspiracy of Catiline, he became prætor again in 63, was left in command of the conspirators in the city when Catiline departed for Etruria, was detected and proved guilty by Cicero through the Allobroges, and was strangled in the Capitoline prison, Dec. 5, 63 B. C.

**LENZ, Jakob Michael Reinhold**, a German poet, born at Sesswegen, Livonia, Jan. 12, 1750, died in Moscow, May 24, 1792. He was the son of a clergyman, studied in Königsberg, and as a tutor of Russian nobles went to Strasburg, where he was an unsuccessful lover of Goethe's Friederike of Sesenheim. In 1776 he associated with Goethe, Herder, and Wieland at Weimar; but his aversion to the conventionalities of society put a speedy end to his residence there. He became insane, and ended his life in great misery. His writings, chiefly dramatic, edited by Tieck (3 vols., Berlin, 1828), reflect the "storm and pressure period" of German literature.

**LEO**, the name of twelve popes, of whom the following are the most important. **I. Leo I,**

**Saint**, surnamed the Great, born of Tuscan parents in Rome about 390, died there in November, 461. He was employed by Popes Zosimus, Celestine I., and Sixtus III. on the most important missions. In 418 he was sent to the churches of northern Africa to unite the bishops against the spread of the Pelagian doctrines; and he displayed great activity in combating the Nestorian heresy. When the dissensions between the imperial commanders in the West, Aëtius and Albinus, left Gaul and Italy exposed to the attacks of the barbarians, Leo was sent by the emperor Valentinian III. to appease the quarrel, and had just succeeded in his mission when Sixtus III. died in the summer of 440, and Leo was unanimously chosen his successor. His first efforts as pope were directed toward restoring harmony and discipline among the churches of Africa, annulling fraudulent episcopal elections in Gaul, enforcing celibacy among the clergy, and suppressing the immorality charged on the Manichæans of Italy. In 445 he held a council in Rome to judge the appeal of Celdionius, bishop of Besançon, who was declared innocent and restored to his see; and St. Hilary, archbishop of Arles, who had deposed him, was for a time deprived of his metropolitan jurisdiction. In Spain he approved of the execution of Priscillian, convicted of magic and immorality, and put to death by the usurper Maximus, and he procured the condemnation of Priscillianism by a national council of Spanish bishops. Eutyches, condemned for heresy at Constantinople in November, 448, made an appeal to Leo which was supported by the emperor Theodosius II. This led to the convocation at Ephesus, in 449, of what is known as the "robber synod," in which the partisans of Eutyches, protected by the imperial troops, excommunicated Leo, and caused or hastened the death of Flavian, patriarch of Constantinople. These violent proceedings were cancelled by the general council of Chalcedon in 451, over which Leo's legates presided, and in which his letter was accepted as the expression of orthodox doctrine. In 452, at the invasion of Italy by the Huns under Attila, the emperor Valentinian having taken refuge in Rome, and his general Aëtius having abandoned Italy to her fate, Leo with two senators went to meet Attila near Mantua, and persuaded him to accept a pecuniary ransom from the Romans, and to retire beyond the Danube. In 455, Genseric and an army of Vandals having come to Rome at the invitation of the empress Eudoxia, the mediation of Leo could only obtain a promise that the lives of the citizens should be spared, together with three churches, which served as an asylum while the rest of the city was sacked. All the treasures of Rome having been carried to Africa with her chief citizens, the pope devoted himself to redeeming the captives and relieving the manifold distress of his flock. He also used his influence with the court of Constantinople to quell the religious

troubles caused in Egypt and Syria by the partisans of Eutyches.—Besides a large collection of sermons, there remain 173 letters of St. Leo on ecclesiastical matters addressed to contemporary sovereigns, bishops, and councils. Quesnel attributed to him the treatise *De Vocatione Gentium*, considered by some to belong to St. Prosper, and by others to St. Ambrose. Of the numerous editions of his works, the principal are those by Pasquier Quesnel (2 vols. 4to, Paris, 1675), Cacciari (2 vols. fol., Rome, 1753-'5), and Ballerini (3 vols. fol., Verona, 1755-'7). See also Dumoulin, *Vie et religion de deux bons papes, Léon I. et Grégoire I.* (Paris, 1650); Maimbourg, *Histoire du pontificat de St. Léon* (1687); Arendt, *Leo der Grosse und seine Zeit* (Mentz, 1835); Perthel, *Pabst Leo's I. Leben und Lehren* (Jena, 1843); Saint-Chéron, *Histoire du pontificat de St. Léon le Grand et de son siècle* (2 vols., Paris, 1846). **II. Leo III., Saint**, born in Rome about 750, died there, June 11, 816. He was educated in the monastic school attached to the Lateran palace, was cardinal-priest of Santa Susanna, and distinguished for his learning and eloquence, when he succeeded Adrian I., Dec. 25, 795. He immediately wrote to Charlemagne to renew the relations which existed between the latter and Pope Adrian, confirmed the title of *patricius*, senator or protector of Rome, bestowed upon Charlemagne's father Pepin by Pope Stephen III., and received in return a portion of the spoils won from the Avars by Charlemagne. At the time of Leo's election Rome was visited by Offa, king of the Mercians, who increased the revenues of the English college founded at Rome by Ina (died 728), and which was supported by a tax originating with these princes, which afterward received the name of "Peter pence." On April 25, 799, while present on horseback at the solemn procession in honor of St. Mark, Leo was attacked by an armed band led by two priests, Paschal and Campolo, nephews of Adrian I., who, after attempting to put out his eyes and cut out his tongue, imprisoned him in a neighboring convent. Having been delivered by the citizens, he took refuge in Spoleto, and thence went to Paderborn, where Charlemagne received him with honor, and gave him a numerous escort of bishops, counts, and armed men to accompany him on his return to Rome. The two priests who had made the assault on him were then tried and banished to France. Toward the close of the year 800 Charlemagne, after expelling the Saracens from the Balearic islands, went to Rome, where a council of bishops examined the charges brought against Leo by the exiled assassins, and declared the pope's innocence. On Christmas day Charlemagne was anointed emperor of the West by Leo. In 804 the pope visited the emperor at Aix-la-Chapelle, and prevailed on him to restore the full liberty of canonical elections, to prevent those called *chorepiscopi* from exercising episcopal powers or conferring

holy orders, to forbid churchmen from bearing arms, and to enforce the obligation of residence for bishops. The council of Aix-la-Chapelle in 809 having approved the custom established in Spain and followed by the Frankish monks of Palestine, of inserting the words *Filioque* in the Nicene creed, the decision of the council was submitted in 810 to Leo, who advised the discontinuance of the custom. He had the Nicene creed engraved in Greek and Latin, without the addition *Filioque*, on silver tablets, which were hung up near the Confession of St. Peter. In 815 a new conspiracy was discovered, and its authors were put to death. The sentence and its hasty execution were censured by the new emperor Louis le Débonnaire. In 816, an earthquake having ruined several towns in Italy, and thrown down a church in Rome, Leo in order to propitiate the divine wrath established the solemn litanies and processions known as the Rogations. Leo III. is praised by his contemporary Anastasius the Librarian for his munificence in building and adorning churches. Thirteen letters of this pontiff are extant in Labbe's *Concilia*, vol. vii. Hermann Conring published his *Epistole ad Carolum Magnum* (4to, Helmstedt, 1647). **III. Leo IV., Saint**, born in Rome about 800, died there, July 17, 855. He was educated in the monastery of San Martino, became a member of the community, was selected by Gregory IV. as one of his domestic prelates, and created a cardinal by Sergius II. He was unanimously elected pope Jan. 30, 847, without the customary notice being sent to the emperor, because the city was threatened by Saracen pirates. They had just ravaged the environs of Rome, and sacked the basilicas of St. Paul without the wall and St. Peter on the Vatican, carrying away the silver and gold which decked St. Peter's tomb. Leo, aided by the emperor, enclosed the Vatican with fortifications. (See LEONINE CITY.) In 849, while the work was still in progress, the Saracens landed a great force at Ostia. The pope armed every man in Rome and the neighborhood, obtained auxiliary troops from Gaëta and Naples, and sallied forth at their head in his priestly robes. A fearful storm came to the aid of the Romans; the Saracen fleet was scattered or wrecked, and the invaders were utterly routed. The rich booty recovered by the victors helped the pope to complete the entire circuit of the walls of Rome. The city of Porto was also rebuilt by Leo for purposes of defence in 852, and peopled by a colony of Corsicans, whom the Saracens had driven from Bastia. On Dec. 8, 853, he held in Rome a council of 67 bishops, in which canons were enacted for the discipline of the clergy and the instruction of the people in the knowledge of gospel truth. Two letters of Leo's are extant in Labbe's *Concilia*, vol. viii. **IV. Leo X.** (GIOVANNI DE' MEDICI), born in Florence, Dec. 11, 1475, died in Rome, Dec. 1, 1521. He was the second son of Lorenzo the Magnificent, destined for the church

at his birth and before his eighth year appointed by Louis XI. of France abbot of Font-Douce, and by Pope Sixtus IV. abbot of Passignano and prothonotary apostolic. At 18 he was created cardinal by Innocent VIII., whose son, Francesco Cibo, had married in 1487 Madalena, Giovanni's sister. No pains were omitted by Lorenzo to make his son worthy of his rank in the church. He graduated in theology and canon law at the university of Pisa, assumed for the first time the insignia of the cardinalate March 9, 1492, and went immediately to Rome, whence he was recalled to Florence a few weeks afterward by the death of his father. He fixed his residence there as legate of the holy see, opposed the election of Alexander VI. in August, 1492, and then returned to Florence. In 1494 he and his brothers were expelled by the citizens, and after living five years an exile and fugitive, he quitted Italy in 1499, and visited Germany, the Netherlands, and France, seeking everywhere the acquaintance of the learned. He returned to Rome in 1503, and lived there in retirement, making his house the resort of the most distinguished artists and men of letters in Italy. On the accession of Julius II. he was employed in the most important affairs. In 1506 he was appointed governor of Perugia, and subsequently legate of Bologna and commander of the papal troops in league with Spain against the French in Italy. In this capacity he was present at the battle of Ravenna, April 11, 1512, and was taken prisoner, but allowed to escape. The French having been driven out of Lombardy, Cardinal de' Medici employed the Spanish arms to reinstate his family at Florence. He was elected to succeed Julius II., March 11, 1513, received priest's orders March 15, was consecrated bishop on the 17th, was crowned on the 19th, and took possession of the Lateran April 11. Louis XII., who had been excommunicated and whose kingdom had been laid under an interdict by Julius II., was more than ever bent on conquering Lombardy. In March, 1513, he had signed at Blois a treaty with the Venetians, by which they promised to aid him in obtaining possession of Milan. The new pope instantly formed a counter treaty with Henry VIII., signed at Mechlin April 5, to which the emperor Maximilian, Ferdinand of Aragon, and the Swiss cantons acceded, and which resulted in the defeat of the French at Novara, June 6. This warlike activity of Leo X. seemed in contradiction to the policy announced on the day after his election to King Sigismund I. of Poland, to whom he wrote to urge him to make peace with Albert of Brandenburg, alleging that he was sending legates to all Christian nations to dissuade them from making war on each other. Before his coronation, too, he chose as his secretaries the illustrious scholars Bembo and Sadoleto, and bestowed his first care on reconstructing the Roman gymnasium or university, founded by Eugenius IV., re-

vived and liberally endowed by Alexander VI., and neglected by the warlike Julius II. In 1514 it already counted 100 professors, the most eminent scientific body in Europe, teaching every branch of sacred and profane science, including medicinal botany for the first time. In 1513 Leo purchased on the Esquiline hill a large property on which he founded the Greek institute, and established a Greek press, encouraging at the same time the culture of all the oriental languages, and paying out of his own purse for the printing of Sante Pagnino's version of the Bible, and of Piero Valeriano's key to Egyptian hieroglyphics. He also enlarged the patronage extended to the fine arts by Julius II. He obtained the release from prison of the conspirators against his own family at Florence, called to Rome and protected there Piero Soderini their chief, as well as Machiavelli, and restored to favor and public life the Colonnas, disgraced under his predecessor. He reopened the fifth general council of Lateran, April 27, 1513, with great magnificence (see LATERAN, COUNCILS OF), and declared it to be his intention to continue its sessions until the establishment of a general peace among the princes of Christendom. He made his brother Giuliano de' Medici general of the papal armies, his nephew Lorenzo governor of Florence, and his cousin Cardinal Giulio de' Medici (afterward Clement VII.) archbishop of that city. At the same epoch King Emanuel of Portugal sent him a splendid embassy to offer him the first fruits of Albuquerque's conquests in the East Indies; and Leo in return conferred on Emanuel the investiture of the conquered countries. Louis XII. after the battle of Novara was reconciled with the pope, who induced him to become the ally and brother-in-law of Henry VIII., and agreed not to oppose by open force his pretensions to the duchy of Milan. Louis secretly pledged himself to expel the Spaniards from Naples; and a matrimonial alliance was arranged between the pope's brother Giuliano and Filiberta of Savoy, aunt of the duke d'Angoulême. The latter prince, on his accession as Francis I., Jan. 1, 1515, assumed the title of duke of Milan, and gained on Sept. 13 the memorable victory of Melegnano (Marignano). This was followed by a treaty with the pope, who gave up to Francis Parma and Piacenza, Bologna being annexed to the Papal States, and the authority of the Medici reestablished in Florence. Leo and Francis met in Bologna in December, 1515, and agreed upon a concordat, afterward promulgated in the Lateran council, March 16, 1517. By this the king repealed the pragmatic sanction of Bourges (1438), guaranteed to the pope the collection of annates and tithes, and obtained the right of nomination to all episcopal sees and principal benefices in France. Francis vainly interceded for the duke of Urbino, who, guilty of rebellion against Julius II. and Leo himself, had killed with his own hand in the open street Cardinal Alidori,

archbishop of Pavia. The duchy of Urbino was subsequently bestowed on Lorenzo de' Medici, the pope's nephew, after whose death it reverted to the church. Siena was also annexed; but the measures adopted for this purpose gave rise to a conspiracy against the life of the pontiff, in which Cardinal Petrucci, whose family were sovereigns of Siena, and several other members of the sacred college were implicated. Petrucci was strangled in prison, June 3, 1517, and the others were condemned to pay enormous fines. In order to bind the college of cardinals more securely to his person, Leo created 31 new cardinals, most of whom were Florentines. The treaty of Noyon, concluded between France and Spain, Aug. 13, 1516, was intended to be a definitive settlement of the affairs of northern and southern Italy, in direct opposition to the pope's policy. Leo endeavored to counteract this settlement by the treaty of London, Oct. 29. But the emperor Maximilian by becoming a party to both defeated Leo's purpose; while the treaty of Fribourg made by Francis I. with the Swiss cantons, Nov. 29, deprived the pope of his most faithful allies. During the treacherous peace which followed this settlement and the conspiracy of Petrucci, Leo and his cardinals displayed their taste for magnificence and the encouragement of literature and art. The council of the Lateran was closed with great solemnity in 1517; and a bull was published urging all Christian princes to form a league against the Turks, and granting indulgences to all who joined in the crusade, or contributed toward paying its expenses. The building of the new basilica of St. Peter's was pushed forward; and the lavish expenditure of the pope having exhausted his treasury, an indulgence was offered to all who would give money toward the construction. This occasioned the quarrel in Germany between the Augustinian monk Martin Luther and the Dominicans, and led step by step to the reformation. Leo, who looked upon the first movements of this great religious revolution as a quarrel between monks, who also admired Luther's genius and wished to conciliate him, summoned him, Aug. 7, 1518, to appear in Rome within 60 days; but irritated him by ordering the legate at the imperial court to examine him in Germany, and, if found heretical in doctrine and refractory, to send him a prisoner to Rome. The compromise effected by the conference of Augsburg only made Luther appeal from the pope misinformed to the pope better informed; and when Leo's bull of Nov. 9, 1518, defined the right of the Roman pontiff to grant indulgences and explained their nature, Luther appealed from the bull to a general council. At the solicitation of the kings of Hungary and Poland, whose dominions were continually threatened by the Turks, he sent the most eminent among his cardinals to the European courts to advise the formation of a common league against the foes of Christendom. He

submitted to the sovereigns the plan of a combined attack by land and sea against the Turkish empire, he himself promising to sail from Ancona with 100 armed vessels to join the allied fleets. At the same time he proclaimed a general truce for five years, which was accepted by the sovereigns; but nothing more than a defensive league was effected between England, France, and Spain, with the pope at its head, which served to check temporarily the advance of the Turks. Leo made a second effort to conciliate Luther, and a conciliatory letter from Luther was answered by a pacific one from Rome. But public theological discussions revived the zeal of the reformer, and a bull was at length issued, June 15, 1520, condemning his writings as heretical. This Luther burned publicly at Wittenberg, Dec. 10. In 1521 the cause of the American Indians was brought to Leo's tribunal by both Franciscans and Dominicans, the former endeavoring to justify the Spanish system of reducing them to slavery. Leo condemned the system, and employed his utmost endeavors to prevail on the king of Spain to repress it. In April, 1518, Leo gave his nephew Lorenzo, duke of Urbino, in marriage to a relative of the French king, and in return had to surrender the cities of Reggio and Modena. From these nuptials sprung Catharine de' Medici, queen of France. At the death of the emperor Maximilian, Jan. 12, 1519, Leo sent his own relative Cardinal Orsini to Francis I. to urge him to oppose the election of Charles of Spain, and, if possible, to secure the nomination of some inferior German prince. Orsini failed in his main purpose; Francis used his utmost endeavors and even open bribery, but only to secure the imperial crown for himself. Charles V., however, was elected emperor, June 28, and immediately demanded the pope's permission, as the public jurisprudence of the age required, to retain his Spanish possessions together with the imperial title. The pope having assented in spite of the remonstrances of the French king, the latter determined on war. It appears certain that Leo resolved at this juncture to execute Julius II.'s project of expelling from Italy both French and Spaniards, by taking advantage of the dissensions between the two monarchs. He sent 150,000 gold crowns to Switzerland, and obtained a body of 6,000 Swiss auxiliaries; proposed to Francis I. to unite with him in an attack upon the kingdom of Naples; stipulating that Gaëta and the whole Neapolitan territory north of the Garigliano should be given to the church, that the remainder should be held for the second son of Francis, then an infant, and that an apostolic nuncio should govern for him till his majority. Francis meanwhile permitted the pope's Swiss auxiliaries to pass through the Milanese to the Romagna and the march of Ancona. Perugia was at this time forcibly annexed to the Papal States, and an attempt was made on Ferrara. Francis, divining the

pope's real design, broke off the pending negotiations, and Leo openly united his forces with those of the emperor for the avowed purpose of wresting from the French the duchy of Milan and Genoa. By a treaty concluded with Charles V., May 8, 1521, Francesco Sforza was to be restored to his dominions, Parma and Piacenza were to be given back to the church, and the emperor was to aid the pope in annexing Ferrara, and to bestow the duchy of Cività di Penna in the kingdom of Naples on the son of the late duke of Urbino. The treaty was not made public till July 8. Prospero Colonna with the Spaniards from Naples joined the papal forces at Bologna, crossed the Po at Casalmaggiore, and joined the Swiss, whose countrymen in the French service now deserted to the papal standard. After a series of successes the allied army entered Milan Nov. 19; Parma and Piacenza were next occupied; but the duke of Ferrara defended his dominions to the last extremity against the spiritual and temporal arms of the pontiff. Leo received the intelligence of the capture of Milan and the recovery of Parma and Piacenza on Nov. 23. Amid the rejoicings consequent on these events he felt a sudden indisposition on the 24th, which excited no alarm, and died unexpectedly on Dec. 1, it is said without the sacraments of the church. His death has been by some writers attributed to poison; but nothing certain about its cause or manner is found in authentic contemporary accounts.—The character of Leo has been judged with more prejudice and discrepancy than that of almost any other person known in history. He has been accused of political insincerity, of adding treachery to injustice in his annexation of neighboring states, of an inordinate anxiety for the aggrandizement of his family, and of many failings which, however readily pardoned in a great prince, become odious in a Christian priest. But whatever estimate we form of his foreign policy, it must be acknowledged that he governed his own subjects with wisdom and justice, and his reign was long gratefully remembered by the Romans as an era of happiness and prosperity. Engaging and affable in manners, gay or dignified as occasion demanded, and gifted with great powers of conversation, he charmed all with whom he came in contact. His private life both before and after his elevation to the throne was chaste and decorous. He was generous to excess, magnificent in his tastes, passionately fond of the chase, but temperate in the pleasures of the table. Though not a profound scholar, and accused of neglecting the studies best fitted to his station, he was well versed in the lighter branches of literature and a proficient in the art of music. He delighted above all things in the society of artists, poets, and learned men. He increased the Vatican library, and restored the celebrated library of his family (the Laurentian at Florence), which had been plundered and dispersed at the time of their expulsion.

He employed Michel Angelo and Raphael in the execution of some of their greatest works. His munificence might well entitle the reign of Leo X. to rank as the golden age of Italian art and letters. "Happy is it for the world," says Roscoe, "when the pursuits of such individuals, instead of being devoted, through blind ambition, to the subjugation or destruction of the human race, are directed toward those beneficent and generous ends which, amid all his avocations, Leo the Tenth appears to have kept continually in view." See Audin, *Histoire de Léon X.* (2 vols. 8vo, Paris, 1844), and Roscoe's "Life and Pontificate of Leo X." (6th ed. revised, 2 vols. 8vo, London, 1853). **V. Leo XII.** (ANNIBALE DELLA GENGA), born in the territory of Spoleto, Aug. 2, 1760, died Feb. 10, 1829. Before his elevation to the pontificate he was papal nuncio at several German courts, and was sent to France on a special mission by Pius VII., whom he succeeded in the papacy, Sept. 28, 1823. He governed the church with a firmness which involved him in disputes with France and Austria, and administered the affairs of his temporal dominions with great zeal for the good of his subjects. He exerted himself to suppress brigandage and mendicity, promote education and literature, and suppress secret societies. He published a jubilee for the year 1825, and in a circular letter to the Christian nations attacked Bible societies. He entered into negotiations with the republics of South America for the purpose of filling up the many sees left vacant during their wars with Spain; organized in a most efficient manner the Sapienza university in Rome, and regulated its five faculties of theology, law, medicine, philosophy, and philology; increased the number of professors, and raised their salaries. He manifested the design of reforming thoroughly church and state, and published in October, 1824, a *motu proprio* or decree reorganizing the administration of the Papal States. He corrected abuses in the convents and monasteries of Rome, and established order and security by means of a good police.

**LEO I., Flavius**, surnamed the Thracian and the Great, a Byzantine emperor, born in Thrace about A. D. 400, died in January, 474. At the death of Marcian in 457 he was only a military tribune; but being proclaimed emperor by the soldiers, the choice was confirmed by the senate, and he was crowned by the patriarch Anatolius, this being the first instance of a prince receiving his crown from the hands of a bishop. He continued the measures of his predecessor against the Eutychians in Alexandria, successfully encountering the opposition of his minister, the Arian chief Aspar, by whose influence he had been raised to the throne. In 466 the Huns invaded Dacia and threatened the eastern empire, but were defeated by the generals of Leo, their principal chief Dengizec, a son of Attila, being killed. In 468 he concerted with Anthemius, the emperor of the West, an ex-

pedition against Genseric, king of the Vandals in Africa. Under the command of Basiliscus more than 1,000 ships, each with 100 men, came to land near Carthage, but were attacked by night with fire ships, and the whole fleet was destroyed or dispersed. This disastrous result was charged upon Aspar, who with one of his sons escaped from a popular tumult only to be assassinated by a band of the emperor's body guard within the precincts of the palace. The Arian followers of Aspar encouraged the intrigues of Ricimer in the West, and incited the Goths to invade Thrace, and for two years to threaten Constantinople. Among the extraordinary events of this reign were the destruction of Antioch by an earthquake (458), a conflagration in Constantinople (465), immense and destructive inundations (469), and an eruption of Vesuvius (472), which, according to all the historians, was not only felt at Constantinople, but caused showers of ashes which covered the roofs of houses with a coat three inches thick.

**LEO III., Flavius**, surnamed the Isaurian, a Byzantine emperor, born in Isauria about 680, died June 18, 741. The son of a farmer who emigrated from Asia Minor to Thrace, he joined the army under Justinian II., was rapidly promoted, and in 713 was appointed by Anastasius II. to the supreme command of the troops in Asia, where he held the field against the Saracens. When in 716 the crown was seized by Theodosius III., Leo declared him a usurper, outwitted and avoided the Arab general Muslima, marched upon Constantinople, forced him to resign (March, 718), and became himself master of the empire. The Saracens immediately appeared with an immense army and fleet before Constantinople. This siege, under Omar II., the third by the Saracens, lasted two years, and so powerful were the Mohammedan armaments that the provinces expected the downfall of Leo, the western kingdoms heard that a caliph had ascended the Byzantine throne, and two schemes of rebellion were plotted, which were quickly suppressed when the triumph of the emperor was known. The Arab fleet was routed in two engagements, and partially consumed by the Greek fire, and few of the ships regained the harbors of Syria. In 726 Leo promulgated an edict for the removal of images from all the churches of the empire, and thus inaugurated the party of the iconoclasts, and a conflict of nearly 120 years. He was opposed by Germanus, patriarch of Constantinople, John the Damascene, and John Chrysorrhous in the East, and by Popes Gregory II. and III. in the West. The iconoclasts were condemned in 732 by a council assembled at Rome; an expedition sent by the emperor into Italy to reduce the cities opposed to the edict failed in its object, and the exarchate of Ravenna was transferred from the Greeks to the Lombards (734). In the East, there was a rebellion in the Peloponnesus and the Cyclades, and a re-

volt in the capital, the latter of which was quelled only after much bloodshed. The professors in the schools of Constantinople favored the use of images, and the emperor is said to have therefore ordered the library of St. Sophia to be burned. It is more probable, however, that this library of 36,000 volumes was accidentally destroyed in some conflagration. After the check which his forces experienced in Italy, he transferred Greece and Illyria from the spiritual authority of the popes to that of the patriarchs of Constantinople. The latter years of his reign were occupied with violent wars with the Saracens. An adventurer, who claimed to be Tiberius, a son of Justinian II., was supported by the caliph, and made his entry into Jerusalem in the garb of a Roman emperor. In 739 the Arab general Solymán invaded the Roman territories with 90,000 men, in three divisions, but retreated into Syria after the defeat of one of the bodies in a pitched battle in Phrygia. In 740 an earthquake caused calamities throughout the empire, demolishing a part of the walls of Constantinople, and destroying whole towns in Thrace and Egypt.

**LEO V., Flavius**, surnamed the Armenian, a Byzantine emperor, reigned from 813 to 820. He was of noble Armenian descent, distinguished himself as a general under Nicephorus I. (802-811), was exiled for treachery, but soon recalled by Michael I., and appointed commander of the troops in Asia. Michael was chiefly unpopular as the husband of the masculine and presuming Procopia, and his downfall and the elevation of Leo had been foretold by an Asiatic prophetess. In 813 Leo and the emperor led an expedition against the Bulgarians, and were defeated in a battle near Adrianople. Michael withdrew to Constantinople, leaving a disaffected army under the command of Leo, who was the secret cause of the defeat, and whose friends now persuaded the soldiers to proclaim him emperor. The rebel army marched toward the capital, and to avoid civil war Michael resigned to the conspirators the keys of the city and the palace, and retired to a convent. The Bulgarians immediately appeared before Constantinople, desolated its suburbs, captured Adrianople, and reduced Thrace to a desert, but suffered a terrible defeat by Leo at Mesembria in 814. In 815 he invaded their territory, obtained a truce for 30 years, and by his fierce onsets left such an impression on these hereditary enemies of the Byzantine empire that they remained quiet during 74 years. Educated in a camp, he reformed the civil government by introducing into it the strictness of military discipline, and his incessant oversight and formidable punishments improved the administration both in the capital and the provinces. He protected the iconoclasts, and his severity against the advocates of images created numerous enemies. Michael the Stammerer had contributed largely to his elevation, and had been his staunch ad-

herent, but after repeated warnings was found guilty of treason, and was sentenced to death. On the day appointed for his execution a band of priests and chanters was admitted into the palatial chapel to sing matins. A body of conspirators, friends of Michael, mingled with this procession, in the ecclesiastical habit, with swords under their robes, and at a given signal they rushed upon the emperor, who perished at the altar, after bravely defending himself with the great cross.

**LEO VI., Flavius**, surnamed the Philosopher, a Byzantine emperor, born about 865, ascended the throne in 886, died in 911. He was associated with his father Basil I. in the government two years before he succeeded him. Narrowly escaping from a false accusation of parricide made by the minister Santabaren and the patriarch Photius, he began his reign by banishing one of them and deposing the other. From 887 to 891 he warred against the Saracens in Asia Minor and Italy. The mismanagement of the prime minister Stylianus, who disregarded the privileges of Bulgarian merchants, occasioned a severe war with that people, which Leo terminated in 894 by involving the Bulgarians in hostilities with the Hungarians. The inactivity of the emperor exposed him to a series of conspiracies, and invited new attacks by the Saracens, who in 904 captured and plundered Thessalonica. In 911 they defeated the Greek fleet near Samos. Leo combined the legislative and executive powers in his own person, and extinguished the last remains of the authority of the senate. He was excluded from the communion of the faithful on account of his fourth nuptials, the Greek church tolerating only a second marriage. His title of Philosopher he received for having written several works on theological and profane subjects. The "Basiliacs," or imperial constitutions, being a Greek translation and revision of Justinian's *Corpus Juris*, with the addition of subsequent constitutions, were begun under Basil I., and completed under Leo and Constantine Porphyrogenitus. The principal writings attributed to Leo are 33 orations, chiefly on the theological subjects, an important treatise on military tactics, and a work on "Oracles," in which the fates of the empire are foretold by the arts of astrology and divination.

**LEO, André**, a French novelist (who adopted the Christian names of her twins as her *nom de plume*, her real name being **LÉONIE CHAMPEIX**), born at Champagné, Vienne, about 1832. She is the daughter of M. Béra, a naval officer, and she married in 1851 Pierre Grégoire Champseix, a socialistic publicist, who then lived in exile at Lausanne, and who died in Paris, Dec. 4, 1863. Her principal works are: *Le mariage scandaleux* (1863); *Une vieille fille et les deux filles de M. Plichon* (1864); *Le divorce*, and *Jacques Galleron* (1865). She also appeared as a lecturer on social questions and on woman's rights, and during the siege of Paris in 1870-'71 she was one of the most im-

passioned speakers in political clubs. In conjunction with Mme. Jaclard, wife of a member of the commune, she founded in March, 1871, *La Sociale* newspaper. She was under arrest for a short time at Versailles after the overthrow of the commune, and subsequently went to Switzerland, where she took a prominent part in the meetings of the internationale.

**LEO, Heinrich**, a German historian, born in Rudolstadt, March 19, 1799. He was educated at Breslau and Jena, and went to Berlin in 1822, where he was an enthusiastic disciple of Hegel. In 1824 he published *Entwicklung der Verfassung der lombardischen Städte*. In 1830 he was elected professor of history in the university of Halle, which post he still held in 1874. In 1863 he was made perpetual member of the Prussian house of lords. In early life he vigorously defended Hegelianism and political liberalism, and in later years as earnestly opposed them. His principal controversial writings against liberal tendencies are: *Herr Dr. Diesterweg und die deutschen Universitäten* (1836); *Sendschreiben an Görres* (1838); *Die Hegelingen* (1838); and *Signatur Temporis* (1849). He has also written several works pertaining to Germanic and Celtic antiquities. He has contributed largely to the *Evangelische Kirchenzeitung* and other periodicals. Among his more important historical works are: *Handbuch der Geschichte des Mittelalters* (1830); *Geschichte der italienischen Staaten* (5 vols., 1829-'30); *Zwölf Bücher niederländischer Geschichte* (2 vols., 1832-'5); *Lehrbuch der Universalgeschichte* (3d ed., 6 vols., 1849-'53); *Leitfaden für den Unterricht in der Universalgeschichte* (4 vols., 1838-'40); and *Vorlesungen über die Geschichte des deutschen Volks und Reichs* (5 vols., 1854-'67).

**LEO AFRICANUS** (originally **AL-HASSAN IBN MOHAMMED**), a Moorish traveller, born in Granada, Spain, about 1485, died about 1526. While he was a child, his parents removed to Africa, and settled at Fez, then a magnificent Mohammedan city. At the age of 16 he accompanied his uncle on a mission to Timbuctoo, and remained there four years. Afterward he explored various parts of the kingdoms of Fez and Morocco, and journeyed among the wild Arab tribes of the desert. In 1513 he visited the kingdoms of Tlemcen and Algiers. On his return from this journey, which extended to Tunis and the desert of Barca, he went to Timbuctoo for the second time, and thence proceeded 400 miles southward as far as the city of Gago. Thence turning to the eastward, he traversed Bornoo and Nubia, and visited the ruins of Thebes. From Egypt he travelled into Turkey, Persia, and other oriental countries, but we have no narrative of his adventures there. Returning by sea from Constantinople, he was captured by Christian corsairs and carried to Rome in 1517. Here he was presented to Pope Leo X., who bestowed upon him a handsome pension, had him instructed in the principles of Christianity, and gave him

his own name. From this time he resided chiefly at Rome, and having mastered the Italian language was made professor of Arabic. Here he wrote his famous description of Africa, composed in Arabic, and after his death published in Italian. Ramusio, who issued this version in his *Raccolta*, asserts that he died at Rome; but Widmanstadt, a German orientalist of the 16th century, states that after the death of his patron he returned to Tunis, where he again embraced the Mohammedan faith. The merit of his great work on Africa has been universally acknowledged, and Ramusio remarks that no previous writer has given so accurate a description of that part of the world. The best Latin version is that of the Elzevirs (1632).

**LEOBEN**, a town of Austria, in the province of Styria, on the Mur, and on the Vienna and Trieste railway, 10 m. W. S. W. of Bruck; pop. in 1870, 5,091. The inhabitants are mostly engaged in mining and forging iron, and it is the seat of a famous school of mines. The preliminary treaty between the French republic and Austria, which terminated Napoleon's second Italian campaign, and was followed by the peace of Campo Formio, was concluded here, April 18, 1797.

**LEOBSCHÜTZ**, a town of Prussia, in the province of Silesia, capital of the mediatised principality of Jägerndorf, which belongs to the prince of Liechtenstein, 34 m. S. of Oppeln; pop. in 1871, 10,689. It has a castle, four churches, and a gymnasium. There is an active trade in grain and flax, and 2,000 persons are employed in woollen knitting.

**LEOCHARES**, an Athenian sculptor, who flourished about the middle of the 4th century B. C. He was one of the artists employed by Artemisia of Caria on the tomb of her husband Mausolus. He was also one of those engaged by Philip of Macedon to execute memorials of his victory at Chæronea; but his masterpiece was his bronze statue of the "Abduction of Ganymede by the Bird of Jove," of which the best extant copy is at Rome. His statue of "Zeus Ceraunius" was also very celebrated.

**LEOMINSTER**, a borough of England, in Herefordshire, on the Lugg, 13 m. N. N. W. of Hereford, on the railway to Shrewsbury; pop. in 1871, 5,865. Here the Leominster canal, which is 10 m. long and issues from the Severn at Stourport, enters the Lugg. It has a grammar school, an ancient church, and a house of industry. Among the principal manufactures are leather, gloves, and hats.

**LEOMINSTER**, a town of Worcester co., Massachusetts, on the Nashua river, and on the Fitchburg and the Boston, Clinton, and Fitchburg railroads, 38 m. W. N. W. of Boston; pop. in 1870, 3,984. It is the chief seat of the comb manufacture of the state, and contains also paper and piano factories, two large cabinet shops, an extensive manufactory of children's carriages, a national bank, 17 public schools,

including a high school, a weekly newspaper, and five churches.

**LEON. I.** A N. county of Florida, bordering on Georgia, and bounded W. by Ockloconee river; area, 900 sq. m.; pop. in 1870, 15,236, of whom 12,341 were colored. It has an undulating surface and productive soil. It is traversed by the Jacksonville, Pensacola, and Mobile railroad and its branch to St. Marks. The chief productions in 1870 were 258,432 bushels of Indian corn, 34,035 of sweet potatoes, 6,518 bales of cotton, 43 hogsheads of sugar, and 27,099 gallons of molasses. There were 427 horses, 1,296 mules and asses, 1,625 milch cows, 3,919 other cattle, and 6,299 swine; 3 saw mills, and 1 railroad repair shop. Capital, Tallahassee, which is also the capital of the state. **II.** An E. central county of Texas, bounded E. by Trinity river, and W. by the Navasoto; area, 1,100 sq. m.; pop. in 1870, 6,523, of whom 2,708 were colored. The soil on the uplands is a sandy loam, and in the bottoms a rich black loam. The chief productions in 1870 were 160,906 bushels of Indian corn, 24,505 of sweet potatoes, 44,998 lbs. of butter, and 4,897 bales of cotton. There were 2,405 horses, 5,263 milch cows, 1,414 working oxen, 18,041 other cattle, 1,116 sheep, and 19,512 swine. Capital Leona.

**LEON. I.** A former kingdom of Spain, now mainly divided into the provinces of Leon, Zamora, and Salamanca (area, 15,240 sq. m.; pop. in 1870, 881,940), bounded N. by Asturias, E. by Old Castile, S. by Estremadura, and W. by Portugal and Galicia. The principal rivers are the Douro and its tributaries, but a small portion of the N. W. part is drained by affluents of the Minho. The climate is mild in spring, hot in summer, and excessively cold in winter. Leon was anciently a part of the Roman province of Hispania Tarraconensis. After the destruction of the Gothic monarchy by the Arabs in the beginning of the 8th century the foundations of the kingdom of Leon were laid by Pelayo and Alfonso I. of Asturias, but Ordoño II. (913-'23) was the first to assume the title of king. In the 11th century it was united to Old Castile, and after a short separation reunited in the 13th. (See SPAIN.) **II.** A province of Spain, comprising the N. part of the ancient kingdom, bordering on the provinces of Oviedo, Palencia, Valladolid, Zamora, Orense, and Lugo; area, 6,166 sq. m.; pop. in 1870, 350,092. The N. and W. parts are rugged and mountainous, but in the E. are wide undulating plains, well adapted for agriculture, where wheat, maize, hemp, and flax are produced abundantly, and the vine is successfully cultivated. Iron, lead, antimony, coal, and marble are found in the mountains, but iron only is mined to any extent. There are few manufactures and little trade. The principal towns are Leon, the capital, Astorga, and Almansa. **III.** A city, capital of the province, at the junction of the Torio with the Bernesga, 180 m. N. N. W. of Madrid; pop. about 10,000. It is built

on the slope of a hill, which is crowned by the cathedral of Santa Maria de Regla, a noble Gothic edifice, originally founded in the 12th century. The town is surrounded by an octagonal wall, with 11 gates. The streets are generally narrow and irregular, but a few of them are handsome, and there are several public squares ornamented with fountains. Among the noteworthy public buildings are the church of San Isidoro, the convent of San Marcos de Leon, the town house, court house, episcopal palace, palace of the civil governor, and several hospitals. The manufactures are linen goods, leather, hats, and earthenware. Leon was founded by the Romans, who called it Legio, from the seventh legion, quartered there in the time of Augustus.

**LEON**, a city of Mexico, in the state of Guanajuato, capital of a district of the same name, on the right bank of the Rio Torbio, 100 m. N. W. of Mexico; pop. about 100,000 (second only to that of the capital). It stands in a fertile valley about 6,000 ft. above the sea, has good streets, and is generally well built. In the principal square, little inferior to any other in the republic, stand the old governor's palace, the handsome parish church, and a picturesque arcade with numerous fine shops. There are several other churches, three convents, a hospital, and a Latin and several primary schools. This city, one of the most flourishing and industrious in Mexico, has an extensive commerce in wheat and other grains. Some cotton and woollen stuffs are manufactured, but the chief industry is tanning.—Leon was founded in 1576, and made a city in 1836; but its commercial importance does not date beyond 1855, about which time it became the chief entrepot of the fertile region of the Bajío.

**LEON**, a city of Nicaragua, in the plain and capital of the department of the same name, 53 m. N. W. of Managua; pop. about 25,000. The streets are good, and some are paved and lighted; the houses are mostly of one story; the public edifices are numerous and spacious, but not remarkably handsome. The cathedral, from the tower of which are visible the 13 volcanoes of the Sierra de los Marrabios, though occupying an entire block, is less imposing than the churches of Calvary and La Merced; besides these there are 12 other churches. In the principal square are the old and new episcopal palaces, the old government house, university, and barracks. The antique convents of La Merced and La Releccion are converted into public offices, and a third into a hospital. A ravine, separating Guadalupe from the city proper, is crossed by a grand bridge, and other bridges were to be completed in 1874. In the surrounding country, which is very picturesque, mineral and thermal springs abound; and good roads lead from the city in every direction. Some dressed leather and cutlery are manufactured, and a few articles are exported through the port of Corinto on the Pacific.—Leon was founded in 1523 by Francisco F. de Cordoba,

on the W. shore of Lake Managua; but a series of calamities necessitated its transfer in 1610 to its present site, adjoining the ancient Indian village Subtiaba, which, with 6,000 inhabitants, and forming a distinct municipality, is separated from it by a single street. In 1823, 1,000 houses were burned in one night. The ruins of Old Leon are still visible.

**LEON, Isla de.** See CADIZ.

**LEON, Ponce de.** See PONCE DE LEON.

**LEONARDO DA PISA**, or **Leonardo Bonacci** or **Bonacci**, an Italian mathematician, born in Pisa about 1170; the year of his death is unknown. He is also called **FIBONACCI**, an abbreviation of *Filius Bonacci*. Little is known of him beyond what can be gathered from his mathematical works. His father placed him when very young in charge of a master who taught him the Arabic (or, as he calls it, the Indian) system of arithmetic, and he seems to have devoted the greater part of his life to the study of that science. Though the Arabic system was known in Europe previous to the time of Bonacci, yet he greatly extended that knowledge, and according to some he was the first to introduce algebra into Europe. He travelled in Egypt, Syria, and other countries, for the purpose of learning the different systems of arithmetic in use, and came to the conclusion that the Arabic or Indian method surpassed all others. His principal work is *Liber Abaci*, the word *abacus*, the name of a well known instrument used in calculation, being employed by him, in accordance with the custom of his time, to denote arithmetic in its most general sense. He was also the author of works on the Diophantine analysis and geometry, all of which give evidence of great mathematical genius. A splendid edition of the *Liber Abaci* was published at Rome in 1857, edited by B. Boncompagni, to whom the modern world is indebted for its knowledge of the works of Bonacci.

**LEONARDO DA VINCI.** See VINCI.

**LEONHARD, Karl César von**, a German geologist, born at Rumpelheim, near Hanau, Sept. 12, 1779, died in Heidelberg, Jan. 23, 1862. He was educated at Marburg and Göttingen, was employed in making several scientific journeys in different parts of Germany, and until 1814 held important offices in the administration of the principality of Hanau. Retiring from the service of the state to devote himself exclusively to study, he became in 1816 member of the Bavarian academy of sciences, and in 1818 professor of mineralogy and geology in the university of Heidelberg. His works in this department of science are very numerous, the latest being *Grundzüge der Mineralogie* (2d ed., 1860). From 1830 to 1858 he edited, in conjunction with Bronn, the *Jahrbuch für Mineralogie, Geognosie, Geologie und Petrefactenkunde*.—His son **GUSTAV**, born in Munich, Nov. 22, 1816, is professor in the university of Heidelberg, and has published several works upon mineralogy and geology, among which are *Die Mineralien Badens nach*

*ihrem Vorkommen* (2d ed., 1855), and *Grundzüge der Geognosie und Geologie* (2d ed., 1863).

**LEONIDAS**, king of Sparta, son of King Anaxandrides, and the 17th of the family of the Agides, killed at the battle of Thermopylæ, 480 B. C. He married Gorgo, daughter of his half brother Cleomenes, whom he succeeded as king in 491. When Athens and Sparta resolved to resist the invasion of Xerxes, Leonidas led the Spartan forces, and gained immortal glory, fighting and falling heroically with his chosen band. (See THERMOPYLÆ.)

**LEONINE CITY** (*Città Leonina*, and *Borgo*), the name given to that portion of Rome comprising the Vatican basilica and palace with the surrounding suburb, which Leo IV. (847-'55) enclosed with a wall. In the time of Leo III. (795-816) the frequent descents made by the Saracens on the coast of Italy inspired that pontiff with the design of securing against their attacks the churches and religious establishments outside the walls of Rome. Shortly before his accession to the pontificate the Saracens ascended the Tiber and plundered the basilica of St. Peter on the Vatican and that of St. Paul without the wall. Leo III. having informed the emperor Lothaire of this, the latter encouraged him to enclose these churches within the circuit of the walls, and sent large contributions in money from himself and his brothers for that purpose. Leo consulted the Romans, called in the peasants from the Campagna, and labored for four years (848-'52) in constructing the fortifications round the Vatican and the adjoining suburb, which he connected with the city. A tax was also levied on the entire duchy of Rome to defray the cost of the work. This part of Rome was hence called the Leonine City. It was still further fortified and embellished by Nicholas V. (1447-'55). It was the district inhabited by the Anglo-Saxon pilgrims during the early ages; hence the name of Sassia applied to it afterward. It also contains the Giraud palace, built by Bramante, which was the residence of the English ambassador before the reformation.

**LEOPARD** (*felis leopardus*, Linn.), a carnivorous mammal of Africa and India, often confounded with the African panther (*F. pardus*, Linn.), but of smaller size, paler yellow color, and with more numerous rows of spots. It is very graceful, slender, and active, the body being about 38 in. long, the tail 27, and the height 26; the ground color of the fur is tawny yellow, whitish below, the sides and back with numerous circles formed of from three to five spots of black; the head, fore quarter, and limbs marked with irregularly shaped spots; the color within the circles being darker renders them more distinct; according to F. Cuvier, ten of these ringed spots can be counted in a perpendicular line from the back to the under parts. The leopard inhabits thick forests, preying upon antelopes, deer, and mammals of similar size, and even sheep, hares, and wild and domestic fowls; being an excellent climber,

it resorts to trees in pursuit of game or for safety; it is taken in traps, or shot from trees into which it has been pursued by dogs. It is frequently seen in captivity, and occasionally breeds in confinement, being gravid nine weeks, and the young born blind. This animal is con-

*Felis leopardus*.

sidered by many authorities as the same with the panther, and by equally good ones as distinct. (See PANTHER.)—The hunting leopard of Africa (*felis jubata*, Schreb.), which Wagler has elevated to a genus *cynailurus*, is a very interesting animal, having the colors and appearance of the larger spotted cats, and yet with a form and a susceptibility of being trained like the dog, so much so that Cuvier calls it a canine cat. The color is bright tawny yellow, covered with full, round, black spots equally distributed; there is a mane of longer hair on the neck; the legs are longer than in the

African Hunting Leopard (*Felis jubata*).

leopard, and the claws are not retractile; the length is 3½ ft. With the strength, suppleness, teeth, and powerful jaws of the cats, it wants their sharp claws and ferocious disposition; it is easily tamed, and is trained to chase deer like a hound; the hair has a crisp-
